INTRODUCTION

University College of Business (UCB) in Albania is organizing XIIth International Scientific Conference entitled:

"Digital Transformation and Artificial Intelligence: Economic, Legal and Social Perspectives"

through the contribution of its three main units:

- Faculty of Economics, Law and Social Sciences;
- Faculty of Engineering and Computer Science
- College of Higher Professional Studies.

This event comes as one of the forms of expression of cooperation between the parties through the development of Scientific Research in multidisciplinary fields such as: economics, justice, education, social-political sciences and professional studies.

An important contribution to the organization and development of this conference is made by the collaborating partners, Higher Education Institutions in the country, the region and Europe:

1. University of Skopje – North Macedonia
2. B2 Ljubljana School of Business – Slovenia
3. Jan Dlugosz University in Czestochowa – Poland
4. Baltic International Academy - Latvia
5. Institute for Applied Business Studies - Albania
6. Euro College – North Macedonia
7. Helena Chodkowska University of Technology and Economics - Poland
8. Zagreb School of Business – Croatia
9. Daran Center - Albania

The theme represents one of the most important developments of our time. The advancement of digital technologies andthe widespread integration of artificial intelligence is transforming the way economies, institutions, and modern societies operate. The digitization of processes, automation, and the large-scale use of data are creating new models of economic development and institutional organization.

However, these developments also bring significant challenges, which require in-depth scientific analysis, such as the legal regulation of new technologies, data protection, cybersecurity, and the impact of artificial intelligence on the labor market and social relationships. For this reason, addressing digital transformation requires a multidisciplinary approach that would link the economic, legal, and social perspectives.

The conference aims toserve as an academic platform for researchers, academics, andprofessionals from various fields to discuss the developments, challenges, and opportunities related to digital transformation and artificial intelligence, contributing to the advancement of scientific research and academic debate on this current and far-reaching topic.

SCIENTIFIC BOARD:

- Prof.Dr. Ylber Bezo, **Rector, University College of Business, Tirana, Albania**
- Prof.Dr. Leandro Haxhi, Lecturer, University College of Business, Tirana, Albania
- Assoc. Prof. Dr. Ardi Bezo, Vice-Rector, University College of Business, Tirana, Albania
- Prof. Dr. Ace Milenkovski, Rector, University of Skopje, North Macedonia
- Prof. Dr. Marcin Sosnowski, Vice Rector, Jan Dlugosz University, Czestochowa, Poland
- Prof. Dr. Vladislav Volkov, Vice Rector, Baltic International Academy, Riga, Latvia
- Prof.Dr. Shpetim Cami, Secretary General, University College of Business, Tirana, Albania
- PhD Justyna Żylińska, Rector of the Helena Chodkowska University of Technology and Economics, Warsaw, Poland
- PhD Ireneusz Fura, Dean, Helena Chodkowska University of Technology and Economics, Warsaw, Poland
- Prof. PhD Krzysztof Półtorak, Dean of the University of Technology and Economics, Warsaw, Poland
- Prof. Dr. Remzi Keco, Dean of FEA, Agricultural University of Tirana, Tirana, Albania
- Prof. Assoc.Dr. Lidija Weis, Dean, B2 Ljubljana School of Business, Ljubljana, Slovenia
- Prof. Assoc.Dr. Enis Fita, Dean FEDSHS, University College of Business, Tirana, Albania
- Prof. Dr. Vjollca Bakiu, Dean of FISHK, University College of Business, Tirana, Albania
- Prof. Assoc.Dr. Miranda Kullolli, KSLP, University College of Business, Tirana, Albania
- Prof. Assoc.Dr. Katarina Aškerc Zadravec, Deputy Dean, B2 Ljubljana School of Business, Ljubljana, Slovenia
- Dr. Ing. Karolina Grabowska, Vice-Dean, FST, Jan Dlugosz University, Czestochowa, Poland
- Prof. Assoc.Dr. Drakuli Lumi, KSLP, University College of Business, Tirana, Albania
- Prof. As. Dr. Ina Pagria, Lecturer, FEA, Agricultural University of Tirana, Tirana, Albania
- Assoc. Prof. Dr. Lorena Bezo, Lecturer, FE, University of Tirana, Tirana, Albania
- Assoc. Prof. Dr. Serdan Kervan Vice-Rector, 'Uksin Hoti' University, Prizren, Kosovo
- Prof. Dr. Flutura Kalemi, Lecturer, FEA, Agricultural University of Tirana, Tirana, Albania
- Assoc. Prof. Dr. Jona Mulliri, FEA, Agricultural University of Tirana, Tirana, Albania
- Dr. Irsida Dinoshi, FEDSHS, University College of Business, Tirana, Albania
- Dr.Matilda Meta, FEDSHS, University College of Business, Tirana, Albania
- Dr. Renato Preza, FISHK, FEDSHS, University College of Business, Tirana, Albania
- Dr. Blerta Moçka, FEA, Agricultural University of Tirana, Tirana, Albania
- Dr. Elva Leka, Lecturer, Polytechnic University of Tirana, Albania
- Mr. Savo Efremovski, Euro College, Kumanovo, North Macedonia
- Dr. Petrushevski Ljubisha, Euro College, Kumanovo, North Macedonia
- Goran Luburić, MA, Dean, Zagreb School of Business, Zagreb, Croatia
- Dr. Ismet Voka - Lecturer, FEDSHS, University College of Business
- Neven Šipić, MS, Vice Dean, Zagreb School of Business, Zagreb, Croatia
- Dr. Blerta Moçka, FEA, Agricultural University of Tirana, Tirana, Albania
- Dr. Marija Stojanova, Euro College, Kumanovo, North Macedonia

- Tanja Grmuša, PHD, Assistant professor, Zagreb School of Business, Zagreb, Croatia
- Dr. Ledia Sula - Lecturer, FEDSHS, University College of Business
- Dr.ing, professor Zhanna Tsaurkubule, Baltic International Academy, Riga, Latvia

ORGANIZING COMMITTEE:

Dr. Irsida Dinoshi - Chairperson
Dr. Matilda Meta – Deputy Chairperson
Dr. Renato Preza - Deputy Chairman
Dr. Andi Mehmeti - Member
Dr. Viliem Kurtulaj - Member
Dr. Marsela Musabelliu – Member
Dr. Cand. Endrit Elezi – Member
Dr. Cand. Enea Qose - Member
Dr. Cand. Erjola Shehu - Member
Dr. Cand. Eni Danaj – Member
Dr. Cand. Bledi Bezo – Member
Dr. Cand. Olta Lami - Member
Msc. Armand Tanasica - Member

Abstract

Student mobility, joint programmes, and transnational education are usually assessed through quantitative indicators such as participation rates, mobility flows, and economic contribution. However, these measures do not fully capture how internationalisation supports the circulation of academic and professional know-how across higher education systems. This study asks how mobility, joint degrees, and transnational education function as mechanisms of knowledge transfer between the European Higher Education Area (EHEA) and the United States, and how different institutional logics shape this process. Methodologically, the article adopts a conceptual comparative approach based on policy documents and scholarly literature on internationalisation, tacit knowledge, and cross-border higher education. The analysis shows that the EHEA tends to organise know-how circulation through portability, recognition, and interoperability, while the United States more often supports it through longer-term degree mobility, institutional immersion, and partnership-based internationalisation. The study finds that mobility generates not only the transfer of explicit knowledge, but also the circulation of tacit, pedagogical, professional, and institutional know-how. Joint programmes and transnational education further intensify these processes by enabling co-production, hybridisation, and redistribution of knowledge beyond physical mobility alone. The article concludes that internationalisation should be understood as knowledge infrastructure rather than only movement across borders. It recommends that higher education policies move beyond numerical mobility targets and strengthen recognition systems, institutional learning, and diversified channels of know-how circulation.

Keywords: *student mobility; knowledge transfer; joint programmes; transnational education; tacit knowledge*.

1. Introduction

International student mobility is one of the most visible dimensions of higher education internationalization. It is commonly assessed through quantitative indicators such as student numbers, inbound and outbound flows, duration of study abroad, and economic contribution to host institutions and national systems (OECD, 2023). While these measures remain important, they capture only part of mobility's significance. When mobility is viewed mainly through statistics, its deeper academic and professional value can be overlooked.

Mobility is not simply the movement of students across borders. It also enables the circulation of knowledge, competences, pedagogical approaches, and academic cultures between institutions and systems. From this perspective, its value lies not only in physical relocation but in the transfer and transformation of know-how. Its most durable outcomes are often cognitive, epistemic, and professional rather than purely geographical (Teichler, 2017).

The European Higher Education Area (EHEA) provides an important context for examining this dynamic. Through the Bologna Process, the EHEA introduced structural instruments such as comparable degree cycles, qualifications frameworks, and the European Credit Transfer and

Accumulation System (ECTS), making mobility easier to organize, recognize, and embed in academic pathways (European Commission, EACEA, & Eurydice, 2024). Erasmus+ has reinforced this framework by integrating credit recognition, learning agreements, and quality assurance into the design of mobility itself (European Commission, 2025). In this context, mobility has become less an exceptional interruption and more a normalized component of higher education.

The United States represents a different but equally influential model. Unlike the coordinated policy architecture of the EHEA, the US system has developed largely through institutional autonomy, competitive recruitment, and federal immigration regulation. International mobility has therefore been shaped more by degree-seeking enrolment, research training, and campus-based academic immersion than by a shared regional framework (Altbach & de Wit, 2021). These differences matter because they reflect distinct institutional logics that shape how knowledge is acquired, shared, and embedded.

This article shifts attention from mobility flows to knowledge dynamics. It examines student mobility, joint degrees, and transnational education (TNE) as mechanisms through which disciplinary knowledge is expanded and recontextualized, pedagogical and research practices are exchanged, professional competences are developed, and tacit forms of knowledge are internalized. At the institutional level, mobility also supports the diffusion of administrative practices, quality assurance norms, and academic routines across systems.

This perspective is especially relevant in a changing global context. Visa restrictions, security concerns, and geopolitical tensions have affected established mobility patterns, particularly those linked to major sending countries such as China and India (Institute of International Education [IIE], 2025; Marginson, 2022). These developments are often framed in terms of recruitment volatility or financial risk, but they also reshape research collaboration, talent circulation, and longer-term processes of knowledge exchange. Mobility is therefore not only about who moves, but also about which forms of expertise, practice, and academic relationship continue to circulate.

Methodologically, this article offers a conceptual comparative analysis rather than an empirical study based on original fieldwork or a new dataset. It draws on policy documents, comparative higher education scholarship, and literature on internationalization, tacit knowledge, and cross-border provision in order to examine how different internationalization architectures shape know-how circulation across the EHEA and the United States. Its original contribution lies in reframing mobility not primarily as movement, exchange volume, or market activity, but as knowledge infrastructure through which know-how is generated, transferred, hybridized, and transformed.

2. Conceptual Framework: Defining Know-How in Higher Education Mobility

Understanding student mobility, joint degrees, and transnational education requires moving beyond administrative and logistical descriptions. Internationalization is not only about the movement of students, programmes, or institutions across borders. It is also a process through which knowledge is produced, circulated, translated, and reshaped. In this article, the concept of know-how is used to capture that broader process.

Although the term appears frequently in policy and institutional discourse, it is less clearly theorised in higher education research. Here, know-how is understood as a multidimensional form of knowledge that includes explicit and codified content as well as tacit, experiential, professional, and institutional learning. This draws on the distinction between codified and tacit knowledge developed by Polanyi (1966) and extended in work on knowledge creation and organizational learning (Nonaka & Takeuchi, 1995). In higher education mobility, what

circulates is not only information or curriculum content, but also ways of learning, conducting research, interacting academically, and organizing institutions.

Several dimensions of know-how are especially relevant. First, mobility exposes students to different disciplinary traditions, conceptual frameworks, and epistemic assumptions. Students do not simply encounter new course content; they also engage with different understandings of what counts as valid knowledge and how it should be produced or assessed (Teichler, 2017). Second, mobility involves pedagogical know-how. Teaching styles, assessment methods, expectations of participation, and norms of independent learning vary across systems and shape how students understand academic quality, authority, and success (de Wit et al., 2015).A third-dimension concerns research and methodological competences, particularly at postgraduate and doctoral level, where mobility may provide access to different laboratory cultures, supervisory models, research infrastructures, and data practices (Altbach & de Wit, 2021). A fourth dimension involves professional and employability-related competences. International learning environments often strengthen transversal skills such as adaptability, intercultural communication, teamwork, and problem-solving, all of which are increasingly valued in academic and professional settings (OECD, 2023). A fifth dimension is tacit knowledge. Much of what students gain through mobility is difficult to formalize: confidence in unfamiliar environments, the ability to manage ambiguity, awareness of informal norms, and the capacity to build and use networks. These forms of learning are rarely listed in programme specifications, yet they often shape longer-term academic and professional trajectories (Polanyi, 1966).

Know-how also exists at the institutional level. Mobility, joint degrees, and TNE enable institutions to exchange and adapt practices related to curriculum design, quality assurance, student support, digital delivery, and partnership governance (Knight, 2013). Internationalization therefore operates not only through individual learning, but also through organizational learning and institutional change.

Table 1 summarizes the main dimensions of know-how circulation across mobility, joint degrees, and transnational education.

Table 1. Dimensions of Know-How Circulation across Mobility, Joint Degrees, and TNE

Know-how dimension	What it includes	Mobility (credit or degree)	Joint programme degrees	Transnational education (TNE)
Disciplinary and academic	theories, content, conceptual frameworks	Strong exposure through host curriculum	Very strong through integrated curriculum across institutions	Strong, via imported curriculum models
Pedagogical	teaching styles, assessment culture, learning norms	Strong, through lived classroom experience	Very strong, through negotiated hybrid pedagogies	Strong, through programme design and platform practices
Research and methods	supervision models, lab practice, data cultures, methods	Medium to strong, especially at postgraduate level	Very strong, through joint supervision and shared research environments	Medium, depending on model and level
Professional and employability	transversal skills, sector orientation, project work	Strong, depending on integration and duration	Strong, often with explicit competence outcomes	Medium to strong, depending on local labour-market links

Tacit knowledge	confidence, networks, informal norms, identity shifts	Strong, especially through immersion	Very strong, through repeated cross-system navigation	Medium, but stronger where teamwork and faculty mobility are included
Institutional	quality assurance, student support, curriculum governance	Indirect but significant	Strong, because co-design requires institutional learning	Strong, because institutional routines are transferred and adapted

Seen in this way, mobility should not be understood as a simple linear transfer from one institution to another. Rather than assuming that students return with knowledge unchanged, this article treats mobility as an interpretive process in which learners encounter new settings, translate these experiences through prior knowledge, adapt to unfamiliar expectations, and later diffuse these practices into new environments. This perspective helps explain why mobility often generates not only transfer, but also recombination, epistemic pluralism, and hybridization.

Joint programme degrees intensify these processes because they embed knowledge circulation directly into programme design. Unlike short-term exchange mobility, joint degrees integrate shared curricula, coordinated learning outcomes, cross-institutional supervision, and multiple pedagogical traditions within a single academic structure. They therefore generate co-produced know-how. Academic content, teaching methods, and evaluation practices are not simply transferred between partners, but negotiated and constructed through collaboration (Knight, 2013). In the EHEA, this is facilitated by Bologna instruments such as ECTS, qualifications frameworks, and recognition tools, which provide a degree of interoperability across national systems (European Commission, EACEA, & Eurydice, 2024). In the United States, by contrast, joint and dual degree structures tend to be partnership-specific and institution-driven, reflecting a more decentralized system (Altbach & de Wit, 2021).

Transnational education further complicates the picture because it partly decouples knowledge circulation from physical mobility. Through branch campuses, validated programmes, franchised provision, and digital or blended delivery, TNE enables curriculum models, pedagogical approaches, and quality practices to move across borders even when students do not (Knight, 2013). This shifts attention from the mobility of people to the mobility of academic practices, assessment regimes, and institutional routines. Internationalization increasingly operates through knowledge flows as much as through human flows (de Wit et al., 2015).

Reframing mobility through know-how also changes how impact should be evaluated. Rather than focusing only on participation rates, destinations, or duration abroad, analysis must also consider cognitive transformation, competence development, professional pathways, institutional learning, and the diffusion of practices across contexts. This supports growing critiques of mobility frameworks that rely too heavily on numerical targets while underestimating qualitative and epistemic outcomes (OECD, 2023; Teichler, 2017).

For comparative purposes, placing know-how at the center of analysis makes it possible to examine how different internationalization architectures shape learning and circulation processes in the EHEA and the United States. The issue is not hierarchy, but difference: each system organizes the circulation of know-how through distinct institutional and policy logics.

3. Mobility as a Vector of Know-How Circulation (EHEA and USA)

Student mobility is one of the clearest ways in which academic and professional know-how circulates across higher education systems. Although it is organized through policy frameworks and institutional strategies, its effects are ultimately realized through individual learning, adaptation, and competence development. Seen in this way, mobility is not only a pattern of cross-border movement, but also a process through which knowledge is encountered, translated, and embedded in new settings (Teichler, 2017).

This perspective makes comparison between the EHEA and the United States especially useful. The two systems support mobility through different institutional designs, and these differences shape the form, depth, and durability of know-how acquisition.

One important dimension is academic know-how. Mobility exposes students to alternative disciplinary traditions, curriculum structures, and epistemic assumptions. In the EHEA, these experiences are often structured through the Bologna Process, which supports mobility through shared degree cycles, recognition tools, and ECTS. This framework helps integrate mobility into normal academic progression by making periods abroad more legible and transferable across institutions (European Commission, EACEA, & Eurydice, 2024). In this sense, European mobility tends to emphasize curricular interoperability and academic portability.

In the United States, mobility follows a different pattern. International students are more often degree-seeking than credit-mobile, which typically leads to longer periods of immersion within a single institution (IIE, 2025). Rather than moving through a coordinated regional framework, students are integrated into a specific campus environment with its own disciplinary culture, academic expectations, and research infrastructure. This can produce a deeper form of institutional immersion, especially where teaching, research, and student life are closely linked (Altbach & de Wit, 2021). If the EHEA model often prioritizes mobility across systems, the US model tends to priorities integration within one institution.

Mobility also serves as a channel for pedagogical know-how. Students do not simply study different content abroad; they learn to function within different classroom cultures, assessment systems, and expectations of academic autonomy. Even within Europe, students may move between lecture-based, seminar-oriented, and project-based traditions, encountering substantial pedagogical variation within a formally harmonized space (Teichler, 2017). In the US context, students often encounter pedagogical cultures marked by continuous assessment, participation-based evaluation, and strong emphasis on discussion, critical engagement, and the integration of teaching with research (Altbach & de Wit, 2021).

A further dimension concerns tacit knowledge. Some of the most significant effects of mobility are not easily formalized in credits or transcripts. Students develop the ability to navigate unfamiliar academic norms, manage uncertainty, build informal networks, and adapt to new social and intellectual environments. These processes reflect what Polanyi (1966) describes as tacit knowledge: forms of understanding that are embodied, situational, and difficult to codify. Marginson (2022) suggests that such experiences can produce cognitive reframing, as students reassess both their prior educational experiences and their future academic or professional identities.

Comparison between the EHEA and the United States is revealing here as well. Shorter, credit-based mobility in the EHEA may generate repeated cycles of adjustment across several contexts. By contrast, longer-term degree mobility in the United States may support deeper immersion in one setting, though usually with fewer repeated transitions. Both models can strengthen cognitive flexibility and long-term adaptability, but they do so through different rhythms of exposure and integration.

Mobility also contributes to professional know-how. International learning environments are associated with the development of transversal competences such as communication, teamwork, initiative, resilience, and intercultural collaboration (OECD, 2023). In the EHEA, these outcomes are increasingly linked to employability agendas and lifelong learning frameworks (European Commission, 2025). In the United States, mobility may connect more directly to research-intensive environments, internships, and innovation ecosystems, particularly in fields such as STEM, business, and technology (IIE, 2025). These outcomes are not uniform, however. Their strength depends on duration, field of study, institutional context, and access to research, mentoring, and labour-market networks.

Although mobility is experienced at the individual level, its effects also extend to institutions. Mobile students carry expectations about pedagogy, assessment, research practice, and student support. As institutions respond to increasingly diverse student populations, they often adapt their own practices in return. In the EHEA, mobility has helped normalize learning outcomes-based curriculum design, credit recognition, student-centered teaching, and quality assurance convergence (European Commission, EACEA, & Eurydice, 2024). In the United States, internationalization has influenced curriculum design, diversity strategies, research collaboration, and the development of global partnerships (Altbach & de Wit, 2021).

Taken together, these differences point to distinct but complementary mobility logics. The EHEA often supports structured recognition, credit portability, and recurrent shorter-term exchanges across multiple institutions. The US model more often supports degree-oriented pathways, longer stays, and stronger institutional immersion. Neither model should be treated as inherently superior. What matters is that they organize knowledge circulation differently: one prioritises interoperability across a coordinated regional space, while the other often prioritises deep integration within autonomous institutions.

4. Joint Programme Degrees: Co-Production and Integration of Know-How

Joint programme degrees represent one of the most developed forms of international academic collaboration in higher education. Unlike conventional mobility, in which students spend a limited period abroad and then return to their home institution, joint degrees integrate more than one higher education system within a single programme structure. Their significance lies not only in enabling movement across institutions, but also in creating conditions for the co-production and integration of know-how across curricular, pedagogical, and organisational boundaries (Knight, 2013).

This makes joint degrees analytically significant. They do not simply add an international component to an existing programme. Instead, they embed internationalization into the curriculum architecture itself. Shared curricula, coordinated learning outcomes, cross-institutional teaching, joint supervision, and integrated assessment transform mobility from an optional or supplementary experience into a constitutive element of the degree pathway (European Commission, EACEA, & Eurydice, 2024).

The contrast between the EHEA and the United States is especially revealing. In the EHEA, the Bologna Process has created a framework that supports the development of joint degrees through relatively high levels of structural interoperability. Instruments such as ECTS, qualifications frameworks, and diploma supplements make it easier to recognize study periods, align degree structures, and translate academic achievement across national systems (European Commission, 2025). These tools do not eliminate complexity, but they reduce friction that can otherwise limit collaboration.

In the United States, joint and dual degree programmes are usually developed through institution-specific partnerships rather than through a shared supranational architecture.

Recognition and coordination are therefore often negotiated locally rather than supported by a regional framework. At the same time, the autonomy of US institutions can create greater flexibility in curriculum design, partnership formation, and programme innovation (Altbach & de Wit, 2021). The result is a difference in how academic integration is organized and sustained.

Joint degrees are particularly important because they create spaces in which academic know-how is co-produced rather than merely transferred. Participating institutions must reconcile differences in disciplinary traditions, curriculum sequencing, pedagogical assumptions, assessment cultures, and academic standards. This negotiation is not merely administrative. It shapes the intellectual content of the programme itself. What students study, how they are taught, and how learning is evaluated emerge through collaborative design rather than unilateral export from one system to another (Knight, 2013).

For students, this often means engaging with multiple epistemic frameworks within a single degree experience. They may encounter different methodological traditions, contrasting assumptions about disciplinary boundaries, and varied expectations regarding academic performance and scholarly communication. Such exposure can strengthen epistemic flexibility, interdisciplinary capacity, and critical reflexivity (Teichler, 2017).

A similar process occurs at the pedagogical level. Joint programmes require coordination among faculty and partner institutions not only around content, but also around teaching and assessment. In practice, this often produces hybrid learning cultures that combine elements of different academic traditions. Students in these environments gain more than subject-specific expertise. They also develop awareness of how learning itself is structured differently across systems.Joint degrees also intensify the circulation of tacit knowledge. Because they often involve sustained engagement with multiple institutions, they require repeated transitions across academic and cultural settings. Students must learn to navigate different administrative routines, communication styles, informal academic norms, and expectations of scholarly behavior. Compared with short-term exchange mobility, joint programmes may therefore generate deeper and more sustained processes of transnational academic socialization.The effects of joint programmes are not limited to students. They also produce institutional know-how. Delivering a joint degree typically requires partner institutions to engage in curriculum innovation, quality assurance coordination, administrative problem-solving, digital integration, and sustained academic dialogue. Through this process, institutions learn from one another and often revise their own internal practices (Knight, 2013).

In the EHEA, these collaborations have contributed to wider convergence around learning outcomes, recognition cultures, and quality assurance practices, even when national differences remain significant (European Commission, EACEA, & Eurydice, 2024). In the United States, collaborative degrees often stimulate strategic partnerships, interdisciplinary programme development, and broader forms of global engagement (Altbach & de Wit, 2021).A comparative reading suggests that the EHEA and the United States support different but complementary models of know-how integration. The EHEA benefits from stronger recognition infrastructure and policy-supported interoperability, whereas the US context offers greater institutional flexibility and scope for innovation through locally designed collaboration. Each enables the co-production of know-how, but through different structural logics.

5. Transnational Education (TNE): Know-How Circulation Beyond Physical Mobility

Transnational education (TNE) has reshaped international higher education by weakening the traditional link between knowledge circulation and the physical movement of students. In conventional mobility models, students travel abroad to access new academic environments. In

TNE, by contrast, programmes, curricula, pedagogical practices, and institutional models' cross borders, allowing forms of know-how to circulate even when students remain in their home context (Knight, 2013).

TNE includes a wide range of arrangements in which teaching, learning, or qualifications are delivered across national borders. These include branch campuses, validated or franchised programmes, joint and dual awards, online provision, blended delivery, and other partnership-based models (Knight, 2013). What these formats share is that they relocate educational structures rather than students alone.

From the perspective of know-how circulation, this is a significant development. TNE enables the movement not only of curriculum content, but also of pedagogical models, institutional routines, quality assurance practices, and forms of faculty expertise. In this sense, TNE is not simply a delivery mechanism. It is also a channel through which academic, pedagogical, and organizational know-how is redistributed and adapted across systems (de Wit et al., 2015).

The EHEA provides one important setting for understanding this process. Within Europe, TNE operates in a context shaped by Bologna principles, recognition mechanisms, and quality assurance coordination. The emphasis on comparable qualifications, transparent learning outcomes, and portability of achievement creates conditions that support cross-border provision and reduce uncertainty in recognition (European Commission, EACEA, & Eurydice, 2024). In this context, TNE often complements mobility rather than replacing it. Blended models are increasingly common, allowing students to combine virtual or locally delivered international learning with shorter periods of physical mobility (European Commission, 2025).

The United States presents a different model. There, TNE has generally developed through institution-driven strategies rather than through supranational policy coordination. US institutions have pursued branch campuses, offshore delivery, international partnerships, and online global education initiatives as part of broader efforts to expand international presence and reach new student markets (Altbach & de Wit, 2021). This reflects structural features of the US system, especially institutional autonomy, flexible programme design, and a more market-oriented logic of expansion. At the same time, the effectiveness of TNE as a channel of know-how circulation depends heavily on quality assurance, local contextualization, and the extent to which academic collaboration is substantive rather than merely distributive.

TNE should not, however, be understood as a simple replication of a home institution abroad. Cross-border delivery usually requires substantial adaptation. Curricula often need to be contextualized, teaching practices adjusted, regulatory frameworks respected, and academic expectations translated into local settings (Knight, 2013). As a result, TNE frequently produces hybrid know-how rather than direct transfer.

This is one of the most important analytical contributions of TNE. It shows that knowledge circulation is not confined to travel-based internationalization. International exposure can also occur through digitally mediated classrooms, cross-border teamwork, internationally co-taught modules, and virtual collaboration formats (de Wit et al., 2015). Physical immersion remains distinctive and, in many cases, more transformative at the personal level. Still, TNE expands access to internationalised curricula and pedagogical diversity for students constrained by cost, visa regimes, family responsibilities, or other barriers to mobility.

For this reason, TNE and student mobility should not be treated as competing models. They support different forms of international learning. Mobility often provides deeper experiential transformation through immersion in another academic and social environment. TNE, by contrast, enables more distributed and scalable forms of knowledge circulation. In both the EHEA and the United States, it diversifies how know-how moves across borders.

6. Geopolitics and the Reconfiguration of Know-How Circulation (China and India)

Mobility systems do not operate independently of geopolitics. When political conditions shift, immediate discussion often centers on enrolment volatility, visa processing, or recruitment risk. Yet the more analytically important issue is how such changes reshape the pathways through which know-how circulates across higher education and research systems. Mobility disruption is therefore not only a question of who moves, but also of how research networks, doctoral pipelines, professional trajectories, and institutional partnerships are sustained, redirected, or weakened over time (Marginson, 2022).

International education functions as a long-term infrastructure for knowledge circulation. Students, doctoral researchers, and collaborative programmes create channels through which research methods, disciplinary approaches, tacit academic practices, and professional competences move across borders. When policy environments become less predictable, the effects rarely remain limited to individual students. They can extend to research collaboration, laboratory continuity, supervision structures, and partnership planning. This is especially significant in relation to major sending countries, because large mobility corridors shape the density and direction of global academic networks (IIE, 2025; Knight, 2013).

The China-US corridor illustrates how geopolitical friction can alter knowledge circulation without necessarily producing a simple collapse of exchange. Recent policy developments in the United States indicate heightened scrutiny for some Chinese students, especially in relation to sensitive fields and selected affiliations (U.S. Department of State, 2025). From a know-how perspective, the crucial issue is not only the policy itself, but also the uncertainty it creates. Even targeted restrictions can influence educational decision-making more broadly by increasing perceived risk among prospective students, families, and partner institutions.The India-US corridor currently presents a different pattern. Recent mobility data show India as the leading country of origin for international students in the United States, while China remains the second largest source country (IIE, 2025). The scale of Indian student mobility matters because it amplifies network effects. High-volume mobility tends to produce stronger alumni networks, more durable research links, and broader talent pipelines, especially where degree mobility intersects with graduate education, research training, and work-related learning.

At the same time, scale creates sensitivity. In highly interconnected mobility systems, even relatively modest visa delays, administrative uncertainty, or changes in public signaling can redistribute flows over time. This should not automatically be read as a crisis narrative. It is also a normal feature of a competitive and politically exposed global education environment.

From a comparative perspective, the EHEA offers a somewhat different configuration. Bologna structures, recognition tools, and Erasmus+ support a diversified set of pathways for knowledge circulation, including credit mobility, joint degrees, and blended formats. These mechanisms can make it easier to stabilize exchange through programme-based cooperation even when some global mobility corridors become less predictable (EHEA, 2024; European Commission, 2025).The key analytical point is that geopolitical shifts rarely stop know-how circulation altogether. More often, they reconfigure it. They change which corridors are dense, which institutions become more central, which disciplines remain open, and which alternative modes, such as joint provision, blended mobility, or TNE, become more attractive.

7. Comparative Synthesis: Patterns of Know-How Circulation Across the EHEA and the United States

Reframing mobility, joint degrees, and TNE around know-how makes comparison between the EHEA and the United States more analytically useful. The key difference is not simply that the two systems host different volumes or directions of mobility. Rather, they tend to generate

different patterns of knowledge exposure, different forms of tacit learning, and different ways in which know-how becomes durable and transferable over time (Teichler, 2017).

A useful way to synthesize this comparison is to distinguish between two broad logics of knowledge circulation: portability and immersion. In the EHEA, know-how circulation is often structured around academic portability. Mobility is frequently designed to be credit-bearing, recognizable, and continuous within the home degree pathway, supported by shared frameworks and common reference tools established through the Bologna Process (European Commission, EACEA, & Eurydice, 2024).

In the United States, by contrast, know-how circulation is more often shaped by institutional immersion. International students are predominantly degree-seeking and typically spend longer periods within a single institutional environment. This can deepen socialization into local research cultures, disciplinary communities, campus routines, and field-specific professional networks (Altbach & de Wit, 2021). Neither logic is inherently superior. They support different forms of knowledge acquisition and consolidation.

This distinction becomes especially important when considering the movement of explicit and tacit knowledge. Explicit knowledge can travel relatively easily through curriculum design, course content, learning outcomes, and assessment structures. Tacit knowledge, however, depends more heavily on proximity, repetition, mentorship, informal interaction, and lived participation in academic culture (Polanyi, 1966). From this perspective, EHEA mobility often performs especially well in supporting the structured transfer of formal academic progress, while US degree mobility may offer stronger conditions for deeper tacit knowledge formation through longer immersion and more sustained network-building (Teichler, 2017; Altbach & de Wit, 2021).Joint programme degrees occupy a particularly important position in this comparison because they intensify knowledge integration. They require institutions to co-design curricula, coordinate supervision, align standards, and negotiate pedagogical practices. For that reason, joint degrees are better understood as mechanisms for the co-production of know-how rather than simple transfer (Knight, 2013).Transnational education extends the comparison further by showing that internationalisation no longer depends exclusively on physical mobility. Through offshore provision, digital delivery, branch campuses, and partnership-based teaching, TNE enables programme structures, curricula, and pedagogical models to move across borders even when students do not (Knight, 2013; de Wit et al., 2015). In the EHEA, TNE can align with broader goals of compatibility, recognition, and blended international learning. In the United States, it more often reflects institutional strategies of global reach and offshore expansion (Altbach & de Wit, 2021).

External conditions, however, can reshape these patterns. Geopolitical tensions, visa restrictions, and security concerns rarely stop knowledge circulation altogether. More often, they reroute it. Changes affecting major mobility corridors influence where tacit networks are concentrated, where research collaboration remains stable, and where institutional partnerships become more durable over time (Marginson, 2022).

The overall comparative pattern can therefore be stated in three propositions. First, the EHEA tends to support know-how circulation through portability and interoperability, enabling repeated and academically continuous exchanges across multiple contexts. Second, the United States tends to support know-how circulation through longer-term degree mobility and institutional immersion, which can deepen tacit learning and embedded network formation within a single academic ecosystem. Third, joint degrees and TNE act as amplifiers in both contexts because they move curricula, pedagogy, and institutional routines as well as students, producing not only transfer but also hybridisation and co-created know-how. These comparative patterns are synthesized in Table 2.

Table 2. Comparative Patterns of Know-How Circulation in the EHEA and the United States

Analytical lens	EHEA typical pattern	US typical pattern	Know-how implication
Dominant mobility form	more credit mobility within degree pathways	more degree mobility and longer stays	portability and immersion shape different forms of tacit learning
Learning continuity	structurally supported recognition and progression	recognition varies by institution and pathway	continuity supports coherent knowledge accumulation
Tacit knowledge formation	repeated adaptation across multiple contexts	deep immersion in one institutional culture	breadth of adaptive cycles versus depth of embedded networks
Joint programme dynamics	supported by interoperability tools	supported by institutional autonomy and partnerships	co-produced curricula emerge through different coordination logics
TNE emphasis	often linked to compatibility and blended formats	often driven by institutional global reach	knowledge distribution scales through different institutional models
Resilience of knowledge corridors	multiple pathways within a shared regional space	corridor stability more dependent on national entry conditions	rerouting affects where networks concentrate over time

8. Implications for Higher Education Systems: Designing for Know-How Circulation

Reframing mobility, joint degrees, and transnational education around know-how changes the terms of policy and institutional debate. The central question is no longer simply how to increase participation rates or expand international recruitment. It becomes how higher education systems can strengthen the durability, transferability, and diffusion of the knowledge generated through internationalization (Knight, 2013). This shift matters because counting movement alone does not capture whether mobility produces meaningful academic, professional, or institutional learning.

A first implication concerns the design of mobility itself. If the most lasting benefits of international experience lie in transversal competences, epistemic flexibility, and tacit learning, then mobility should be structured to support those outcomes more explicitly rather than assuming they will arise automatically (OECD, 2023). This requires closer alignment between international experiences and curriculum design, clearer integration with competence frameworks, and greater use of reflective learning processes that help students recognize and articulate what they have gained.

A second implication concerns recognition and continuity. Academic know-how circulates most effectively when learning can be carried across contexts without fragmentation. Within the EHEA, instruments such as ECTS, qualifications frameworks, and learning outcomes-based design help preserve continuity by making study periods abroad legible and transferable within home degree pathways (European Commission, EACEA, & Eurydice, 2024). In more decentralized environments, where recognition is negotiated at institutional level, coherence often depends on articulation agreements, carefully designed pathways, and active advising structures (Altbach & de Wit, 2021).

A third implication is that internationalization should be understood as a form of organizational learning. Joint degrees and TNE make this particularly visible because they require institutions to exchange pedagogical practices, quality assurance approaches, governance routines, and

models of academic support. When programmes are co-designed or delivered across borders, institutions themselves become learners. Systems that treat cross-border collaboration as an opportunity for institutional learning are more likely to generate durable benefits than those that approach it only as a source of enrolment or prestige.

A fourth implication concerns resilience. Geopolitical shifts, visa restrictions, and security-related uncertainty can disrupt established mobility corridors and make international partnerships less predictable. From a know-how perspective, higher education systems need diversified and flexible channels of circulation rather than excessive dependence on a small number of routes or source countries (Marginson, 2022). Blended mobility, digital collaboration, joint supervision, and TNE can all help maintain longer-term knowledge exchange when physical mobility becomes more constrained.

A fifth implication concerns evaluation. Mobility policies have often relied on numerical indicators such as participation rates, destinations, or duration abroad. While these remain useful, they reveal little about what students actually learn or how that learning shapes later academic and professional trajectories. A more analytically robust approach would include evidence related to competence development, research integration, epistemic growth, and longer-term institutional learning.

Possible ways of evaluating these outcomes are outlined in Table 3.

Table 3. Knowledge Outcomes and Possible Evidence Sources

Outcome category	Examples of outcomes	Possible evidence sources
Epistemic and cognitive	shifts in critical reasoning, interdisciplinarity, epistemic flexibility	reflective portfolios, capstone work, pre- and post-mobility self-assessment, supervisor evaluation
Pedagogical adaptation	new study strategies, participation norms, assessment literacy	learning diaries, course performance patterns, qualitative interviews
Research competence	methodological proficiency, laboratory or data practices	thesis quality indicators, co-authorship, lab records, supervisor reports
Professional competence	teamwork, communication, problem-solving, sector orientation	internship feedback, employer surveys, competency rubrics
Network and social capital	durable academic or professional ties	alumni tracking, collaboration mapping, mentoring participation
Institutional learning	new quality assurance routines, curriculum redesign, student support improvement	programme reviews, QA reports, policy updates, partner feedback

Taken together, these implications suggest a broader reorientation of policy and institutional strategy. Mobility should be designed for learning rather than treated as an end in itself. Recognition mechanisms should be valued as tools of intellectual continuity rather than mere administrative devices. Joint degrees and TNE should be seen as platforms for co-produced institutional knowledge, not simply as international branding exercises. Once know-how is placed at the centre of analysis, the relevant measure of success is not simply how many students cross borders, but how effectively systems support the creation, integration, and diffusion of knowledge across borders.

9. Policy and Institutional Recommendations: From Mobility Targets to Knowledge Strategies

If mobility, joint degrees, and transnational education are understood as mechanisms of know-how circulation, then policy and institutional strategy should move beyond simple expansion targets and focus more directly on the conditions under which knowledge is generated, transferred, retained, and diffused. Several implications follow from this perspective.

First, mobility should be designed more deliberately for learning outcomes that include tacit and transversal competences as well as formal academic achievement. International experience should not be assumed to produce reflection, adaptability, or intercultural capability automatically. Institutions should therefore integrate mobility more explicitly into programme design through reflective assignments, competence mapping, supervised reintegration, and stronger links between mobility and curriculum goals.

Second, recognition systems should be treated as instruments of intellectual continuity rather than merely administrative procedures. In the EHEA, Bologna tools such as ECTS, qualifications frameworks, and diploma supplements already provide an important infrastructure for this purpose (European Commission, EACEA, & Eurydice, 2024). In more decentralized settings such as the United States, stronger articulation agreements, pathway design, and academic advising are needed to reduce fragmentation and preserve coherent learning progression.

Third, joint degrees and TNE should be supported as platforms for institutional learning, not only as vehicles for visibility or recruitment. Because these arrangements require co-designed curricula, shared quality assurance, and negotiated pedagogical practices, they also generate institutional know-how. Policy frameworks and funding schemes should therefore reward not only participation, but also evidence of curriculum innovation, organizational learning, and sustainable partnership development.

Fourth, higher education systems should diversify the channels through which know-how circulates. Overdependence on a small number of mobility corridors or source countries increases vulnerability to geopolitical shocks, visa uncertainty, and regulatory disruption. Blended mobility, joint supervision, digitally supported collaboration, and carefully designed TNE provision can help preserve continuity when physical movement becomes less predictable.

Fifth, evaluation frameworks should include qualitative and longitudinal evidence of learning and institutional impact. Numerical indicators such as participation rates or duration abroad remain useful, but they are insufficient on their own. More robust evaluation should also consider epistemic development, research competence, employability-related learning, alumni networks, and the extent to which institutions adapt their own practices through international collaboration.

Taken together, these recommendations suggest that the central policy question is not simply how to increase cross-border activity, but how to strengthen the quality, resilience, and long-term effects of know-how circulation across higher education systems.

10. Conclusion

Student mobility, joint degrees, and transnational education are often discussed through the language of flows, recruitment, and regulation. These dimensions matter, but they do not fully explain why internationalization remains so consequential for higher education. This article has argued that their deeper significance lies in the circulation, transformation, and hybridization of know-how. What moves across borders is not only students, but also epistemic frameworks, pedagogical practices, research methods, institutional routines, and professional competences (Knight, 2013; de Wit et al., 2015).

Seen from this perspective, mobility is more than physical movement. It is a mechanism through which students encounter new academic cultures, reinterpret prior knowledge, and acquire both explicit and tacit forms of learning. As Teichler (2017) suggests, the value of mobility cannot be reduced to participation rates or destinations alone. Its longer-term effects often lie in epistemic flexibility, adaptive capacity, and the ability to navigate diverse academic and professional environments. Tacit knowledge, in particular, remains central. Confidence, methodological intuition, intercultural fluency, and the capacity to work across institutional differences are rarely captured by formal metrics, yet they are among the most durable outcomes of international experience (Polanyi, 1966; Marginson, 2022).

The comparison between the European Higher Education Area (EHEA) and the United States shows that different systemic arrangements support different patterns of know-how circulation. The EHEA, shaped by Bologna instruments, Erasmus+, and shared recognition tools, tends to organize mobility around interoperability, portability, and structured academic continuity (European Commission, EACEA, & Eurydice, 2024; European Commission, 2025). The United States, by contrast, more often supports know-how circulation through degree mobility, longer-term institutional immersion, and deeper embedding in local research and campus environments (Altbach & de Wit, 2021). These are not competing models in any simple sense. They represent different ways of organizing the relationship between mobility and learning.

Joint programme degrees and transnational education extend this argument further. Joint degrees intensify know-how circulation by requiring institutions to co-design curricula, align standards, and integrate pedagogical practices, thereby producing not only exchange but co-created academic knowledge (Knight, 2013). Transnational education broadens the field further by enabling curriculum models, teaching practices, and institutional routines to travel even when students do not. Together, these modalities show that internationalization increasingly depends on the mobility of knowledge, practices, and learning environments as much as on the mobility of people.

Geopolitical change adds another layer to this picture. As recent developments around major mobility corridors demonstrate, external pressures rarely end knowledge circulation altogether. More often, they reroute it. They alter where networks deepen, where institutional collaboration becomes more durable, and which forms of mobility or transnational provision become more attractive (Marginson, 2022). In this environment, the long-term value of internationalization depends less on sheer movement and more on the capacity of systems to preserve continuity, sustain tacit and explicit learning, and adapt pathways when specific corridors become less stable.

The article's main contribution has been to propose know-how circulation as a comparative analytical lens for understanding internationalization across differently organized higher education systems. Ultimately, mobility moves people, but its most enduring legacy lies elsewhere. It lies in the ways knowledge is translated, reassembled, and diffused across borders. If internationalization is understood in these terms, then the relevant question for higher education is not only how many students move, but how effectively institutions and systems enable know-how to circulate, endure, and generate new forms of learning across an increasingly uncertain global landscape.

Integrating Digital Transformation and Industry Collaboration in Architectural Education: Advancing Green Innovation and Sustainable Learning

Ardit Lila, Ph.D.

University of New York Tirana, Albania
arditlila@unyt.edu.al
ORCID: 0009-0002-9111-8890

Abstract

This study examined the role of academia - industry partnerships in architectural education within the context of digital transformation and the transition toward a green economy. The research addressed the question of how the integration of industry collaboration, innovative materials, and digitally informed design approaches can bridge the gap between theoretical learning and professional practice. A qualitative methodology was adopted, based on a case study of a workshop developed in collaboration with the wood-processing industry, where students engaged in the reuse of surplus and discarded materials through design experimentation.

The findings indicated that experiential learning, combined with site visits and exposure to real production processes, significantly improved students' understanding of sustainable construction techniques, material innovation, and technological advancement. The application of digital tools in the design process further supported critical thinking related to resource efficiency and environmental impact. Results also highlighted the importance of the lecturer's dual role as educator and mediator between academia and industry in enhancing student engagement and knowledge transfer.

The study concluded that structured collaboration with industry, supported by digital transformation and innovation-driven pedagogies, is essential for advancing green education in architecture. It is recommended that such approaches be systematically integrated into curricula through workshops, internships, and applied learning models.

Keywords*: green education; digital transformation; academia–industry collaboration; sustainable architecture; circular economy*

1. Introduction

The transition toward digital transformation in higher education has intensified demands for pedagogies that link conceptual knowledge with professional application. In architecture, where students must understand materials, construction logic, spatial organization, and implementation procedures, the distance between theory and practice can easily weaken learning outcomes if instruction remains confined to abstract representation. (Bates, 2019; OECD, 2021) (Schön, 1983; Biggs & Tang, 2011)

This paper examines a workshop-based educational model developed through collaboration between academia and the wood-processing industry. It responds to the conference focus on digital transformation by showing how digitally informed design, when combined with industrial engagement and experiential learning, can strengthen sustainability-oriented architectural education. The study identifies the central question of how industry collaboration, innovative materials, and digital design approaches can bridge theoretical learning and professional practice. (Biggs & Tang, 2011; Schön, 1983)

The present manuscript offers a more developed academic discussion of the pedagogical value of site visits, material reuse, and full-scale making. The case is particularly relevant for design studios and implementation-oriented courses, where students need not only conceptually understanding but also exposure to real production processes, construction constraints, and environmental considerations. The underlying premise is that learning becomes deeper when students observe, test, and transform materials rather than only describing them.

The paper also relates this model to broader debates about educational innovation and artificial intelligence. While digital tools can improve visualization, analysis, and iteration, they should remain instruments of critical inquiry rather than substitutes for intellectual effort. For that reason, the discussion emphasizes the lecturer's dual role as educator and mediator between university and industry, and it argues for the systematic integration of applied learning into curricula through workshops, internships, seminars, and interinstitutional cooperation. (Redecker, 2017; Holmes et al., 2019) (Luckin et al., 2016; UNESCO, 2021) (Biggs & Tang, 2011) (Selwyn, 2016) (Bates, 2019).

2. Body of Manuscript

The manuscript adopts a qualitative case-study approach focused on a pedagogical workshop organized with third-year architecture students. The workshop was designed to connect design education with the material realities of production, reuse, and construction. Rather than treating the studio as a closed academic space, the exercise moved students toward a learning environment in which observations from industry and hands-on fabrication became integral to design development.

The collaboration with a wood-processing and manufacturing company made it possible to introduce surplus and discarded timber elements into the educational process. These materials, initially considered waste, were repositioned as pedagogical resources for experimentation in sustainable and circular design. Students visited the production site, observed the preparation and transformation of material, and discussed how waste streams can be redirected into productive architectural use. This experience made abstract notions such as efficiency, reuse, and circularity concrete and operational. (OECD, 2021).

After the site visit, students developed a small pavilion in the open space in front of the university. The pavilion functioned as a modest but meaningful architectural artifact intended for exhibitions, project presentations, and academic activities. Its construction required the students to consider structure, joints, dimensions, assembly sequence, and usability. In this sense, the project operated as a bridge between design intent and implementation logic, forcing students to translate drawings and conceptual ideas into a real built object.

The educational contribution of the workshop is significant because implementation-based courses often expose a gap between graphic representation and construction knowledge. Students frequently struggle to understand how material properties, detailing, and execution affect architectural outcomes. By handling actual wood elements and resolving practical problems during construction, the participants improved their comprehension of tolerances, spatial coordination, and structural reasoning. The workshop therefore functioned as a form of learning by making, in which knowledge was produced through action, reflection, and adjustment. (Schön, 1983).

Digital tools were present in the process, but their role was carefully bounded. Instead of replacing physical engagement, digitally informed design supported analysis, visualization, iterative refinement, and evaluation of material efficiency. Students could compare alternatives, test proportions, and anticipate assembly challenges more effectively. This is important because digital transformation in education is most productive when it enhances judgment and expands

analytical capacity, not when it removes the need for direct observation or manual verification. (Redecker, 2017; Holmes et al., 2019).

The lecturer played a central role in shaping this process. The teacher was not only a transmitter of technical information but also a connector between academic expectations and industrial realities. Such mediation is essential in educational contexts where students need help interpreting professional practice. The workshop demonstrated that pedagogical leadership could create a learning environment in which industry collaboration becomes structured, meaningful, and intellectually demanding rather than merely symbolic. (Biggs & Tang, 2011; Schön, 1983).

The case also reveals the importance of experiential learning in sustainability education. Reuse of discarded timber, exposure to production workflows, and construction of a functional pavilion collectively helped students understand the environmental implications of design decisions. The project showed that sustainability is best taught not only as an ethical concept but also as an operational practice embedded in material choice, fabrication strategy, and lifecycle awareness. (Schön, 1983) (UNESCO, 2021)

In broader curricular terms, the findings support the integration of workshops, site-based learning, and industry agreements into architectural education. Such arrangements help students prepare for the labour market by improving adaptability, technical literacy, and awareness of construction processes. They also create conditions for closer collaboration among universities, firms, and other institutions, which is especially valuable in fields where professional competence depends on interaction with the built environment and with real production systems.

This model is consistent with the goals of the conference, which emphasizes digital transformation, innovation, and applied perspectives. The case suggests that future-ready education should not treat digitalization as a purely technological agenda. Rather, it should combine digital competence with tangible making, environmental responsibility, and collaborative problem-solving. In that sense, the workshop provides evidence that the quality of learning increases when theory, practice, and industrial exposure are intentionally aligned. (Redecker, 2017)

Table 1 summarizes the main components of the case study and the corresponding pedagogical outcomes. The table is included to present the analytical structure of the workshop in a clear and concise form, in line with the journal's guidance on the use of tables and figures.

3. Tables, Figures and Equations

Table 1. Educational structure of the workshop case study.

Workshop component	Pedagogical function	Learning outcome
Site visit to wood-processing firm	Exposure to real production processes and material flow	Improved understanding of industrial practice
Reuse of surplus timber	Reframing waste as educational and design resource	Stronger awareness of circular economy
Pavilion construction	Translation of design ideas into built form	Better grasp of detailing and execution
Digital design support	Visualization and iterative testing	Enhanced analysis and resource efficiency
Lecturer mediation	Connection between academia and industry	More structured knowledge transfer

Equation (1) summarizes the pedagogical logic of the workshop:

Learning Effectiveness = Theory + Practice + Industry Collaboration + Digital Support + Reflection **(1)**

Fig. 1. Leftover materials collected from the storage facilities of the wood-processing company Arnold, later reused for the construction of the wooden pavilion.
Source: Author's photographs.

Fig. 2. Moments from the workshop organized at University of New York Tirana in collaboration with Lemont, showing students and faculty members during the construction of the wooden pavilion.
Source: Author's photographs.

The visual evidence in this section strengthens the methodological narrative of the workshop by documenting the transformation of reclaimed timber into an educational and architectural resource. Figure 1 shows the leftover materials collected from the storage facilities of the wood-processing company Arnold and later reused for the construction of the wooden pavilion. This image illustrates the pedagogical and environmental relevance of material reuse, demonstrating

how industrial remnants can be reframed as productive inputs for experiential learning and sustainable design practice. (Schön, 1983)

Figure 2 captures the collaborative dimension of the workshop at the University of New York Tirana in partnership with Lemont, showing students and faculty members during the construction of the pavilion. The photograph highlights the value of teamwork, academic supervision, and learning-by-doing within a real design-build environment, where theoretical knowledge is translated into physical form through active participation. Together, the two images provide a coherent visual record of the workshop as an integrated educational process that connects material awareness, sustainability, and applied architectural learning.

4. Conclusions

The study demonstrates that the gap between theoretical learning and professional practice in architectural education can be reduced through structured collaboration between academia and industry. The workshop showed that site visits, material reuse, and full-scale construction helped students understand implementation design, sustainable construction, and the practical consequences of material choice. (Biggs & Tang, 2011; Schön, 1983)

The findings also indicate that digital tools are most effective when they complement, rather than replace, experiential learning. In architecture and related design fields, educational quality improves when digital transformation is integrated with physical making, collaborative work, and exposure to real production processes. This balance is particularly important in courses where students must develop both conceptual insight and technical competence. (Schön, 1983) (Redecker, 2017; Holmes et al., 2019)

A further conclusion concerns the role of the lecturer as mediator. When academic staff actively connect theory, industry, and sustainability, students engage more deeply, and knowledge transfer becomes more durable. Universities should therefore support applied teaching models through curriculum design, institutional partnerships, and regular cooperation with firms and professional actors. (Zawacki-Richter et al., 2019)

In practical terms, the paper recommends systematic use of workshops, internships, site visits, and industry agreements in architecture curricula. These measures can strengthen students' readiness for professional practice, reinforce circular and green design thinking, and contribute to a more robust model of digital-era education grounded in human creativity and critical judgment. (Biggs & Tang, 2011; Schön, 1983)

Abstract

Small and medium-sized enterprises (SMEs) in small transition economies operate under conditions of institutional volatility, labor market rigidities, and constrained access to strategic resources. Within such structurally fragile environments, sustainable competitiveness increasingly depends on intangible assets—particularly strategic human resource management (SHRM) practices capable of generating adaptive capacity. Building on the resource-based view (Barney, 1991) and dynamic capabilities theory (Teece, 2007), contemporary research argues that human capital configurations and HR systems function as higher-order capabilities that enable firms to sense environmental shifts, seize emerging opportunities, and reconfigure internal resources under uncertainty (Jiang & Messersmith, 2018; Teece, 2018; Farndale et al., 2022). This paper conceptualizes SHRM as a dynamic capability that enhances SME competitiveness in small transition economies, with empirical focus on Western Balkan markets. Integrating insights from strategic HRM scholarship (Delery & Roumpi, 2017; Kaufman, 2020) and recent studies on SMEs in emerging contexts (Brix, 2021; OECD, 2023), the analysis examines how structured HR practices—training intensity, performance-based compensation, talent retention mechanisms, and participatory leadership—translate into measurable firm-level outcomes. The findings indicate that SMEs implementing coherent SHRM systems exhibit significantly higher productivity growth, stronger employee retention, and improved market responsiveness compared to firms relying on informal or ad hoc HR practices. Evidence further suggests that strategic flexibility mediates the link between HR practices and competitive performance, confirming that SHRM operates not merely as an administrative function but as an adaptive capability embedded in managerial decision-making processes. By empirically linking SHRM to dynamic capabilities within structurally constrained markets, this study advances the literature on SME competitiveness beyond capital- and technology-centered explanations. The results provide policy-relevant implications for strengthening managerial competencies, reducing skill mismatches, and enhancing institutional support mechanisms to foster sustainable competitive upgrading in Western Balkan transition economies.

Key words:*Strategic Human Resource Management; Dynamic Capabilities; SMEs; Competitiveness; Small Transition Economies; Western Balkans.*

1. Introduction

Small and medium-sized enterprises (SMEs) constitute the backbone of most contemporary economies, accounting for the majority of business entities, employment generation, and value creation. Their importance is particularly pronounced in small transition economies, where economic growth, labor market development, and regional competitiveness depend heavily on the performance and adaptability of SMEs (OECD, 2023). In the Western Balkans, SMEs operate within environments characterized by institutional instability, regulatory uncertainty, limited access to finance, labor market constraints, and increasing exposure to global competitive

pressures. Under such conditions, traditional sources of competitive advantage based on physical assets and financial resources have become increasingly insufficient for ensuring long-term organizational success.

The growing importance of intangible assets has redirected scholarly attention toward human capital and the strategic management of people as critical drivers of organizational performance. According to the Resource-Based View (RBV), firms achieve sustainable competitive advantage when they possess valuable, rare, inimitable, and non-substitutable resources that competitors cannot easily replicate (Barney, 1991). Among such resources, human capital represents one of the most strategically significant assets because of its potential to generate innovation, organizational learning, and knowledge-based advantages. Consequently, Strategic Human Resource Management (SHRM) has evolved from a predominantly administrative function into a central component of organizational strategy aimed at aligning human resource practices with broader business objectives (Delery & Roumpi, 2017).

However, the increasingly dynamic nature of business environments suggests that competitive advantage depends not only on possessing valuable resources but also on the ability to continuously adapt and renew them. This perspective is reflected in Dynamic Capabilities Theory, which argues that firms must develop the capacity to sense environmental changes, seize emerging opportunities, and reconfigure internal resources to maintain competitiveness in rapidly changing markets (Teece, 2007; Teece, 2018). Within this framework, human resource systems can be understood as strategic mechanisms that facilitate organizational adaptation, flexibility, and renewal. Recent research increasingly recognizes SHRM as a higher-order organizational capability capable of supporting dynamic capability development through employee skills enhancement, knowledge integration, leadership development, and organizational learning processes (Jiang & Messersmith, 2018).

The relevance of this perspective is particularly evident in SMEs operating in transition economies. Unlike large corporations, SMEs frequently face resource scarcity, informal organizational structures, and limited managerial specialization. Nevertheless, their relatively flexible structures can provide opportunities for rapid adaptation and innovation when supported by effective human resource practices. Studies suggest that structured investments in employee development, performance-based reward systems, talent retention initiatives, and participatory leadership practices contribute significantly to organizational resilience and competitiveness (Farndale et al., 2022; Kaufman, 2020). Yet empirical evidence examining these relationships within the context of small transition economies remains relatively limited, particularly in the Western Balkans.

This paper addresses this gap by conceptualizing Strategic Human Resource Management as a dynamic capability that enhances SME competitiveness in small transition economies. Specifically, the study investigates how strategic HR practices contribute to firm-level outcomes such as productivity growth, employee retention, and market responsiveness, while examining the mediating role of strategic flexibility. By integrating insights from the Resource-Based View, Dynamic Capabilities Theory, and Strategic Human Resource Management literature, the study seeks to provide a more comprehensive understanding of the mechanisms through which SMEs can build sustainable competitive advantage in environments characterized by uncertainty and institutional constraints.

The paper contributes to the literature in three important ways. First, it extends existing SHRM research by positioning strategic human resource management as a dynamic capability rather than merely a support function. Second, it enriches the dynamic capabilities literature by identifying human resource systems as critical enablers of organizational adaptation and strategic renewal. Third, it contributes to the growing body of research on SME competitiveness in transition economies by providing a conceptual framework that links strategic human

resource practices, strategic flexibility, and competitive performance within the Western Balkan context.

2. Literature review

2.1. Strategic Human Resource Management: Theoretical Foundations

Strategic Human Resource Management (SHRM) has evolved into one of the most influential perspectives in contemporary management research, reflecting the recognition that human resources constitute a critical source of organizational performance and competitive advantage. Unlike traditional personnel management, which focuses primarily on administrative functions such as staffing, compensation administration, and compliance, SHRM emphasizes the strategic alignment of human resource practices with organizational goals and long-term business strategy (Wright & McMahan, 1992).

The emergence of SHRM was closely associated with the growing integration of human resource management and strategic management during the late twentieth century. Early contributions by Beer et al. (1984) and Schuler and Jackson (1987) argued that organizations could no longer view employees merely as operational inputs but rather as strategic assets capable of contributing to organizational effectiveness and sustainable success. This perspective introduced the importance of aligning HR practices with organizational objectives and competitive strategy.

A major theoretical foundation of SHRM is the Resource-Based View (RBV) of the firm. According to Barney (1991), sustainable competitive advantage originates from resources that are valuable, rare, imperfectly imitable, and non-substitutable. Human resources often meet these criteria because employees possess tacit knowledge, experience, competencies, and social relationships that are difficult for competitors to replicate. Consequently, firms that effectively attract, develop, motivate, and retain talented employees are more likely to achieve superior performance and long-term competitiveness. The strategic role of human capital is further supported by Human Capital Theory, which argues that investments in education, training, and skill development increase employee productivity and organizational value creation (Becker, 1964). Within the SHRM framework, employee development initiatives are viewed not as costs but as strategic investments that strengthen organizational capabilities and improve firm performance.

Building upon these theoretical foundations, SHRM research has increasingly focused on systems of integrated human resource practices. Huselid (1995) demonstrated that firms implementing High-Performance Work Systems (HPWS)—including selective staffing, extensive training, performance-based compensation, and employee participation—achieved significantly higher levels of productivity and financial performance. Similarly, Delery and Doty (1996) emphasized that organizational performance depends not only on individual HR practices but also on the degree of internal consistency among HR policies and their alignment with organizational strategy.

Contemporary SHRM scholarship continues to emphasize that the strategic value of human resources derives from their contribution to organizational capabilities. Delery and Roumpi (2017) argue that human capital should be understood as a strategic asset capable of generating sustained competitive advantage when supported by coherent HR systems. In increasingly complex and uncertain business environments, organizations require HR practices that not only improve operational efficiency but also foster learning, innovation, adaptability, and organizational resilience.

For SMEs operating in transition economies, these considerations become particularly important. Resource constraints often limit their ability to compete through economies of scale, advanced technologies, or financial strength. Consequently, effective human resource management may represent one of the few sustainable mechanisms through which SMEs can differentiate themselves and improve competitiveness. Strategic investments in employee development, knowledge sharing, leadership support, and talent retention therefore become critical factors influencing organizational success in uncertain and rapidly changing environments.

Table 1. Key Theoretical Foundations of Strategic Human Resource Management

Theory / Perspective	Main Author(s)	Core Argument	Relevance to SHRM
Human Capital Theory	Becker (1964)	Investment in education and skills increases productivity and economic value.	Supports the strategic importance of employee development and training.
Resource-Based View (RBV)	Barney (1991)	Competitive advantage derives from valuable, rare, inimitable and non-substitutable resources.	Human capital is considered a strategic resource capable of generating sustained competitive advantage.
Strategic HRM Perspective	Wright & McMahan (1992)	HR practices must be aligned with organizational strategy to improve performance.	Establishes the conceptual foundation of SHRM.
High-Performance Work Systems (HPWS)	Huselid (1995)	Bundles of HR practices enhance productivity and financial performance.	Demonstrates the performance impact of integrated HR systems.
Configurational Approach	Delery & Doty (1996)	HR practices create value when they are internally consistent and strategically aligned.	Emphasizes vertical and horizontal fit in SHRM.
Human Capital and Competitive Advantage	Delery & Roumpi (2017)	Human capital becomes a source of sustained competitive advantage when strategically managed.	Links SHRM directly to organizational competitiveness.

Table 1 synthesizes the principal theoretical perspectives underpinning Strategic Human Resource Management. Collectively, these approaches demonstrate a gradual evolution from viewing employees as operational resources toward recognizing human capital as a strategic asset capable of generating sustainable competitive advantage. While Human Capital Theory highlights the economic value of investments in employee skills and knowledge, the Resource-Based View explains why such resources can become sources of competitive differentiation. Strategic HRM and High-Performance Work Systems further emphasize that organizational performance depends not only on the quality of individual employees but also on the effectiveness of integrated HR systems aligned with organizational objectives. These theoretical foundations provide the basis for understanding how human resource management contributes to organizational capabilities and competitiveness.

2.2. SHRM, Strategic Flexibility and SME Competitiveness

The competitiveness of small and medium-sized enterprises (SMEs) increasingly depends on their ability to adapt to rapidly changing economic and market conditions. In transition economies, where firms frequently face institutional uncertainty, labor market constraints, and limited access to strategic resources, adaptability becomes a critical determinant of long-term success. Consequently, attention has shifted from traditional sources of competitive advantage toward organizational capabilities that enable firms to respond effectively to environmental changes.

Strategic Human Resource Management (SHRM) has emerged as a key organizational mechanism through which firms develop such adaptive capabilities. Unlike traditional human resource management, SHRM emphasizes the strategic alignment of people-management practices with organizational objectives and competitive priorities (Wright & McMahan, 1992). Through investments in employee development, performance management, talent retention, and participatory leadership, firms can strengthen their capacity to learn, innovate, and adapt to changing business environments. The dynamic capabilities perspective provides a useful framework for understanding this relationship. According to Teece, Pisano, and Shuen (1997), competitive advantage depends not only on the possession of valuable resources but also on the ability to continuously reconfigure and deploy those resources in response to environmental changes. Since employees represent one of the most valuable organizational resources, human resource systems play a crucial role in enabling adaptation and strategic renewal.

Previous empirical studies have demonstrated positive relationships between strategic HR practices and organizational performance. Huselid (1995) found that firms implementing coherent systems of employee training, performance-based rewards, and employee involvement achieved superior productivity and financial outcomes. Similarly, Delery and Doty (1996) argued that integrated HR systems contribute to firm performance by aligning employee behaviors with strategic objectives. More recent research suggests that strategic HR practices support organizational learning, knowledge sharing, and innovation, all of which are essential for sustaining competitiveness in uncertain environments (Delery & Roumpi, 2017).

One of the key mechanisms linking SHRM and organizational performance is strategic flexibility. Strategic flexibility refers to a firm's ability to adjust its structures, processes, and resource allocations in response to environmental changes and emerging opportunities. Flexible organizations are better positioned to respond to market shifts, adopt new technologies, and overcome unexpected challenges. In SMEs, where formal structures are often less rigid than in larger organizations, strategic flexibility can become a significant source of competitive advantage.

Strategic HR practices contribute directly to the development of strategic flexibility. Training initiatives enhance employee competencies and support organizational learning; performance-based compensation encourages proactive behavior and innovation; talent retention mechanisms preserve organizational knowledge and reduce capability loss; and participatory leadership fosters communication, collaboration, and adaptive decision-making. Collectively, these practices strengthen the firm's capacity to respond effectively to changing conditions and improve competitive performance.

Recent studies have provided additional evidence regarding the importance of strategic flexibility and dynamic capabilities in enhancing SME performance. Research conducted in emerging and transition contexts indicates that strategic flexibility contributes positively to organizational performance, competitive advantage, and long-term sustainability, particularly under conditions of environmental uncertainty (Otache, 2024; Bouhalleb & Ben Amor, 2024). Similarly, studies focusing on SMEs demonstrate that dynamic capabilities strengthen competitive advantage through mediating organizational mechanisms such as digitalization,

innovation, and flexibility (Saputra et al., 2024; Held et al., 2025). These findings reinforce the argument that adaptive organizational capabilities represent a critical pathway through which strategic investments in human resources may contribute to competitiveness.

Despite growing interest in the relationship between SHRM and organizational outcomes, empirical evidence remains limited regarding the mechanisms through which SHRM influences SME competitiveness in transition economies. In particular, relatively few studies have examined the mediating role of strategic flexibility within Western Balkan markets, where institutional volatility and resource constraints create unique managerial challenges. Addressing this gap, the present study investigates whether strategic flexibility serves as the mechanism through which SHRM enhances SME competitiveness in small transition economies.

Table 2. Theoretical Relationships Underpinning the Study

Construct	Theoretical Foundation	Expected Organizational Outcome	Key References
Strategic Human Resource Management (SHRM)	Resource-Based View (RBV); Strategic HRM	Development of human capital, organizational learning and workforce commitment	Barney (1991); Wright & McMahan (1992); Huselid (1995); Delery & Roumpi (2017)

SME Competitiveness	Competitive Advantage and Performance Perspectives	Productivity growth, employee retention and market responsiveness	OECD (2023); Otache (2024)
SHRM → Strategic Flexibility	Dynamic Capability Development	Enhanced adaptive capacity and organizational resilience	Teece (2007); Delery & Roumpi (2017)
Strategic Flexibility → SME Competitiveness	Adaptive Performance Mechanism	Improved competitive positioning and sustainable performance	Otache (2024); Held et al. (2025)
SHRM → Strategic Flexibility → SME Competitiveness	Mediated Relationship	Transformation of human capital investments into competitive outcomes	Bouhalleb & Ben Amor (2024); Saputra et al. (2024)

Table 2 summarizes the theoretical foundations supporting the proposed research model. The framework suggests that Strategic Human Resource Management contributes to competitiveness through the development of organizational capabilities that enhance adaptability and responsiveness. In particular, strategic flexibility is positioned as the key mechanism linking human resource practices to competitive outcomes. Recent evidence indicates that dynamic capabilities and strategic flexibility play an increasingly important role in explaining SME performance, especially in environments characterized by uncertainty and resource constraints (Bouhalleb & Ben Amor, 2024; Otache, 2024). Consequently, the proposed model assumes that strategic HR practices strengthen adaptive capacity, which subsequently translates into higher levels of competitiveness.

3. Conceptual Framework and Research Hypotheses

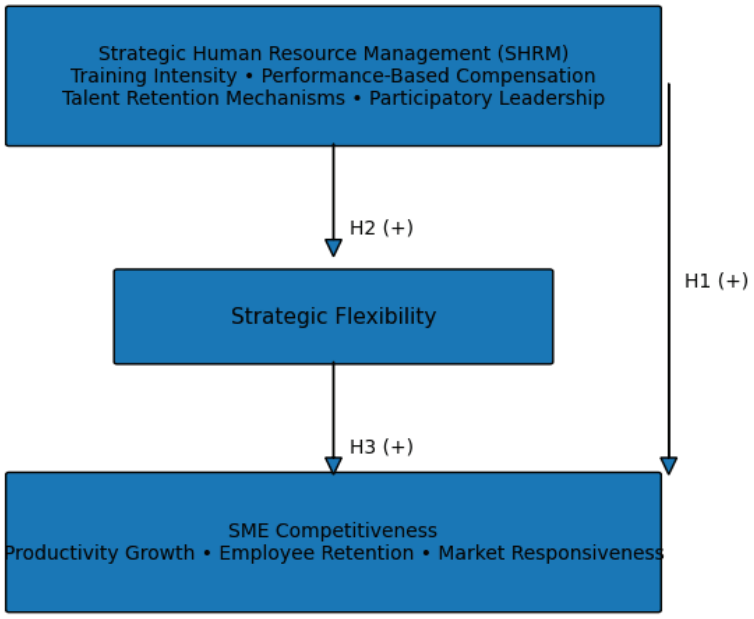
Building upon the theoretical foundations discussed in the previous section, this study proposes a conceptual framework that examines the relationship between Strategic Human Resource Management (SHRM), strategic flexibility, and SME competitiveness in small transition economies. The framework integrates insights from Strategic Human Resource Management literature and Dynamic Capabilities Theory, suggesting that strategic HR practices contribute to organizational competitiveness by enhancing the firm's adaptive capacity.

As illustrated in Figure 1, SHRM is conceptualized as a multidimensional construct composed of four interrelated practices: training intensity, performance-based compensation, talent retention mechanisms, and participatory leadership. These practices collectively represent strategic investments in human capital aimed at improving organizational learning, employee engagement, knowledge retention, and adaptive behavior.

The framework assumes that the influence of SHRM on competitiveness is not exclusively direct. Rather, strategic HR practices contribute to the development of strategic flexibility, defined as the firm's ability to adjust structures, processes, and resource allocations in response to changing environmental conditions. Strategic flexibility enables organizations to react more effectively to market opportunities, technological developments, and competitive pressures, thereby improving overall organizational performance. Within the context of SMEs operating in transition economies, strategic flexibility becomes particularly important due to the high levels of environmental uncertainty, institutional volatility, and resource constraints that characterize these markets. Firms capable of adapting rapidly to changing circumstances are more likely to sustain competitive advantage and achieve superior performance outcomes.

Consequently, the proposed model positions Strategic Human Resource Management as the primary explanatory variable, strategic flexibility as a mediating mechanism, and SME competitiveness as the dependent variable. SME competitiveness is reflected through organizational outcomes such as productivity growth, employee retention, and market responsiveness. The conceptual framework presented in Figure 1 provides the basis for the development of the study's research hypotheses.

Figure 1. Conceptual framework



H4: Strategic Flexibility mediates the relationship between SHRM and SME Competitiveness

The conceptual framework presented in Figure 1 proposes that SHRM contributes to SME competitiveness through both direct and indirect mechanisms. Existing research consistently demonstrates that organizations implementing coherent and strategically aligned HR systems achieve superior organizational outcomes compared to firms relying on fragmented or reactive personnel practices. Investments in employee development, performance-oriented reward systems, talent retention initiatives, and participatory leadership practices strengthen workforce capabilities, improve organizational commitment, and support the achievement of strategic objectives (Huselid, 1995; Delery & Doty, 1996). Within SMEs, where human capital frequently represents the most critical organizational asset, such practices are expected to contribute directly to competitiveness through improved productivity, stronger employee retention, and enhanced responsiveness to market demands. Accordingly, the study proposes that Strategic Human Resource Management positively influences SME competitiveness (H1).

At the same time, the contribution of SHRM extends beyond direct performance effects. Dynamic Capabilities Theory suggests that organizations achieve sustainable competitiveness not simply through the possession of valuable resources but through their ability to continuously adapt those resources to changing environmental conditions (Teece et al., 1997; Teece, 2007). Strategic HR practices play a central role in this process by fostering learning, knowledge sharing, employee engagement, and organizational adaptability. Training activities enhance employees' ability to identify emerging opportunities, performance-based compensation encourages proactive and innovative behavior, talent retention preserves organizational knowledge, while participatory leadership strengthens communication and collaborative decision-making. Collectively, these practices are expected to enhance the organization's capacity to adapt its structures, processes, and resource allocations when facing environmental uncertainty. Therefore, Strategic Human Resource Management is expected to positively influence strategic flexibility (H2).

Strategic flexibility represents a particularly important capability for SMEs operating in transition economies. Firms functioning in environments characterized by institutional volatility, regulatory changes, labor market constraints, and resource limitations must continuously adjust their strategic priorities in order to remain competitive. Organizations capable of reallocating resources, modifying operational processes, and responding rapidly to market developments are generally better positioned to exploit emerging opportunities and withstand competitive pressures. Consequently, higher levels of strategic flexibility are expected to contribute positively to SME competitiveness (H3). Taken together, these arguments suggest that strategic flexibility may represent the principal mechanism through which SHRM translates into competitive outcomes. While strategic HR practices provide the organizational foundation for adaptation, it is the resulting flexibility that enables firms to transform human capital investments into superior performance. In this sense, competitiveness is not generated solely by the existence of HR practices, but by their capacity to strengthen organizational responsiveness and adaptive behavior. Therefore, strategic flexibility is expected to mediate the relationship between Strategic Human Resource Management and SME competitiveness (H4).

Based on these theoretical arguments, the proposed model assumes a direct relationship between SHRM and SME competitiveness, as well as an indirect relationship operating through strategic flexibility. The hypotheses derived from this framework are empirically examined in the following sections.

Table 3. Summary of Proposed Hypotheses

Hypothesis	Proposed Relationship
H1	Strategic Human Resource Management → SME Competitiveness
H2	Strategic Human Resource Management → Strategic Flexibility
H3	Strategic Flexibility → SME Competitiveness
H4	Strategic Flexibility mediates the relationship between Strategic Human Resource Management and SME Competitiveness

Table 3 summarizes the proposed hypotheses derived from the conceptual framework. Together, these hypotheses explain the direct and indirect mechanisms through which Strategic Human Resource Management is expected to influence SME competitiveness through the development of strategic flexibility.

4. Methodology

To examine the proposed relationships among Strategic Human Resource Management (SHRM), strategic flexibility, and SME competitiveness, this study adopts a quantitative research approach grounded in the Resource-Based View (Barney, 1991), Dynamic Capabilities Theory (Teece et al., 1997; Teece, 2007), and Strategic Human Resource Management literature (Wright & McMahan, 1992; Delery & Roumpi, 2017). The study is developed as a proposed empirical model designed to investigate how strategic HR practices contribute to competitiveness in SMEs operating within small transition economies.

The empirical setting focuses on SMEs operating in the Western Balkans, particularly Albania, Kosovo, North Macedonia, and Montenegro. These economies share common characteristics associated with transition environments, including institutional transformation, labor market constraints, limited access to strategic resources, and increasing exposure to regional and international competition. Given these conditions, SMEs provide an appropriate context for examining the role of human resource management in strengthening organizational adaptability and competitive performance. The unit of analysis is the firm, while data are intended to be collected from owners, chief executive officers, HR managers, and senior managers directly involved in strategic and human resource decision-making processes. A sample of approximately 200–300 SMEs is proposed, which is considered sufficient for testing complex relationships among latent constructs through Structural Equation Modeling (SEM).

Data collection is envisaged through a structured questionnaire designed to capture organizational practices and performance perceptions. The questionnaire includes items measuring Strategic Human Resource Management, strategic flexibility, and SME competitiveness. Strategic Human Resource Management is operationalized as a multidimensional construct comprising training intensity, performance-based compensation, talent retention mechanisms, and participatory leadership. These dimensions were selected because they consistently appear in the literature as core strategic HR practices capable of influencing organizational learning, employee engagement, knowledge retention, and adaptive behavior.

Strategic flexibility is conceptualized as the firm's ability to adapt structures, processes, and resource allocations in response to changing environmental conditions and emerging opportunities. In line with Dynamic Capabilities Theory, this construct reflects the organization's capacity to respond effectively to uncertainty and maintain strategic alignment in turbulent environments. SME competitiveness represents the dependent construct and is assessed through indicators related to productivity growth, employee retention, and market responsiveness, which are frequently used as measures of organizational performance in SME research.

All measurement items are proposed to be evaluated using a five-point Likert scale ranging from 1 ("Strongly Disagree") to 5 ("Strongly Agree"). The operationalization of the constructs draws upon established theoretical frameworks and measurement approaches reported in previous studies, thereby ensuring conceptual consistency and facilitating future empirical validation.

The proposed empirical model will be assessed through a two-stage analytical procedure. The first stage involves evaluating the measurement model by examining reliability and validity indicators. Internal consistency is expected to be assessed using Cronbach's Alpha and Composite Reliability coefficients, while convergent validity will be examined through Average Variance Extracted (AVE) and factor loadings. Discriminant validity will be evaluated using accepted SEM criteria to ensure that the constructs capture distinct conceptual dimensions.

The second stage focuses on testing the structural relationships among the constructs. Structural Equation Modeling is proposed as the most appropriate analytical technique because of its ability to simultaneously examine direct, indirect, and mediating effects among multiple latent variables. Particular attention will be given to the mediating role of strategic flexibility in the relationship between SHRM and SME competitiveness. Bootstrapping procedures will be employed to evaluate the statistical significance of the hypothesized paths and mediation effects.

Through this methodological framework, the study provides a structured approach for future empirical testing of the proposed conceptual model. More importantly, it offers a foundation for examining how strategic human resource practices may strengthen organizational adaptability and competitiveness among SMEs operating in the challenging context of small transition economies.

5. Expected Contributions and Implications

The proposed model contributes to the growing body of research examining the relationship between Strategic Human Resource Management (SHRM) and organizational competitiveness by providing an integrated framework that links strategic HR practices, strategic flexibility, and SME performance. More specifically, the model seeks to explain how investments in human capital can be transformed into competitive outcomes through the development of organizational adaptability.

The theoretical logic underlying the proposed framework is reflected in the four hypotheses advanced in this study. The first hypothesis (H1) assumes that Strategic Human Resource Management positively influences SME competitiveness. This relationship is grounded in the argument that strategic HR practices enhance employee capabilities, organizational commitment, and workforce performance, thereby contributing directly to productivity growth, employee retention, and market responsiveness.

The second hypothesis (H2) proposes that Strategic Human Resource Management positively influences strategic flexibility. From a dynamic capabilities perspective, organizations that invest in employee development, participatory leadership, performance-oriented reward systems, and talent retention are better positioned to adapt their resources and processes in response to environmental changes. Such practices strengthen the firm's ability to learn, innovate, and respond effectively to uncertainty.

The third hypothesis (H3) suggests that strategic flexibility positively influences SME competitiveness. In the context of small transition economies, firms that demonstrate higher levels of adaptability are expected to respond more rapidly to market changes, exploit emerging opportunities, and maintain stronger competitive positions. Strategic flexibility therefore represents a critical organizational capability linking adaptation and performance.

Finally, the fourth hypothesis (H4) introduces strategic flexibility as a mediating mechanism between SHRM and SME competitiveness. This proposition represents the central contribution of the proposed model. Rather than assuming that HR practices automatically generate

competitive advantage, the framework argues that competitiveness emerges because strategic HR systems strengthen organizational flexibility and adaptive capacity. Consequently, strategic flexibility acts as the mechanism through which human capital investments are translated into sustainable competitive outcomes.

Taken together, the proposed hypotheses provide a coherent explanation of how SMEs may strengthen competitiveness through internally developed capabilities rather than relying exclusively on financial resources or technological investments. By integrating Strategic Human Resource Management, Dynamic Capabilities Theory, and SME competitiveness literature, the model offers a relevant framework for future empirical research and practical guidance for managers operating in small transition economies.

6. Conclusions

This study develops a conceptual framework that examines the relationship between Strategic Human Resource Management (SHRM), strategic flexibility, and SME competitiveness within the context of small transition economies. Drawing upon the Resource-Based View and Dynamic Capabilities Theory, the paper argues that strategic HR practices should be viewed not merely as administrative tools but as organizational capabilities that contribute to long-term competitiveness.

The proposed model suggests that investments in training intensity, performance-based compensation, talent retention mechanisms, and participatory leadership enhance organizational adaptability and strengthen strategic flexibility. In turn, strategic flexibility is expected to improve SME competitiveness through greater productivity, stronger employee retention, and improved responsiveness to changing market conditions. By positioning strategic flexibility as a mediating mechanism, the study offers a more comprehensive explanation of how human resource practices may be transformed into competitive outcomes.

From a theoretical perspective, the paper contributes to the integration of Strategic Human Resource Management and Dynamic Capabilities Theory by emphasizing the role of adaptive organizational capabilities in explaining competitive performance. The proposed framework extends existing research by highlighting strategic flexibility as a critical link between human resource management and organizational competitiveness, particularly in environments characterized by uncertainty and resource constraints.

The study also provides practical implications for SME managers and policymakers. For managers, the findings reinforce the importance of viewing human resource management as a strategic investment rather than an operational function. Developing employee competencies, retaining talent, promoting participation, and aligning reward systems with organizational objectives may strengthen organizational resilience and support sustainable competitiveness. For policymakers, the framework highlights the need for initiatives that support workforce development, managerial capabilities, and organizational innovation among SMEs operating in transition economies.

Despite its contributions, the study is limited by its conceptual nature and the absence of empirical testing. Future research should validate the proposed model through survey-based studies involving SMEs across the Western Balkans and other transition economies. Additional research may also explore the influence of contextual factors such as firm size, industry characteristics, organizational age, and environmental dynamism on the relationships proposed in this study.

Overall, the paper advances the argument that sustainable SME competitiveness increasingly depends on internally developed capabilities rooted in people, knowledge, and organizational adaptability. In environments characterized by uncertainty and continuous change, Strategic

Human Resource Management may therefore represent not only a support function but a dynamic capability capable of driving long-term organizational success.

Transformimi Digjital dhe Inteligjenca Artificiale në Arsim: Perspektiva Teorike dhe Zbatimi në Kontekstin Shqiptar!

Vilson Shehu

Abstrakt

Ky studim në nivel doktorature analizon në mënyrë të thelluar procesin e transformimit digjital dhe rolin e inteligjencës artificiale (IA) në sistemin arsimor shqiptar, duke kombinuar qasje teorike bashkëkohore me analiza praktike dhe empirike. Transformimi digjital konceptohet si reformë strukturore që prek organizimin institucional, kurrikulën, praktikat pedagogjike dhe marrëdhëniet midis aktorëve arsimorë. Studimi mbështetet në literaturë ndërkombëtare, raporte institucionale evropiane dhe globale, si dhe në analiza të të dhënave kombëtare dhe burime empirike nga komunitetet profesionale të mësuesve dhe organizatat rinore. Gjetjet tregojnë se, ndonëse Shqipëria ka bërë progres të konsiderueshëm në infrastrukturë dhe aftësi digjitale, integrimi sistemik dhe etik i IA në arsim mbetet sfidë e hapur.

Fjalët Kyçe: Inteligjenca Artificiale, sistem arsimor, integrim, progres, transformim dixhital

1. Hyrje

Transformimi digjital përfaqëson një nga proceset më domethënëse të ristrukturimit të sistemeve arsimore në nivel global. Në dekadat e fundit, teknologjitë digjitale kanë kaluar nga mjete ndihmëse periferike në faktorë strukturorë që ndikojnë drejtpërdrejt në mënyrën e prodhimit, shpërndarjes dhe vlerësimit të dijes. Inteligjenca artificiale, si fazë e avancuar e këtij transformimi, po sfidon modelet tradicionale pedagogjike dhe institucionale.

Në Shqipëri, pandemia COVID-19 shërbeu si katalizator për përshpejtimin e digjitalizimit arsimor. Mësimi online, platformat digjitale dhe përdorimi i mjeteve teknologjike u bënë domosdoshmëri, duke ekspozuar njëkohësisht potencialin dhe kufizimet strukturore të sistemit arsimor. Ky studim synon të analizojë nëse dhe në çfarë mase Shqipëria është e përgatitur të kalojë nga digjitalizimi bazik drejt integrimit të inteligjencës artificiale si instrument pedagogjik dhe institucional.

2. Kuadri Teorik

Kuadri teorik i studimit mbështetet në tre shtylla kryesore: teorinë e transformimit digjital, teorinë e kapitalit njerëzor dhe qasjet socio-teknike. Transformimi digjital nuk trajtohet thjesht si adoptim teknologjik, por si proces kompleks që kërkon ndryshime organizative, kulturore dhe normative.

Teoria e kapitalit njerëzor thekson se investimi në aftësi, njohuri dhe kompetenca digjitale është parakusht për suksesin e çdo reforme teknologjike në arsim. Ndërkohë, qasjet socio-teknike argumentojnë se teknologjia dhe shoqëria bashkë-evoluojnë, duke e bërë të domosdoshëm analizimin e kontekstit institucional, etik dhe social të përdorimit të IA në arsim.

3. Rishikimi i Literaturës Ndërkombëtare

Literatura ndërkombëtare mbi inteligjencën artificiale në arsim evidencon një rritje të konsiderueshme të interesit akademik dhe politik në dekadën e fundit. Studimet tregojnë se IA

mund të kontribuojë në personalizimin e të nxënit, zhvillimin e sistemeve tutoriale inteligjente, automatizimin e vlerësimit dhe analizën prediktive të performancës së nxënësve.

Megjithatë, një pjesë e rëndësishme e literaturës kritike paralajmëron për rreziqe të tilla si varësia nga teknologjia, riprodhimi i pabarazive ekzistuese, mungesa e transparencës algoritmike dhe shkeljet e privatësisë së të dhënave. Këto debate teorike janë thelbësore për analizën e kontekstit shqiptar.

4. Metodologjia

Studimi përdor një qasje mixed-methods, duke kombinuar analiza cilësore dhe sasiore. Analiza cilësore përfshin rishikimin e literaturës akademike dhe dokumenteve strategjike kombëtare dhe ndërkombëtare për periudhën 2018–2024. Analiza sasiore mbështetet në të dhëna sekondare nga institucionet zyrtare.

Gjithashtu, është realizuar analizë tematike e diskutimeve, pyetjeve dhe sondazheve të zhvilluara në komunitete profesionale online të mësuesve, veçanërisht në grupin "Trajnime për Mësuesit" në Facebook, si dhe analiza e aktiviteteve të organizatave rinore që veprojnë në fushën e arsimit.

5. Analiza e Kontekstit Shqiptar

Analiza e kontekstit shqiptar tregon se transformimi digjital ka ndjekur një trajektore progresive, por jo gjithmonë koherente. Investimet në infrastrukturë digjitale dhe pajisje teknologjike kanë rritur aksesin në teknologji, veçanërisht në zonat urbane. Megjithatë, hendeku digjital midis zonave urbane dhe rurale mbetet i pranishëm.

Integrimi i IA në arsim mbetet i kufizuar kryesisht në përdorimin e platformave bazike digjitale, pa aplikime të avancuara analitike ose tutorimi inteligjent.

6. Trajnimi i Mësuesve dhe Kapitali Njerëzor

Trajnimi i mësuesve përbën një nga elementët më kritikë të transformimit digjital. Analiza e sondazheve dhe diskutimeve në grupin "Trajnime për Mësuesit" tregon se shumica e mësuesve kanë përmirësuar aftësitë teknike, por ndihen të pasigurt në integrimin pedagogjik të IA.

Kjo situatë reflekton nevojën për programe trajnimi të avancuara që kombinojnë pedagogjinë, etikën dhe teknologjinë, duke e parë mësuesin si aktor kyç të inovacionit arsimor.

7. Roli i Shoqërisë Civile dhe Edukimit Joformal

Organizatat e shoqërisë civile dhe iniciativat rinore luajnë rol të rëndësishëm në plotësimin e boshllëqeve të sistemit formal arsimor. Organizata rinore The Youth of Ura ka kontribuar në promovimin e aftësive digjitale, edukimit qytetar dhe përdorimit etik të teknologjisë në arsim.

Këto iniciativa demonstrojnë potencialin e partneriteteve publike–private dhe shoqërore në mbështetjen e transformimit digjital.

8. Diskutim

Diskutimi tregon se transformimi digjital në arsim nuk është proces linear apo thjesht teknik. Në mungesë të reformave kurrikulare, kuadrit etik dhe investimit në kapital njerëzor, ekziston rreziku që teknologjia të mbetet sipërfaqësore.

Integrimi i IA kërkon qasje sistemike që harmonizon teknologjinë me objektivat pedagogjike dhe sociale.

9. Implikime për Politikat Publike

Studimi sugjeron nevojën për hartimin e një strategjie kombëtare për inteligjencën artificiale në arsim, të harmonizuar me standardet evropiane. Politikat publike duhet të fokusohen në reduktimin e pabarazive digjitale, forcimin e kapaciteteve institucionale dhe garantimin e mbrojtjes së të dhënave.

Gjithashtu, nevojitet investim i qëndrueshëm në kërkim shkencor arsimor.

10. Përfundime

Studimi konkludon se Shqipëria ka hedhur hapa të rëndësishëm drejt digjitalizimit të arsimit, por integrimi i inteligjencës artificiale kërkon reforma më të thelluara strukturore. Transformimi digjital duhet të konceptohet si investim afatgjatë në kapitalin njerëzor dhe zhvillimin e qëndrueshëm kombëtar.

Hulumtimet e ardhshme duhet të fokusohen në vlerësimin empirik të ndikimit të IA në rezultatet mësimore dhe barazinë arsimore.

Abstract

Artificial Intelligence (AI) combined with real-time threat intelligence has emerged as a powerful approach for improving cybersecurity analysis and proactive defense. This research investigates the use of machine learning and predictive analytics to identify, classify, and forecast cyber threats using benchmark intrusion-detection datasets and live cyber threat intelligence sources. The proposed framework links public situational awareness platforms such as Radware Live Threat Map, Kaspersky Cyberthreat Real-Time Map, and Check Point ThreatMap with supervised classification, unsupervised anomaly detection, reconstruction-based deep learning, and time-series forecasting. Experiments were conducted on CICIDS2017 and UNSW-NB15 records using Random Forest, Support Vector Machine, K-Means, Autoencoder, and Long Short-Term Memory (LSTM) models. Random Forest achieved the strongest binary classification accuracy, while Autoencoders provided better anomaly detection balance than clustering. LSTM forecasting captured short-term changes in attack volume when chronological traffic windows were smoothed for operational trend analysis. The findings show that AI-assisted threat intelligence can improve detection accuracy, situational awareness, alert prioritization, and forward-looking security planning for modern organizations.

Keywords: *artificial intelligence; cybersecurity; threat intelligence; intrusion detection; anomaly detection; predictive analytics*

1. Introduction

Cybersecurity operations have become increasingly difficult because organizations must defend cloud services, remote access systems, Internet of Things devices, APIs, web applications, and distributed enterprise networks at the same time. Attackers exploit this expanded surface through distributed denial-of-service activity, credential attacks, malware delivery, phishing, reconnaissance, exploitation of vulnerable services, and multi-stage intrusion campaigns. Traditional signature-based tools remain important, but they are not sufficient when adversaries change infrastructure quickly or when novel behaviors have not yet been encoded as signatures.

Real-time cyber threat intelligence (CTI) platforms add an external view of active threat behavior. Radware Live Threat Map, Kaspersky Cyberthreat Real-Time Map, and Check Point ThreatMap are examples of public platforms that visualize current attack activity, target regions, attack types, and threat intensity. Their main value for analysts is situational awareness: they show that cyber threats are not isolated events but part of constantly changing global patterns. However, visualization alone does not produce automated classification, anomaly detection, or prediction.

AI offers the analytical layer required to convert security data into proactive defense intelligence. Supervised learning can identify known attack types; clustering and reconstruction-based learning can expose abnormal traffic that does not fit benign baselines; and sequence models can forecast short-term attack intensity. This paper develops an integrated AI and CTI framework for cybersecurity analysis and evaluates machine learning and predictive analytics models using CICIDS2017 and UNSW-NB15 benchmark data.

The contributions of the paper are:

(1) an AI-driven framework that connects benchmark intrusion detection data with live CTI context;
(2) a comparative evaluation of Random Forest, SVM, K-Means, Autoencoder, and LSTM methods;
(3) evidence that classification, anomaly scoring, and forecasting provide complementary defensive value; and
(4) operational guidance for integrating model outputs into security operations.

2. Background and related work

2.1 Cyber threat intelligence

Cyber threat intelligence is evidence-based information about existing or emerging threats. It can include indicators of compromise, malicious IP addresses and domains, malware hashes, exploit patterns, adversary tactics, vulnerabilities, and campaign behavior. Real-time CTI platforms extend this concept by presenting continuously updated threat observations from sensors, vendor telemetry, deception systems, cloud protection networks, and shared intelligence sources. These feeds help analysts understand context, but they become more valuable when connected to automated models that classify and prioritize events.

2.2 Machine learning for intrusion detection

Machine learning has been widely studied for intrusion detection because network attacks often change measurable flow features such as packet length, byte count, duration, inter-arrival time, flags, and connection state. Random Forest is effective for nonlinear classification and feature interaction analysis (Breiman, 2001). SVM models are useful for high-dimensional decision boundaries (Cortes and Vapnik, 1995). K-Means provides a simple unsupervised baseline for grouping traffic and identifying distant samples (MacQueen, 1967).Deep learning methods are useful where normal and malicious traffic overlap. Autoencoders learn compressed representations and can identify anomalies through reconstruction error; this idea has been applied to online intrusion detection systems such as Kitsune (Mirsky et al., 2018). LSTM networks can model temporal dependencies in ordered data and are therefore suitable for forecasting attack-volume trends (Hochreiter and Schmidhuber, 1997).

3. Research objectives

The first objective was to design a framework that combines real-time CTI observations with AI-based analysis. The second objective was to classify network traffic as benign or malicious using supervised learning. The third objective was to detect anomalous behavior using clustering and autoencoder reconstruction error. The fourth objective was to forecast attack intensity using LSTM-based predictive analytics. The final objective was to compare the practical strengths and limitations of each model family for security operations.

The study was guided by four research questions. RQ1: Which machine learning models provide the strongest attack classification performance? RQ2: Can unsupervised and reconstruction-based methods identify malicious behavior without relying solely on labels at inference time? RQ3: Can LSTM models forecast short-term attack trends with enough reliability to support proactive defense? RQ4: How can live CTI platforms improve situational awareness when combined with AI model outputs?

4. Methodology

4.1 Research design

The study used an experimental design organized around three analytical tasks: binary attack classification, anomaly detection, and short-term attack-volume forecasting. Supervised models were used where labeled examples were available; unsupervised and reconstruction-based models were used to estimate whether unseen traffic deviated from learned normal behavior; and LSTM networks were used to model temporal dependencies in ordered traffic windows.

The real-time threat intelligence component was treated as an operational context layer. Public threat maps do not normally expose all raw telemetry required for reproducible model training, but they provide examples of live attack indicators, geolocation trends, and attack-intensity signals that can be ingested by a security operations platform. The framework therefore combines static benchmark learning with a live CTI enrichment and reporting layer.

4.2 Data sources

CICIDS2017 was used as the primary flow-level intrusion detection dataset. The local workspace contained 2,830,743 records across weekday CSV files representing benign traffic and attacks such as DDoS, DoS Hulk, DoS GoldenEye, FTP-Patator, SSH-Patator, Bot, PortScan, Web Attack, Infiltration, and Heartbleed. A balanced local modeling sample of 29,793 records and 78 numeric features was used for classification and anomaly experiments, while the chronological weekday files were used for LSTM forecasting.

UNSW-NB15 was used as a second benchmark. The Zenodo mirror files were downloaded and parsed as tab-separated records with protocol, service, state, numeric traffic features, attack category, and binary label. To match the official partition sizes, the 175,341-row file was used for training and the 82,332-row file was used for testing.

The threat intelligence layer considered Radware Live Threat Map, Kaspersky Cyberthreat Real-Time Map, and Check Point ThreatMap as representative live CTI visualization sources. These sources can supply context such as attack direction, malware or DDoS activity, source and target geography, and current global threat intensity.

4.3 Preprocessing and feature engineering

Missing and infinite values were replaced with zero after invalid-value screening. CICIDS2017 numeric features were standardized for SVM, K-Means, Autoencoder, and LSTM-related processing, while Random Forest used the original numeric feature scale. UNSW-NB15 categorical variables were one-hot encoded and numeric variables were standardized. Binary labels were mapped to BENIGN and ATTACK, and multiclass labels were retained for a secondary Random Forest category experiment.

For forecasting, CICIDS2017 records were aggregated in chronological file order into 20,000-flow windows. The target variable was the count of attack flows in each window. A three-

window moving average was applied before LSTM training because operational threat intelligence is commonly consumed as a trend signal rather than as raw per-flow noise.

4.4 Model configuration

Random Forest was selected as a robust ensemble classifier capable of modeling nonlinear relations among network-flow features. Linear SVM was used as a scalable margin-based classifier for high-dimensional encoded feature spaces. K-Means was trained on benign traffic and used distance from cluster centroids as an anomaly score. Autoencoders were trained to reconstruct benign traffic, and reconstruction error was used as an anomaly score. Thresholds for K-Means and Autoencoder were selected on a calibration split to maximize attack F1-score. The LSTM model used eight historical windows to predict the next smoothed attack-volume window.

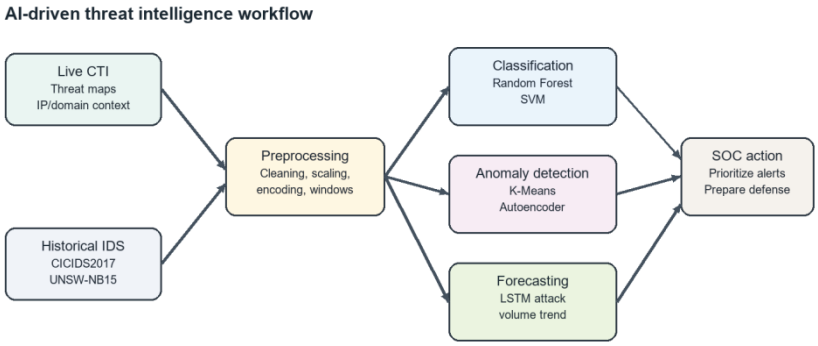

Figure 1. Proposed AI-assisted threat intelligence and predictive defense workflow

5. Experimental setup

CICIDS2017 experiments used the local MachineLearningCVE files and a balanced modeling sample of 29,793 records with 78 numeric features. The binary split used 23,834 training records and 5,959 test records. UNSW-NB15 experiments used 175,341 training records and 82,332 test records. Evaluation metrics included accuracy, precision, recall, F1-score, ROC-AUC, detection rate, false positive rate, mean absolute error, root mean square error, and symmetric mean absolute percentage error.

Table 1. Datasets and experimental roles

Dataset/source	Records used	Primary role	Labels or signals
CICIDS2017	2,830,743 raw; 29,793 modeling sample	Classification, anomaly detection, forecasting	Benign and attack categories
UNSW-NB15	175,341 train; 82,332 test	Classification and anomaly detection	Normal, attack categories, binary label
Radware, Kaspersky, Check Point maps	Live public CTI context	Situational awareness and deployment context	Threat intensity, attack geography, attack type indicators

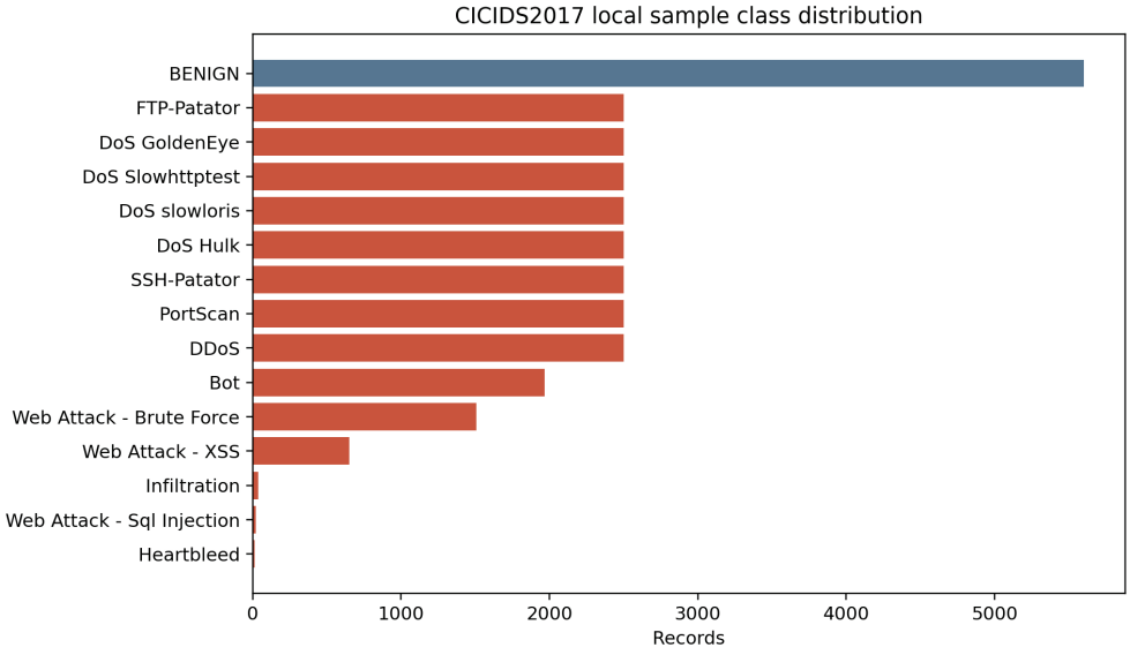

Figure 2. CICIDS2017 local sample class distribution

6. Results and analysis

The experiments show that the supervised models produced the strongest overall detection performance, especially on CICIDS2017. Random Forest was the best classifier in both datasets. SVM remained effective, particularly in ROC-AUC, but produced lower accuracy on the UNSW-NB15 partition because the encoded feature space and attack-category diversity make a linear margin less expressive than an ensemble of trees.

Table 2. Binary classification performance for ATTACK as the positive class

Dataset	Model	Accuracy	Precision	Recall	F1-score	ROC-AUC
CICIDS2017	Random Forest	99.68%	99.81%	99.79%	99.80%	0.999
CICIDS2017	Linear SVM	93.61%	97.94%	94.11%	95.98%	0.979
UNSW-NB15	Random Forest	86.92%	81.40%	98.84%	89.28%	0.980
UNSW-NB15	Linear SVM	83.00%	79.40%	93.34%	85.81%	0.954

On CICIDS2017, Random Forest achieved 99.68% accuracy and 99.80% attack F1-score on 5,959 test records. It misclassified only 19 records in the binary test partition. On UNSW-NB15, Random Forest achieved 86.92% accuracy and 0.980 ROC-AUC, showing strong separability even though the dataset contains more diverse traffic and attack categories.

Table 3. Anomaly detection performance for ATTACK as the positive class

Dataset	Model	Accuracy	Detection rate	False positive rate	Attack F1-score	ROC-AUC
CICIDS2017	K-Means	84.61%	100.00%	81.88%	91.34%	0.604
CICIDS2017	Autoencoder	89.48%	99.96%	55.80%	93.91%	0.792
UNSW-NB15	K-Means	62.87%	98.72%	81.04%	74.54%	0.698
UNSW-NB15	Autoencoder	83.41%	81.45%	14.18%	84.40%	0.877

The anomaly detection results show a common operational trade-off. K-Means achieved high attack recall after threshold calibration, but it also generated many false positives because benign and malicious flows overlap in feature space. Autoencoders provided a more balanced result on UNSW-NB15 and stronger attack F1-score on both datasets, supporting the view that reconstruction-based learning is better suited to complex network behavior than simple centroid distance.

Table 4. LSTM forecasting performance on CICIDS2017 chronological attack-volume windows

Window definition	Sequence length	Train sequences	Test sequences	MAE	RMSE	sMAPE
20,000-flow windows, three-window moving average	8	110	28	1314.85	1944.40	29.21%

The LSTM model achieved a symmetric mean absolute percentage error of 29.21% on the held-out chronological windows. The model tracked sustained attack bursts more reliably than abrupt transitions from benign to attack-heavy windows, which is expected in cyber event streams. In practice, this level of forecasting is useful for trend warning, capacity planning, and analyst staffing, but it should be paired with real-time detection rather than used as a standalone decision mechanism.

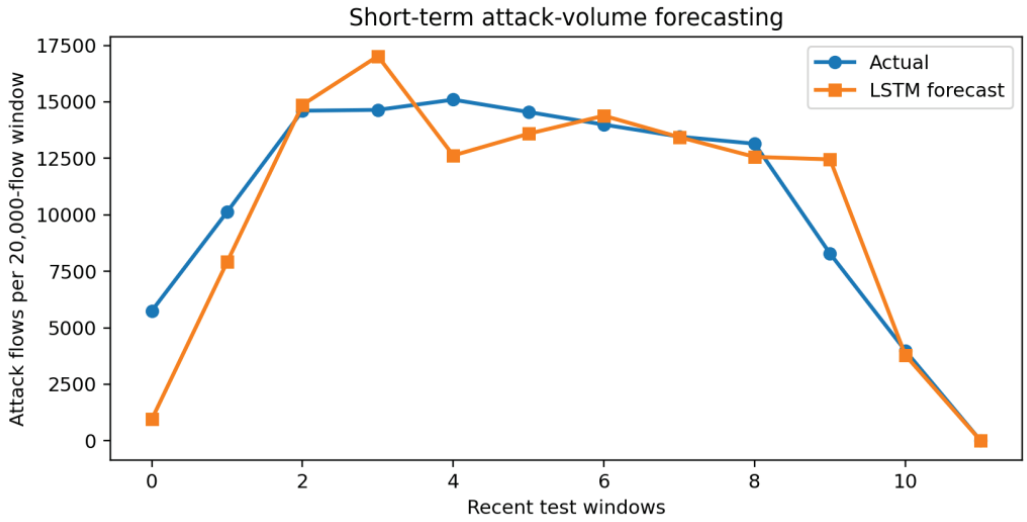

Figure 3. LSTM forecast on recent CICIDS2017 attack-volume windows

7. Discussion

The results support the argument that AI-driven cyber threat intelligence should be implemented as a layered analytical system. Random Forest is the most suitable model in this study when labeled training data is available, and the task is binary attack detection. SVM remains useful as a compact baseline, but it is less adaptive to nonlinear relations in mixed traffic features. Autoencoders are more useful than K-Means for practical anomaly detection because they learn a richer representation of benign behavior, while K-Means tends to over-alert when benign and attack flows share similar centroid distances.

The CTI layer improves the interpretation of model outputs. For example, a local increase in DDoS-like flows becomes more meaningful if live threat maps show elevated DDoS activity in related regions or industries. Similarly, a forecasted increase in attack-volume windows can support temporary monitoring increases, firewall rule review, cloud capacity planning, or SOC staffing decisions. The most defensible deployment pattern is therefore not to replace analysts, but to give them ranked alerts, model confidence, contextual indicators, and short-term trend warnings.

8. Security and operational implications

In an operational environment, the proposed framework can be integrated with SIEM, SOAR, IDS, firewall, endpoint detection, and cloud security platforms. Network-flow data would be ingested continuously, enriched with CTI indicators, scored by classification and anomaly models, and displayed to analysts as prioritized incidents. LSTM forecasts can be shown as early warning indicators for expected attack pressure in the next monitoring interval.

Governance is essential. Models should be retrained on current enterprise data, monitored for drift, protected against poisoning, and evaluated with false-positive cost in mind. Security teams should also preserve explainability where possible by exposing important features, anomaly score thresholds, and CTI evidence attached to each alert.

9. Limitations

The study has limitations. CICIDS2017 and UNSW-NB15 are benchmark datasets and may not fully reflect every modern enterprise environment. Public live threat maps are visualization tools and do not always provide complete raw telemetry for reproducible model training. The anomaly detection thresholds were calibrated with labeled validation data, which improves operational performance but means the system is not purely unsupervised. LSTM forecasting was performed on chronological CICIDS2017 attack-volume windows, while UNSW-NB15 was not used for forecasting because the downloaded partition does not provide a reliable timestamp field. Finally, adversarial robustness and model evasion were not deeply evaluated.

10. Conclusions

This research developed a journal-style AI and real-time threat intelligence framework for cybersecurity analysis and predictive defense. The experiments showed that Random Forest achieved the strongest classification results, Autoencoders provided stronger anomaly detection balance than K-Means, and LSTM forecasting captured short-term attack-volume trends after operational smoothing. The findings indicate that AI can significantly improve attack detection, situational awareness, alert prioritization, and proactive defense planning when combined with real-time CTI context.

Future work should focus on live API-based CTI ingestion, explainable AI dashboards, adversarial robust learning, privacy-preserving federated training, and deployment in production SOC environments where model quality can be measured against real incident outcomes.

Item	Location	Purpose
CICIDS2017 weekday CSV files	MachineLearningCVE/	Raw intrusion-detection data; 2,830,743 records and 78 numeric features
CICIDS2017 modeling sample	balanced_sample.csv	Balanced sample of 29,793 records
UNSW-NB15 benchmark files	UNSW_NB15/	175,341 training records and 82,332 test records

Appendix A. Preprocessing and model configuration

CICIDS2017 records were screened for invalid values, mapped into BENIGN and ATTACK classes for binary evaluation, and retained as multiclass labels for secondary attack-category evaluation. Missing and infinite numeric values were replaced with zero. Numeric features were standardized for SVM, K-Means, Autoencoder, and LSTM-related processing, while Random Forest used the original numeric feature scale.

UNSW-NB15 categorical variables were encoded and numeric variables were standardized before modeling. Anomaly detection models were trained on benign traffic and then evaluated against attack and benign samples using calibrated thresholds. Forecasting used chronological CICIDS2017 traffic aggregated into fixed-size attack-count windows.

Appendix Table A2. Core experiment settings

Experiment component	Configuration
Binary classification	CICIDS2017: 23,834 train / 5,959 test; UNSW-NB15: 175,341 train / 82,332 test
Random Forest	Tree-based supervised classifier for BENIGN versus ATTACK and secondary multiclass evaluation
Linear SVM	Scaled feature-space supervised classifier used as a margin-based baseline
K-Means threshold	CICIDS2017: 2.3838; UNSW-NB15: 1.6264
Autoencoder threshold	CICIDS2017: 0.015536; UNSW-NB15: 0.001472
LSTM forecasting	20,000-flow windows, sequence length 8, three-window moving average of attack-flow counts

Appendix B. Confusion matrices and reproducibility checks

Appendix Table A3. Binary classification confusion matrices

Dataset	Model	Attack TP	Attack FN	Benign FP	Benign TN
CICIDS2017	Random Forest	4829	10	9	1111
CICIDS2017	Linear SVM	4554	285	96	1024
UNSW-NB15	Random Forest	44807	525	10240	26760
UNSW-NB15	Linear SVM	42314	3018	10980	26020

Bilateral Cybersecurity Agreements as Instruments of International Law: The Case of Albania and Israel

Klajd Heta[1], Av. Gea Alibeaj[2], Kevin Heta[3]

1 Embassy of Israel in Albania
2 Kalo & Associates
3 Academy of Armed Forces of Albania

Abstract

In the framework of the accelerated technological developments and the increasing prevalence of cyber threats in the international arena, international cooperation in cybersecurity has turned into a relatively important component of international law. This paper aims to analyze the role and significance of bilateral agreements in this framework, by taking as an example the cooperation agreement between the National Authority for E-Certification and Cyber Security of Albania and the Israel National Cyber Directorate. From a legal and formal perspective, the study examines the nature, structure, and function of such an agreement, as an instrument of international law, including their impact on strengthening national capacities to effectively respond to cyber threats. Through an empirical approach, the paper explores the practical implementation of the cybersecurity bilateral agreement between the Albanian and Israeli respective authorities, including other institutional and technical cooperation in response to cyber incidents that have recently occurred in Albania. The paper also addresses the broader implications of such cooperation for enhancing the economic and trade relationship between both states, through official information retrieved by official statistics and secondary sources. This aims to depict that cybersecurity is also important for sustainable economic development and international trust. All in all, the study contributes to the existing literature by offering an integrated legal and practical analysis of international cooperation in the digital age, through a specific example as it is the bilateral agreement between Israeli and Albanian cyber authorities.

Keywords: *bilateral agreements, cybersecurity, international law, trade*

JEL CODE: K33

1. Introduction

Bilateral agreements play a significant role in the development, maintenance and cooperation between countries in an increasingly interconnected world. They are usually formed between two sovereign states, and serve as essential legal and diplomatic instruments that permit certain countries to establish mutual obligations, protect shared interests, and strengthen political, economic, and social relations. Through bilateral agreements, countries are able to negotiate terms that mirror their specific needs and priorities, making them more flexible and practical than broader multilateral arrangements. They contribute significantly to international stability by creating clear frameworks for various areas of cooperation. In addition, they reinforce the principles of international law by ensuring that states respect commitments, uphold treaties, and cooperate in accordance with the recognized legal norms and standards. As globalization continues to increase interdependence among nations, bilateral agreements have become even more important in addressing cross-border challenges such as terrorism, climate change, economic crises, and public health emergencies. By fostering trust, cooperation, and long-term partnerships, these agreements enhance diplomatic relations and also contribute to global peace, security, and sustainable development.

Provided that Europe is still in the process of evolving, and security threats are still evident, the attention should remain in bilateral or multilateral agreements that balance a state of security, including any field of cooperation between states that provides safety for their national integrity. Particularly in Europe, bilateral agreements are deemed to be capable of providing flexibility and compatibility for both involved countries (Murphy, 1991). During the past years, the concept of offensive from various countries has evolved from mainly physical or commercial, to a cybersecurity offensive. In a global context, more than twenty-two thousand cyber incidents, including twelve thousand intrusions involving data theft, were recorded in 2025, in which public administrations of various governments in a hundred and thirty-nine countries, were listed among the victims (Verizon, 2025). This analysis is going to look into the formal and practical cooperation that exists between Israel and Albania, in terms of cybersecurity.

2. Bilateral Relations between Israel and Albania

2.1. Establishment of relations between Israel and Albania

Albania has recognized Israel as a state since April 19th, 1949, although diplomatic relations between both countries were established only on August 19th, 1991. Since then, both countries have maintained a strong level of cooperation, which has been formalized through a vast array of agreements and memorandums signed between government agencies, such as *Culture, Education and Science; for the Promotion and Reciprocal Protection of Investments; in Veterinary Medicine; in Agriculture; on Trade and Economic Cooperation; in Plant Quarantine and Protection; in Bilateral Consultations; in Air Service; Visa Exemption for Holders of Diplomatic, Service and National Passports; in Health and Medicine; in the Avoidance of Double Taxation and Prevention of Fiscal Evasion with Respect to Taxes on Income; in Educational, Scientific, Cultural, Youth and Sports Cooperation; in Tourism* (Embassy of Israel in Albania, n.d.). Currently, both countries have their official missions established in both Tel Aviv and Tirana, which remain significantly active in promoting the capacities of each in culture, economy, agriculture technology, science, innovation, that boost and encourage reciprocal cooperation between both.

2.2. Memorandum of Understanding on Cybersecurity Cooperation

From an international relations perspective, a Memorandum of Understanding falls under the broad category of treaties. From a legal perspective, the title of a Memorandum of Understanding does not necessarily mean that the document is binding or not binding under international law (United States, Securities and Exchange Commission, 1998). To determine whether a particular Memorandum of Understanding is meant to be a legally binding document, one needs to examine the intention of the parties, and the position of the signatories. A more thorough analysis of the wording used in the Memorandum of Understanding will also clarify the precise context of the document.

One of the recent agreements between government agencies of Israel and Albania is the Memorandum of Understanding in Cybersecurity, which was signed on February 1st, 2023, between senior representatives of both countries, specifically by the National Authority on Electronic Certification and Cybersecurity of Albania, and the National Cyber Directorate of the State of Israel.In practice, most inter-agency Memorandums are treated as administrative or technical cooperation arrangements rather than formal treaties. They are commonly used to facilitate cooperation in different areas. Many explicitly state that they do not create legally enforceable obligations under international law. However, if the agencies act on behalf of their governments with proper authorization, and the agreement demonstrates a clear intention to establish binding obligations, the instrument may still be regarded as an international agreement attributable to the states themselves. International bodies generally examine the

substance, authority, and intent behind any agreement, rather than relying solely on the title or institutional level of the signatories.

In the case of the National Authority on Electronic Certification and Cybersecurity of Albania, and the National Cyber Directorate of the State of Israel, Article 2.2 of the Memorandum defines that the *MOU is not intended to create, maintain or govern any legally binding obligations, rights or benefits between the Sides or between the Sides and any third party. Each Side's implementation of this MOU is subject to that Side's own domestic laws, regulations, policies and international obligations, budget constraints, administrative requirements and international obligations.* This clause indicates that the MOU is intended to be a non-legally binding instrument. By stating that the MOU *is not intended to create, maintain or govern any legally binding obligations, rights or benefits,* the parties clearly express an intention to avoid the creation of enforceable legal commitments under international law. The clause also excludes enforceable rights not only between the parties ("the Sides") but also vis-à-vis third parties, reinforcing the political and cooperative nature of the arrangement rather than a juridical one. The second sentence further supports this interpretation by conditioning implementation on the domestic laws, regulations, policies, budgetary limitations, administrative requirements, and existing international obligations of each side. The use of such language preserves governmental discretion and avoids absolute commitments. Legally binding treaties usually contain mandatory obligations framed in more definitive terms, whereas this clause emphasizes flexibility and sovereign control over implementation. Ultimately, the MOU National Authority on Electronic Certification and Cybersecurity of Albania, and the National Cyber Directorate of the State of Israel is most likely to be classified as a political, administrative, or diplomatic cooperation instrument, often referred to as a ''soft law'' arrangement, rather than a binding treaty under the international law. Although the MOU carries political weight, diplomatic expectations, and practical significance, it would generally not be enforceable before international tribunals as a source of binding international obligations.

3. Implementation in Practice of the MOU on Cybersecurity Cooperation between Israel and Albania

Even when non-binding, MOUs can have a strong impact on bilateral cooperation, economic relations, but also investor confidence between countries. The reassurance that both Israeli and Albanian government agencies are in close contact regarding the cybersecurity ecosystem and safety, provides a positive approach to any Israeli investor who is seeking to relocate or do business in Albania, whether that involves working individually or partnering with an Albanian company. In terms of bilateral cooperation, MOUs between government agencies (as in this case) are generally processed with the intermediation, assistance and approval of higher authorities, such as the Ministry of Foreign Affairs of the respective country and/or the Embassy of the country in the counterpart state. In practice, an MOU often serves as an official political signal that the parties intend to strengthen cooperation in a particular sector. Although the instrument may not create enforceable obligations, it demonstrates diplomatic commitment, policy alignment, and institutional willingness to cooperate. This leads to better communication between governmental agencies, facilitates future agreements, and creates a more stable and predictable environment for joint initiatives and cross-border projects. MOUs may also positively influence investors and private-sector actors. International investors often assess political relations, regulatory cooperation, and governmental stability before committing capital to foreign markets. The signing of an MOU can lead to the improvement of bilateral relations, openness to foreign investment, and governmental support for economic collaboration. MOUs are frequently used to announce strategic partnerships and encourage business confidence. While investors understand that non-binding MOUs do not guarantee legal protection by themselves, such instruments can still enhance credibility, reduce perceived political risk, and

indicate that both governments are moving toward deeper economic cooperation. Albania has been a target of sophisticated cyberattacks conducted by external actors, particularly against the state digital infrastructure and government databases that contain sensitive and personal information. Every three minutes, Albania is a target of a cyber-attack (Elezi, 2025). Additional reports have indicated that the country faces cyber intrusion attempts on a frequent basis, highlighting the growing exposure of public institutions to cyber threats. One of the most serious incidents occurred in July 2022, when the digital government infrastructure of Albania was a subject of a large-scale cyber operation that disrupted public services, disabled official government websites, and involved data theft, ransomware deployment, and destructive malware activities. Investigations concluded that the attackers sought to compromise critical digital infrastructure and gain access to confidential Parliament of Albania was also affected by a cyber incident that temporarily disrupted parliamentary systems and email communications. Although government officials declared that no classified information had been compromised, the incident had similarities to the broader cyber campaign directed against the Albanian governmental institutions throughout 2022. In another significant case, the National Institute of Statistics of Albania experienced a cyberattack in early 2023 that affected segments of its internal digital systems.

Recently, the Municipality of Tirana became the target of another major cyberattack in June 2025. According to reports, the attackers successfully infiltrated the digital infrastructure of the institution by exploiting known vulnerabilities in Microsoft Exchange email servers, therefore obtaining both initial and continued access to the systems of the Municipality of Tirana (Agjencia Telegrafike Shqiptare, 2025). Authorities identified numerous malicious attempts to compromise email accounts, followed by unauthorized logins originating from suspicious IP addresses. The attackers subsequently managed to corrupt documents, databases, and backup systems, causing significant disruption to a range of municipal public services. Restoration efforts required extensive technical intervention and specialized cybersecurity measures in order to recover affected systems and re-establish operational stability. Under the umbrella of the MOU signed between both authorities, the assistance from the Israeli side, as a more advanced technological state, has been immediate (i24NEWS, 2022). Information sharing is critical, as in the case of the MOU, it helps both countries to maintain cyber resilience, raise awareness and further develop diplomatic and international cooperation (Pavel, 2025). All of these occurrences have generated a domino effect also on the business inquiries from Israel to Albania. Official data provided by the Economic Department at the Embassy of Israel in Tirana shows that following the signature of this agreement and the aforementioned occurrences that have centralized the cybersecurity cooperation between Israel and Albania, the inquiries from Israeli companies that operate in cybersecurity and relevant subsectors significantly increased. Up to a hundred companies from 2023 to 2026 have addressed the Economic Department of the Embassy of Israel in Tirana, seeking connections in the public and/or private sector of Albania, which depict compatibility with the need and the usefulness of cybersecurity services for their daily operations. In September 2023, the Embassy of Israel in Albania hosted a business-to-business conference, in cooperation with the Export Institute of Israel and the Chamber of Commerce and Industry of Tirana, where cybersecurity was one of the main topics of the event, with Israeli private companies exchanging business communication with private and public companies. The Economic Department of the Embassy of Israel in Albania has organized since 2024, Tirana Beer Tech, a quarterly gathering of technology enthusiasts, where cybersecurity has been a part of the sessions more than once, through Israeli experts that have addressed the session. In May 2026, Tirana hosted the Albania - Israel Cybersecurity Summit, an event that brought together forty leading Israeli companies specializing in cybersecurity and advanced technologies. The summit focused on enhancing cooperation in the field of cybersecurity, promoting technological innovation, and fostering new strategic partnerships aimed at supporting the economic growth of Albania and the wider region. Particular emphasis was

placed on the role of knowledge-sharing, innovation, and digital transformation as essential drivers for accelerating development and strengthening secure, competitive, and sustainable economies. From a more expanded international relations perspective, it is evident that the cooperation of Albanian private companies with the Israeli ones, could be a significant advantage of the path of Albania towards joining the European Union, especially if the European single market is considered. The cybersecurity market falls under the four freedoms of the European Union, and while it is in constant change, so is the concept of innovation in Israel, where updates are taking place often. Zajmi (2010) explains that the European single market is subject to the multitudinous means of impact, creating an ongoing process of evolution. To Albania, as an aspiring European Union member, new questions should receive new answers, through the development of renewing strategies to address challenges and problems. This will help Albania to be better prepared towards its path into the European Union, and to have already laid its ground in the moment of acceptance.

4. Conclusion

In conclusion, the growing cybersecurity cooperation between Albania and Israel demonstrates how shared security challenges can evolve into broader strategic, economic, and diplomatic opportunities. The repeated cyberattacks against Albanian institutions have highlighted the urgent need for stronger cyber resilience, advanced technological capacities, and international partnerships capable of addressing increasingly sophisticated threats. Through bilateral agreements, knowledge-sharing initiatives, business cooperation, and joint technological events, Albania has strengthened its institutional and private-sector engagement with Israeli expertise in cybersecurity and innovation. At the same time, this partnership has generated tangible economic and strategic benefits by encouraging foreign business interest, fostering technological exchange, and supporting the long-term digital transformation of Albania. Within the broader framework of the integration in the European Union, such cooperation also contributes to the alignment of Albania with evolving European Union standards related to cybersecurity, innovation, and the digital single market. Consequently, the Albania - Israel cybersecurity partnership represents a response to immediate security concerns and an important strategic instrument for the modernization, international positioning, and future integration of Albania into the European Union.

Alternativat e denimit me burgim, drejtesia restauruese, kushtet e aplikimit dhe rendesia e tyre ne te drejten penale

Renata Halimi

renatahalimi65@gmail.com

Msc.Av.Endri Fejzullah

endrifejzullahu@hotmail.com

Abstrakti

Procesi penal eshte shpesh i larmishem ne interpretim dhe kompleks per sa i perket veprave penale, anes se tyre subjektive dhe objektive, rendesise se faktit, proporcionalitetit dhe interpretimit procedurial e material te tij. Pavaresisht veprave penale, ligjvenesi ka parashikuar edhe kushtet kur ndeshkueshmeria duhet ti sherbeje qellimit ne teresi, ajo qe nepermjet doktrines juridike quhet drejtesia restauruese, pavaresisht se denimet alternative ne praktike mund t'i adresohen faktit te mbipopullimit te burgjeve i cili eshte nje tjeter problem i zbatimit te masave te sigurise ku kryefjale e tyre ne pjesen derrmuese te rasteve eshte "Arresti me burg".

Ne kushtet kur teorikisht drejtesia restauruese sherben qe fokusi te mos jete izolimi nga shoqeria, por nepermjet denimeve alternative te arrihet qellimi ndeshkimor, edukues dhe riintegrues i individit. Interpretimi harmonik nuk mund te jete alternativ e as kumulativ per aplikimin e neneve 58 -65 te Kodit Penal te Republikes se Shqiperise, por specifik ,i posacem e shpesh i determinuar nga rrethanat e ceshtjes.

Denimi me burgim (heqja e lirise) ka qene nder mjetet kryesore ndeshkimore penale ne luften ndaj kriminaliteti dhe hapja e burgjeve te reja ne shume vende te botes si dhe mbipopullimi i tyre ka treguar se jo ne te gjitha rastet ndeshkueshmeria me burgime qofte dhe afatgjate kane qene efektive ne qellimin integrues dhe risocializues te kryeresit te vepres penale. Ne kushtet kur qellimi i denimit eshte ndeshkimi, edukimi dhe risocializimin e subjektit ne shoqeri, shkenca e se drejtes penale e ka pare alternativen e denimit me burgim, vecanerisht ne 30 vitet e fundit pas ndryshimeve te medha politike ne Evrope, si nje mjet i cili i sherben humanizmit, ul kostot ekonomike e financiare shteterore per te burgosurin si dhe nepermjet parimit te humanizmit eshte parapare qe alternativat e denimit me burgim t'i sherbejne qellimit te ndeshkimit dhe riintegrimit te subjektit me shpejt dhe me mire nga sa do te ishte ekzekutimi i vendimit me burgim qe ne shume raste e studime te ndryshme ka rezultuar me pasoja negative se sa pozitive , kur ne vend te tij ka qene plotesisht e mundur aplikimi i nje denimi alternativ.

Fjale kyçe: *Alternative, drejtesi restauruese, kriminalitet, humanizem*

I. HYRJE

Llojet e denimeve alternative

Ne historine e te drejtes penale, e kryesisht ne shekullin e XVIII njihen denime te renda, qofshin keto edhe fizike, sic mund te kene qene gjymtimi i personave qe kryenin vepra penale apo denimi me vdekje i cili eshte ende ekzistent sot ne disa vende te botes, perfshire ketu edhe ne disa shtete te SHBA-se. Keto mekanizma te luftes ndaj kriminalitetit kane treguar se jo gjithnje e domosdoshmerisht kane patur efikasitet ne uljen apo parandalimin e kryerjeve te veprave te ndryshme penale. E kunderta eshte e vertete qe, ne vendet ku ekonomia eshte relativisht e dobet, sistemet politike jane shtypese, niveli kulturor, arsimor, qytetar dhe mungesa e interesimit per te qene pjese aktive ne vendimmarrjet publike te njerezve, denimi me vdekje nuk ka qene kurre prandalues i kriminalitetit dhe aspak efikas. Gjithnje ka sherbyer si nje mjet

represiv ne duart e pushtetit per te parandaluar me shume se krimin kunder jetes, krimet kunder te ashtuquajturit rend popullor dhe eshte lehtesisht e verifikueshme qe ne shume vende te Evropes lindore perpara viteve 90', perfshire ketu edhe vendin tone, apo duke marre si reference sot edhe vende diktatoriale si Koreja e Veriut, Republika Popullore e Kines, Kuba, Republika Islamike e Iranit tj, krimi me i rende konsiderohej dhe konsiderohet "lufta" kunder pushtetit. Duke iu referuar edhe Shqiperise perpara viteve 90', konstatohet se vendet te cilat kane denimin me vdekje, nuk kane qellimin paresor luften efikase ndaj kriminalitetit, por luften kunder subjekteve qe rrezikojne ate dhe qe ne keto vende quhet, rend kushtetues apo rend popullor

Duke pare zhvillimin e vendeve shkenca e te drejtes penale ka avancuar duke e konsideruar subjektin e deklaraur fajtor te vepres penale jo vetem si subjekt mbi te cilin duhet te veproj ligji dhe ndeshkimi, mirepo edhe nje subjekt i cili perpos ndeshkimit dhe vleresimeve nepermjet nje procesi te rregullt ligjor te elementeve subjektiv dhe objektiv te vepres penale.[1]

❖ Gjysmelirira

Gjysmeliria apo sic quhet ndryshe***" semi liberte"*** eshte nje nder alternativat e denimit me burgim ku konsiston ne faktin qe subjekti i cili me vendim gjyqesor shpallet fajtor dhe denohet deri ne nje vit burg, mundet qe ne varesi te disa kushteve te percaktuara ne ligj, t'i mundesohet cdo dite brenda oreve te caktuara nga 6-10 ore ne dite qendrimi ne liri dhe pas perfundimit te oreve te lirise te rikthehet ne IEVP[2]. Kuptohet edhe nga sanksioni qe parashikon gjysmeliria, qe te tille subjekte nuk paraqesin rrezikshmeri te larte shoqerore, vepra e tyre penale nuk konsiderohet shoqerisht e rrezikshme, mund te jete subjekt i rrethanave lehtesues qe parashikon Kodi Penal. Kushtet e parashikuara nga neni 58 i Kodit Penal per aplikimin e kesaj alternative jane lidhen me kushtin kryesor, ate te denimit te subjektit me burgim deri ne nje vit burg, ndersa kushtet e posacme per aplikimin e kesaj dispozite ligjore jane kur personi ka: 1) detyrime per punen, arsimin apo aftesimin profesional, 2) pergjegjesite thelbesore ndaj familjes , 3) nevojen per trajtim ose rehabilitim mjekesor[3].

❖ Denimi me kusht

Denimi me kusht eshte nje nder frazat me te perhapura ne sistemin e drejtesise, nderkohe qe ligji dhe konkretisht neni 59 i Kodit Penal te Republikes se Shqiperise e njeh me termin "Pezullimi i ezkekutimi te vendimit me burgim dhe venia ne prove ". Praktikisht, titulli i nenit 59 pranohet si definicioni i denimit me kusht nga doktrina juridike dhe ky pezullim shoqerohet me disa kushte te vendosura nga gjykata dhe mbajtja kontakt e personit te denuar me Sherbimin e Porves eshte domosdoshmeri.

Kushti i pare eshte qe subjekti te shpallet fajtor dhe te ndeshkohet jo me shume se 5 vite burg. Pikepyetja se nese vepra penale qe i atribuohet parashikon nje sanksion minimal 6 vjet, nderkohe qe per aplikimin e kesaj alternative kerkohet maksimalja jo me shume se 5 vjet dhe gjykata bazuar ne nenin 53 te Kodit Penal i cili parashikon *: "Gjykata ne raste te vecanta, kur cmon qe vepra penale dhe autori i saj paraqesin rrezikshmeri te paket dhe jane te pranishme disa nga rrethanat lehtesuese dhe nuk eshte e pranishme asnje rrethane renduese ka te drejte te caktoj nje denim nen minimumin ose nje lloji denimi me te bute se ai qe parashikon dispozita perkatese"*[4]Ligjvenesi ka parashikuar vetem kushtin kryesor i cili ka te beje me msokapercimin e

[1] Neni 30 I Kushtetutes dhe neni 4 I Kodit te Porcedures Penale
[2] "E drejta Penale" dr.Ismet Salihu, fq.484
[3] Neni 58 I Kodit Penal
[4] Neni 53 I Kodit Penal

denimit me burgim deri ne 5 vjet dhe ekzistencen e nje kushti te posacem ne menyre qe te procedoj me kete denim alternativ. Kjo, per faktin se ashtu sic eshte elaboruar ne kete punim, qellimi nuk eshte vetem parimi i ekonomise, ku si pasoje e mbipopullimit te burgjeve shteti ka nje kosto te madhe financiare, por edhe fakti qe ne lidhje me denimin me kusht, por edhe me llojet e tjera te denimeve alternative kryefjala e shqiptimit te pezullimit te vendimit me burg eshte vetem rrezikshmeria e subjektit dhe objektit, ekzistenca e kushtit te posacem dhe e rrethanave lehtesuese. Kjo nuk mund te interpretohet si shkak qe cdo subjekt i ndeshkuar me me pak se 5 vite burg t'i aplikohet denimi alternativ kur mund te jete recidivist dhe kur gjykata kupton dhe arrin bindjen e saj te brendshme qe ne lidhje me subjektin e denuar nuk mund te arrihet qellimi i denimit me aplikimin e masave alternative. Mirepo gjithnje duhet mbajtur parasysh fakti qe sistemi penitenciar duhet te jete vetem kur arrihet bindja se izolimi i tij nga shoqeria eshte i nevojshem, ne te kundert, burgjet e mbipopulluara do duhet te kalojne nepermjet kanaleve politike, sic mund te jete amnistia, ku megjithese eshte nje insituti i rendesishem ne sherbim te parimit te humanizmit, shteti te drejte dhe ligjor, shpesh kalon nepermjet nje kalvari diskutimesh politike, se sa juridike. Kushti i dyte dhe i rendesishem eshte ai i posacem ku sipas nenit 59 te Kodit Penal duhet qe: 1) Kushtet shendetesore apo mendore , 2)kushteve te jeteses apo nevojave te vecante qe lidhen me familjen, shkollimin, punen, 3) Sjellja pas kryerjes se vepres penale[5]

Edhe ketu kryefjala lidhet me rrezikshmerine e personit, ku me siper e kemi elaboruar se si ajo cmohet nga gjykata nderkohe qe ketu, tek neni 59 del nje element I rendesishem, sjellja e autorit pas kryerjes se vepres penale. Kjo eshte nje rrethane lehtesuese e cila mund te interpretohet harmonikisht me nenin 49 te Kodit Penal qe parashikon se gjykata mund te marri parasysh edhe rrethana te tjera lehtesuese qe nuk jane parashikuar ne nenin 48 te ligjit material[6]. Sjellja pas kryerjes se vepres penale, mund te nenkuptoj faktin qe personi megjithese mund te kete qene ne nje mase shtrenguese jo arrest me burg apo arrest shtepie, ka patur gjithnje nje sjellje dhe gatishmeri per te degjuar, per t'u degjuar dhe per te qene perballe drejtesise. Ajo qe eshte me rendesi eshte fakti se kjo dispozite referon ne nenin 60 te ligjit material penal ku eshte e lidhur ngushtesisht nga ana kuptimore me pezullimin e ekzekutimit te vendimit me burg dhe venia ne prove, ku gjykata mund te detyroj te denuarin te kryej nje apo disa detyrime me teper te cilat jane te parashikuara ne nenin 60 te Kodit Penal I cili I jep gjykates qe te caktoj edhe keto detyrime ndaj subjektit. Rikthehemi per interepretim tek afati i venies ne prove te te denuarit te cilit i eshte pezulluar ekzekutimi me burg. Pyetja se sa kohe eshte periudha e denimit me kusht, ligjvenesi ka parashikuar ne piken 2 te nenit te sipercituar se per denime deri ne 2 vjet burg eshte sa dyfishi i denimit, pra nese subjekti eshte ndeshkuar me 1 vit burgim, atij do t'i pezullohet denimi ne 24 muaj sherbim prove. Nderkohe qe ne piken 3 te ketij neni parashikohet qe afati eshte 18 muaj deri ne 5 vjet, me prejashtim te rregullit te vendosur ne piken 2 te ketij neni. Kjo do te thote se nje person i denuar me 1 vit burg, ka sherbimin e proves 24 muaj, nderkohe qe edhe nje person qe mund te ndeshkohet me 2 vite e 8 muaj burg, mund te kete sherbimin e proves po 24 muaj, per arsye se afatet jane te percaktuara ne piken 2 dhe 3 te nenit 59, megjithese apriori mund te duken jo te drejta, por ajo qe e determinon jane rrethanat e ceshtjes, padyshim bindja e gjykates rreth rrezikshmerise se personit, rrethanat e posacme te shprehura ne menyre eksplicite ne ligj, rendesia e faktit dhe vepres penale qe i atribuohet si dhe sjellja e te pandehurit me organet e drejtesise[7].

Rrezikshmeria e vepres penale vlersohet nepermjet anes objektive qe autorit i saj, ose i pandehuri kane kryer, duke marre per baze, kohen, vendin, menyren, mjetet. Rrezikshmeria e autorit te vepres penale referon ne personalitetin e tij , ku gjykata merr per baze teresine e karakteristikave individuale qe formojne fizionomine e tij sociale, sic mund te jene mosha ,

[5] Neni 59 pika 1 e Kodit Penal
[6] Nenet 48,49 te Kodit Penal
[7] Neni 59, pika 2 dhe 3 e Kodit Penal

arsimi, gjendja sociale, gjendja familjare, gjendja gjyqesore, sjelljen e tij me organet e drejtesise,pendimin e te pandehurit, sjelljen me viktimen pas kryerjes se vepres penale etj. Nderkohe qe faji si element i anes subjektive eshte i rendesishem dhe faji i kryer me dashje eshte forma me e rende e vepres penale. Ne kete rast dashja direkte ka dy momente te rendesishme ne te drejten penale, ate qe shpesh gjykatat ne vendimet e tyre gjyqesore e karakterizojne si momentin volitiv, pra kur personi qe kryen vepren penale me dashje, e deshiron ardhjen e pasojes dhe momentin intelektual, kur personi e kupton se me veprimet apo mosvperimet e tij po ndermerr akt te kundraligjshem.

❖ Kryerja e nje pune ne interes publik

Kryeja e nje pune ne interes publik, aplikohet per ato vepra dhe fakte penale ku i denuari ploteson dy kushte. Kushti numer nje ka te beje me denimin e tij i cili nuk duhet te jete me shume se 1 vit burg. Kushti numer dy, nuk eshte si ne rastet e tjera qe krahas kushtit specifik kishte dhe kushte te posacme, ketu kushti i dyte lidhet me termin "rrezikshmeria" e personit, e cila cmohet nga gjykata ne baze te kritereve te percaktuara nga praktika gjyqesore. I denuari ne kryerjen e nje pune ne interes publik, konisderohet si denimi alternativ me i pershtatshem per te denuarin sepse perfitimi i tij nuk eshte vetem mosekzekutimi i denimit me burgim, por ligjvenesi shkon pertej alternatives se punes publike dhe qendrimit te tij ne liri, duke e konsideruar te denuarin pas perfundimit te kryerjes se punes ne interes publik, si te padenuar. Ndryshe nga gjysmeliria qe po te shikohet mire dispozita, nuk permendet rrezikshmeria e personit, mirepo ajo mund te cmohet kryesisht nga gjykata, tek kryerja e nje pune ne interes publik, cmohet rrezikshmeria e personit. Megjithese kushti specifik si per nenin 58 ashtu edhe per 63 te Kodit Penal eshte ndeshkimi deri ne 1 vit burg, kjo nuk do te thote apriroi aplikimi i nenin 63, sepse subjekti mund te jete perserites i vepres penale dhe gjykata duke marre per baza kushtet e posacme te parashikuara ne nenin 58 te Kodit Penal, cmon se izolimi i tij nga shoqeria duhet te behet pjeserisht, ne dallim nga neni 63 ku rrezikshmeria merr nje trajte me te gjere interpretimi te bazuar ne rrethanat e ceshtjes dhe ne personalitetin e kryeresit te vepres penale. Paragrafi i dyte i nenin 63 percakton se puna publike kryehet nga i denuari nga nje minimum 40 oraresh , deri ne 240 ore, brenda afatit 6 mujor. Ky detyrim per kryerjen e punes, duhet te jete me pelqimin e te denuarit i cili ne rast mospranimi kjo dispozite nuk aktiviziohet dhe ne rast pelqimi te tij, ai ka detyrimin te mbaj kontakte me sherbimin e proves, i cili i percakton llojin e punes qe ai do te kryej, vendin e punes qe do te kryej dhe oraret e punes , ku kuptohet se orari nuk mund te jete me shume se 8 ore pune ne dite, aq sa eshte e parashikuar edhe ne Kodin e Punes te Republikes se Shqiperise. Eshte e kuptueshme qe kjo pune eshte pa asnje lloji shperblimi..[8]

Tek kjo dispozite merr kuptim akoma dhe me shume kuptim qellimi i denimi alternativ. Eshte pranuar gjeresisht nga shkenca penale se qellimi i denimeve alterantive eshte te reduktoj demin e ardhur nga vepra penale dhe reduktimin e perfshirjes se individit ne sistemin e drejtesise penale, duke i sherbyer sa me mire drejtesise restauruese[9]. Mirepo cfare eshte drejtesia restauruese qe ne aplikimin e denimint alternativ dhe shpesh ne togfjaleshat qe gjykata citon , i referohet kur disponon me vendimin e arsyetuar? Drejtesia restauruese eshte ekuilibri ndermjet interesave te shoqerise per t'u mbrojtur nga kriminaliteti dhe interesave te autorit qe eshte ne konflikt me ligjin. Per te kuptuar me mire nenin 63 te Kodit Penal, analizen qe gjyakata marrin per baze kur aplikohet kjo dispozite , mjafton te hedhim veshtrimin ne vendimin nr.00-2025-1653 te dates 06.11.2025 te Kolegjit Penal te Gjykates se Larte te Republikes se Shqiperise, ku i pandehuri u kallezua per mjekim te pakujdesshem pasi gjate kohes se shtatezanise se nje nene, nuk kishte kuptuar anomaline me te cilin lindi femija. Gjykata e Shkalles se Pare Tirane e shpalli

[8] Neni 63 I Kodit Penal
[9] Shih Vendimin nr.62-2024-3976 date.18.07.2024 i Gjykates se Shkalles se Pare me J.P.Fier

fajtor dhe e denoj me 10 muaj burg dhe i aplikoj nenin 59 te tij duke e vene ne prove per nje periudhe 1 vit e 8 muaj. Vendimi u apelua, pasi mbrojtja kerkonte pafajesi . Gjykata e Apelit la ne fuqi pjeserisht vendimin e shkalles se pare, duke e ndryshuar ate tek denimi alternativ dhe vendosi aplikimin e nenin 63 duke detyruar te pandehurit te kryej 40 ore pune me interes publik. Sipas Gjykates se Apelit denimi duhej te ishte ne raport me rendesine e faktit, rrezikshmerine e tij dhe rrezikshmerine, formen dhe shkallen e fajit. Sipas Gjykates , rrezikshmeria e te pandehurit ishte e ulet dhe nuk mund te konsiderohej e asaj shkalle qe te prejashtonte ate nga aplikimii nenit 63. Gjithashtu ajo citoj nenin 1/c te Kodit Penal ku mbante parasysh parimin e humanizmit, individualizimit dhe dobishmerise dhe cmonte qe ky lloj aplikimi i denimit alternativ nuk binte ndesh me qellimin e denimit. I njejti vendim u la ne fuqi edhe nga Kolegji Penal i Gjykates se Larte, duke argumentuar se i pandehuri ka rrezikshmeri te ulet shoqerore, arsimim dhe profesioni i tij eshte i atille qe bazohet ne humanizem, ka mungese te denimeve te meparshme penale si dhe faktin qe personaliteti dhe gjendja e tij gjyqesore nuk kane treguar e nuk tregojne tendence te qendrueshme per shkeljen e ligjit penal[10]. Qellimi i denimit ne nje rast te tille mund te arrihej edhe ne forma alternative sic eshte neni 63 i Kodit Penal duke qene se i pandehuri u denua me 10 muaj burg. Dallimi midis formes alternative te caktuar ne Gjykaten e Shkalles se Pare dhe asaj te caktuar ne Apel e i lene ne fuqi nga Kolegji Penal i Gjykates se Larte eshte ne esencen e deshmise se penalitetit, ku me aplikimin e nenit 59 te KP, vendim me te cilin disponoj Gjykata e Shkalles se Pare, i pandehuri do te rezultonte ne deshmine e penaliteti "i denuar" [11], nderkohe qe me aplimin e nenit 63 te Kodit Penal, vendim me te cilin disponoj Apeli dhe u la ne fuqi nga Kolegji, subjekti pas kryerjes se 40 oreve pune ne sherbim publik , do te rezultoj "i padenuar".

❖ Qendrimi ne shtepi

Qendrimi ne Shtepi, eshte parashikuar nga Kodi Penal ne nenin 59/a te tij, duke qene nje nder denimet e tjera alternative. Per aplikimin e ketij lloji denimi alternativ se pari subjekti nuk mund te jete i ndeshkuar me me shume se 2 vite burg, ku perpos ketij kushti jane parapare dhe kushte te posacme , pra ekzistenca e nje rrethane te posacme te tilla si: 1) Per grate shtatezena ose nena me femije, nen moshen 10 vjec , qe jetojne me te, 2) per baballaret, qe kane pergjegjesi prinderore per femije, qe jeton me te, nen moshen 10 vjec, kur nena e tij ka vdekur apo eshte e pazonja per t'u kujdesur per te , 3) per persona ne kushte te renda shendetesore, qe kerkojne kujdes te vazhdueshem nga sherbimi shendetesor jashte burgut, 4) per persona mbi 60 vjec qe jane te paafte nga ana shendetesore , 5) per te rinjte, nen moshen 21 vjec, me nevoja te dokumentuara shendetesore, studimore, te punes apo pergjegjesive familjare . Nese shihet e harmonizuar dispozita e nenin 59/a te Kodit Penal, kuptohet dhe verehet qe ketu ligjvenesi nuk e ka parashikuar apo te shpreh ne menyre ekplicite rrezikshmerine e personit dhe perderisa nuk e ka shprehur ate nenkuptohet dhe cmohet nga gjykata qe personi duhet te vuaj denimin ne sistemin penitenciar. Mirepo ligjvenesi kur denimi eshte jo me shume se 2 vite burg dhe gjykata ka arritur ne perfundimin se qellimi i denimin realizohet vetem me izolimin e subjektit ne ambientet e IEVP-se , per arsye nga me te ndryshmet, psh recidivizmi, ka marre parasysh disa kushte te vecanta ku i denuari mund te perfitoj. Eshte pak e interpretueshme dhe e diskutueshme juridikisht nese ketu eshte parapare parimi i humanizmit, sepse nga permbajtja e pikes a dhe b te nenit eshte marre ne konsiderate familja si berthame e shoqerise dhe e cila gezon mbrojtje te vecante nga shteti *(shih nenin 53 dhe 54 te Kushtetutes)* dhe interesi me i larte i femijes se mitur, per te cilin shteti mban parasysh nevojat e tij per shkak te struktures moshore,

[10] Shih vendimin nr.00-2025-1651 dt.06.11.2025 i Kolegjit Penal te Gjykates se Larte te RSH
[11] Neni 69 pika b e Kodit Pena;[11] Shih Vendimin nr.62-2024-3976 date.18.07.2024 i Gjykates se Shkalles se Pare me J.P.Fier

qellimin qe i mituri te rritet ne nje ambient familjar, ambient gezimi e i rrethuar me dashuri *(shih nenin 2, 3 dhe 5 te Kodit te Familjes*). Ne kete dispozite deduksionohet (*vecanerisht per pikat a dhe b*) se nuk eshte mbajtur parasysh parimi i humanizmit dhe fakti se me aplikimin e qendrimit ne shtepi synohet arritja e qellimit te denimit, por interesi me i larte i te miturit. Parimi i humanizmit involvohet serish ne pikat vijuese te dispozites ne fjale, konkretisht ne pikat c, ç dhe d, ku kihet parasysh rrethanat e posacme qe kane te bejjne me te drejten e jetes, sic mund te jene kushtet e renda shendetesore, personat qe kane mbi 60 vjec apo per te rinjte nen moshen 21 vjec per arsyet e permendura ne ligj[12].

II. LIRIMI ME KUSHT

Lirimi me kusht eshte nje forme tjeter e alternatives se denimit me burgim, ku ne dallim nga alternativat e tjera, lirimi me kusht jepet vetem ne fazen e ekzekutimit te vendimit penal, bashke me qendrimin ne shtepi te parashikuar nga neni 59/a te Kodit Penal e cila perifrazon edhe kete togfjalesh *"Per denimet deri ne 2 vjet burg ose kur kjo eshte pjesa e mbetur e denimit..."* duke i kthyer keto dy dispozita ne mjete juridike ne duart e te denuarit per te perfituar nga vuajtja e denimit me burg ne IEVP. Neni 64 i Kodit Penal te Republikes se Shqiperise e parashikon lirmin me kusht vetem per *arsye te vecanta* dhe nese me sjelljen dhe punen e tij tregon se denimi i vuajtur eshte arritur qellimi per edukimin e tij[13] . Pra ajo qe kuptohet nga norma eshte fakti se arsyet e vecanta dhe treguesi se eshte arritur qellimi i denimit te tij duhet te plotesohen kumulativisht dhe jo alternativisht dhe se gama e interpretimit juridik eshte aq e gjere sa qe praktika gjyqesore eshte mjaft e pasur me kete institut te se drejtes, ku jo ne pak raste kompleksiteti i interpretimit te *"arsyeve te vecanta"* dhe *"arritjes se qellimit denimit*" ka rezultuar i veshtire dhe ka passjelle edhe nje vendim unifikues te Gjykates se Larte me nr.2/2015 per unfikimin e praktikes gjyqesore. Nga dispozita organi legjislativ togfjaleshit "arsye te vecanta" nuk i ka nominuar se cilat jane keto arsye, mirepo ka bere nje vleresim te pergjithshem. Vendimi Unifikues i sipercituar ka arritur ne konkluzionin se keto arsye te vecanta nuk jane te pavarur dhe jane ngushtesisht te lidhura me njera-tjetren me qellimin e institutit te lirimit me kusht i cili ka te beje me riedukimin dhe riintegrimin ne shoqeri te te denurit. Sipas Gjykates se Larte arsyet e vecanta nuk jane gje tjeter vecse rrethana konkrete, te cilat provojne se me denimin e vuajtur eshte arritur qellimi per edukimin dhe i denuari eshte i gatshem te kthehet ne shoqeri[14].

Qe kerkuesi te legjitimohet per te kerkuar lirimin e tij me kusht ai duhet te kete kaluar jo me pak se gjysmen e denimin per kundravajtje penale (deri ne dy vjet burg) , jo me pak se se 2/3 e denimit te dhene per krime me masa denimi gjer ne 5 vjet burg dhe jo me pak se ¾ per krime nga 5 vjet deri ne maksimumin e parashikuar nga ligji. Kodi yne Penal nuk lejon lirimin me kusht per te denuarit me burgim te perjetshem[15]. Ky eshte nje diskutim i rendesishem juridik, ku ne te drejten tone penale aplikohen parime e se drejtes sic eshte parimi i humanizmit, parimi i dobishmerise, individualizimit dhe i qellimit te ndeshkimit te denimit dhe ne te tilla kushte parimet e sipercituara sikur bien ne kolizion ne mosaplikimin e lirimit me kusht per te denuarit me burgim te perjetshem. Ne fakt artikulimi i sakte dhe i duhur do te ishte moslegjitimimi i tyre, pasi edhe personat e denuar dhe qe plotesojne kushtin kryesor te parashikuar ne nenin 64 te Kodit Penal, jo te gjithe lirohen para kohe me kusht, jo te gjithe kane arsye te vecanta, jo mbi te gjithe krijohet bindja e brendshme e gjykates, bindje e cila derivon si shkak i provave te paraqitura ne gjykim, lirohen. Mirepo keto subjekte kur plotesojne kushtin themelor kane te drejten e per te kerkuar para gjykates lirmin para kohe me kusht, duke u legjitimuar si subjekt dhe aprovimi apo jo i gjyaktes eshte teme tjeter. Pikerisht per faktin se jo cdo kush qe

[12] Neni 59/a I Kodit Penal
[13] Neni 64 I Kodit Penal
[14] Shih Vendimin Unifikues te Gjykates se Larte nr. 2/2015
[15] Shih nenin 65 te Kodit Penal

legjitimohen dhe ka te drejten e kerkeses per lirmin me kusht, lirohet, pikepyetja eshte se perse te mos rregullohet me ligj edhe per personat e denuar me burgim te perjetshem, legjitimimi i tyre per te kerkuar lirimin me kusht duke qene konform parimeve te Kodit Penal, frymes humaniste qe ligji penal ka ? Insituti i lirimit me kusht eshte nje institut i se drejtes ku edhe per personat qe kane te drejte te perfitojne lirmin me kusht ose me sakt te kerkojne nga gjykata lirimin, serish kalojne ne nje filter provash, shqyrtim rrethanash, bindje e brendshme e gjykates nese eshte arritur apo jo qellimi duke mbajtur parasysh edhe faktin per te cilin eshte denuar subjekti, rrezikshmerine e tij etj. Ligji ka bere edhe nje prejashtim tjeter, personat perserites nuk lejohet te lirohen me kusht. Ne fakt ketu dispozita duket me kuptimplote per nga permbajtja sepse recidivisti ka rrethana renduese qe I ndikojne ne rrezikshmerine e tij , personalitetin e tij dhe veeshtiresine per te krijuar bindjen tek gjykata ne lidhje me arritjen e qellimt te denimit. Gjithashtu, ligjvenesi eshte kujdesur qe disa marredhenie juridike te posacme qe mbron e drejta penale te mos perfshihen ne legjitimin e kerkuesit per te kerkuar lirim me kusht, duke bere keshtu nje mbrojtje te posacme te ketyre marredhenieve juridike qe jane cenuar nga kryeresi i vepres penale. Kjo per shkak te rrezikshmerise me te larte shoqerore qe keto vepra kane. Per te kuptuar me mire karakterin referues te “arsyeve te vecanta “ qe shprehet ne menyre eksplicite ne dispozite, gjykata gjate shqyrtimit te kerkese merr parasysh: 1) Raportin e Sherbimit te Porves, 2) raportit te Komisionit te IEVP-se (sjellja e tij ne isntitucion, masat disiplinore qe mund te kete ne institucion, marredheniet me familjen, marredheniet me shoqerine, rehabilitimi i tij qe nenkupton perfshirjen ne formim profesional apo punesim gjate vuajtjes se denimit etj), 3) kushtet formale te kerkese, kushte te parashikuara nga neni 64 i Kodit Penal dhe Kodit te Procedures Penale, 4) sjellja kundrejt viktimes, 5) rrethanat lehtesues te parashikuar ne nenin 48 dhe 49 te Kodit Penal , 6) rrethanat rendesue te parashikuara ne nenin 50 te Kodit Penal, 7) gjendja familjare 8) oferta e punesimit jashte burgut e cila eshte nje pike e rendesishme ne favor te te denuairt qe mund te krijoj bindjen tek gjykata per risocializimin e tij dhe dobishmerine e tij ne komunitet duke u punesuar etj, 9) vepren penale per te cilen eshte denuar

Ne referim te ketyre kushteve, per te kuptuar filtrin e gjere ne te cilen funksionon instituti i lirimit me kusht,kemi marre per analize vendimin e dates 22.09.2025 te Gjykates se Shkalles se Pare me Juridiksion te Pergjithshem Fier, ku kerkuesi pasi plotesonte kushte formale per te kerkuar lirimin me kusht, pasi paraqiti nje oferte punesimi nga jashte burgut, pas nje dekalrate ku shprehte pendese, marredhenieve te mira me familjen,sjelljes se tij te mire ne burg, *gjykata e rrezoj kerkesen e tij sepse konkludoj ne faktin qe pavaresisht sjelljes se tij te mire ne burg ai nuk ishte perfshire ne punesim apo formim profesional gjate vuajtjes se denimit, ka qene recidivist i vepres penale duke e bere me te veshtire bindjen e gjykates per permbushjen e qellimit te denimit, fakti qe paraqet risk rrezikshmerie prejardhja e tij shoqerore dhe mjedisi rrethues. Ne perfundim duke iu referuar akteve gjykata konkludoj per rrezikun e larte te perseritjes se cenimit te sigurise publike bazuar ne precedentet faktik, rrethit shoqeror problematik, mungeses se koherences ne rrefim, mungeses se angazhimit ne pune gjate vuajtjes se denimin duke vendosur ne fund rrezimin e kerkeses pasi vleresohet e pamundur riintegrimi ne kete faze*[16].

Faktit qe nje te denuari i rrezohet kerkesa e tij per lirimin para kohe me kusht, nuk do te thote se ai nuk mund te kerkoj serish te perfitoj nga ky institut i se drejtes, por duhet te plotesoj kriterin formal te parashkikuar ne ligj e konkretisht nenin 477 pika 2 te Kodit te Porcedures Penale qe parashikon se *:”Kerkesa nuk mund te perseritet para se te kene kaluar gjashte muaj nga dita kur vendimi i rrezimit te kerkeses te kete marre forme te prere*[17]*”.*

[16] Shih vendimin nr. 62-2025-5033 date 22.09.2025 I Gjykates se Shkalles se Pare me Juridiksion te Pergjithshem Fier
[17] Neni 477 I Kodit te Porcedures Penale

III. RENDESIA E DENIMEVE ALTERNATIVE

Denimet alternative ne te drejten bashkekohore penale duhet t'i pergjigjen rendesise se faktit, subjektit,rrezikshmerise se personit te cilen sic e kemi analizuar me siper eshte produkt i personalitetit te kryeresit te vepres penale qe merr ne konsiderate, arsimin e tij, formimin, moshen, sjelljen gjate dhe pas kryerjes se vepres penale, gjendjen familjare, gjendjen gjyqesore etj. Jurisprudenca e Gjykates Evropiane te te Drejtave te Njeriut e ka konsideruar jo vetem denimin alternativ si nje forme me balancuese midis nevojes per ndeshkim dhe mundesise se rehabilitimin te subjektit duke mbrojtur ne teresi te drejtat e shoqerise per te qene e sigurt nga nje ambient kriminal, duke ulur apo reduktuar pasojat e vepres penale, por edhe interesat e individit, familjes se tij dhe shoqerise. Gjykata Evropiane e te Drejtave te Njeriut ka arritur ne nje sere ceshtjes gjyqesore, ne konkluzionin se denimi me burgim te perjetshem ka forme cnjerezore dhe mizore tek i denuari[18]. Nga ky konkluzion, por edhe sic eshte cekur ne krye te heres tek ky punim, denimet alternative konsiderohen si denime ku reduktimi i pasojave te vepres penale dhe reduktimi i individit ne perfshirjen e tij ne sistemin penitenciar duhet te jene ne raport, perputheshmeri me vepren e kryer, rendesine e faktit penal, shkallen e fajin dhe rrezikshmerine e subjektit. Te gjitha keto element nuk jane per te lehtesuar apo stimuluar shoqerine ne vazhdimin e kryerjes se veprave penale, por nepermjet drejtesise restauruese, parimit te humanizmit, individualizimit dhe dobishmerise t'i sherbeje te denuarit dhe shoqerise.

Denimet alternative kane nje baze te shendosh argumentuese te shkences penale, ku nepermjes saj si dhe faktit se denimet me burgim kane pasoja negative tek I denuari dhe kur kryeresi I vepres penale eshte I atille qe ploteson kushtet themelore te aplikimit te denimit alternative, paraqet rrezikshmeri te paket, nuk ka tendeca kriminale, nuk eshte recidivist, sillet me korrektesi gjate gjykimi, shfaq pendese, atehere denimi alternative mund t'I sherbeje shume here me mire shoqerise, vete individit, pore dhe familjes se tij ne qellimin final qe ka ndeshkimi, qe eshte riintegrimi dhe risocializimi. Vleresimi i kushteve ne menyre kumulative dhe balancimi i peshores per qellimin e denimit alternativ, i cili eshte t'i sherbeje drejtesise restauruese, nuk duhet marre si dobesi e sistemit penal ne menyre qe shoqeria te bjere ne kontakt me krimin, ne rast te kundert kur dhe denimet alternative nuk i sherbejne individit per t'u integruar ne shoqeri, sigurisht qe izolimi mbetet e vetmja rruge per te arritur qellimin nepermjet mekanizmave qe shteti ka.

E gjithe analiza e lartpermendur, ishte per te kuptuar se rendesia qe paraqet denimi alternativ me burgim eshte: 1) t'i sherbeje te denuarit ne risocializim dhe riintegrimin e tij , 2) te ul kostot ekonomike te shtetit i cili me parate e shoqerise mban te burgosurit, 3) te ul mbipopullimin e burgjeve, ne menyre qe amnistia te mos jepet per kete fakt, por per arsye te tjera te shendetshme per shoqerine dhe te drejten penale, 4) t'i sherbeje drejtesise restauruese si balancuese e te drejtave te shoqerise per t'u mbrojtur nga kriminaliteti dhe te drejtave te individit dhe familjes se tij , 5) te parandaloj kryerjen e krimeve ne te ardhme dhe te jete pararoje e perfshirjes se te denuarit ne rehabilitimin e tij dhe perfshirjen e tij ne rrugen e drejte e te ligjshme, ne sherbim te familjes, shoqerise dhe shtetit.

IV. PERFUNDIMET DHE KONKLUZIONET

Sic edhe rezultoj nga punimi, denimet alternative jane forma te cilat nuk zevendesojne denimin fillestar i cili eshte ai me burgim, mirepo nepermjet tyre shkenca penale si dhe legjislatori ne shume vende te Evropes dhe me gjere i ka konsideruar si forma me te pershtatshme nepermjet se ciles qellimi i denimit mund te arrihet. Denimi perfaqeson shtrengimin shteteror qe zbatohet ndaj subjekteve te deklaruara fajtor per kryerjen e nje vepre penale, qe synon jo vetem ndeshkimin, por njekohesisht edhe edukimin, risocializimin dhe parandalimin e kryerjes se

[18](ceshtja Vinter dhe te tjere kunder Mbreterise se Bashkua , viti 2012)

veprave penale ne te ardhme. Keto komponent perfaqesojne denimin i cili ne fund duhet te kete patjeter dobishmerine jo vetem individuale, por edhe ate familjare e shoqerore duke e rikthyer individin nepermjet mekanizmave shteteror, te risocializiuar e te gatshem per te qene ne rrugen e drejte e te ligjshmerise ne shoqeri. E drejta penale e ka perkufizuar denimin edhe si rezultat i rrezikshmerise shoqerore te vepres penale, te autorit te saj, te shkalles se faji si dhe rrethanave lehtesuese dhe renduese. Venia ne peshoren e Justicias te ketyre komponenteve dhe provueshmeria e faktit se denimet me burgim qofshin afatgjata, por sidomos ato afatshkurtra kur vepra penale apo rrezikshmeria e personit eshte e atilla qe e favorizon ate per te kerkuar nje forme tjeter denimi, jane te demshme dhe aspak dobiprurese per individin, familjen dhe shoqerine ku ne jo pak raste eshte faktuar se burgimi nuk ka arritur qellimin e denimit ne teresi. Duke e konsideruar zhvillimin e jetes shoqerore, e drejta penale e ka pare denimin alternativ si forme per te reduktuar pasojat e vepres penale dhe perfshirjen e individite ne institucionet e paraburgimit dhe burgimit, kjo per t'i sherbyer drejtesise restauruese. Drejtesia restauruese buron jo vetem nga parimi i humanizmit dhe qellimi final i denimit, por edhe si nje ekuivalenc baraspeshuese e interesave te shoqerise dhe te drejten qe komuniteti ka per t'u mbrojtur nga kriminaliteti ne raport me ato te individit. Duke e pare ne kete kendveshtrim duket pak paradoksale qe ne te drejten penale pranohet dhe zbatohet parimi i humanizmit, drejtesise restauruese , mirepo prejashtohen te denuarit me burgim te perjetshem per te kerkuar gjyqesisht lirimin me kusht si institut i se drejtes. Kodi Penal i Republikes se Shqiperise eshte miratuar ne vitin 1995 ku te drejtes tone penale iu perfshine ato norma juridike apo ato institute te se drejtes qe ndoshta pak vite me pare, ne kohen e regjimit komunist as nuk mund te konceptoheshin e jo me te shqiptoheshin nga pushteti gjyqesor. Duke qene se shoqeria rritet, zhvillohet, politika po ashtu dhe te gjitha keto gershetohen me element te globalizimit, ristaurimi edhe i denimeve alternative eshte i domosdoshem, vecanerisht ne faktin qe parimi i humanizmit duhet te garantoj edhe parimin e barazise perpara ligjit, ku e drejta per te kerkuar lirmin me kusht , te jete e drejte e barabarte per te gjithe individet, perfshire ketu edhe ata te denuar me burgim te perjetshem. E drejta per te kerkuar lirmin me kusht nuk do te thote aprirori lirimi i te denuarit me burgim te perjetshem sepse e drejta per t'a kerkuar ate dhe perfitimi apo jo nga ky institut i se drejtes jane gjera krejt te kunderta aq sa edhe bindja e gjykates po ashtu. Sot, pothuajse pjesa derrmuese e vendimeve gjyqesore bazohen ne aplikimin ose te nenit 59 te Kodit Penal ose te nenit 63 te tij. Aplikimi i nenit 63 duhet pare me me konsiderat e shpesh edhe ne interes gjitheperfshires, jo vetem per individin, por per potencialitetin qe nga parimi i humanizmit a do te kete parandalim te kryerjes se metejshme te vepres penale per autorin nese sistemi gjyqesor tregohet dyfish humanist me te, duke ia konverutar denimin me burgim ne denim alternativ dhe duke mos ia "njollosur" deshmine e penalitetit ? Per sa i takon formave te tjera te denimeve alternative , ato jane pothuajse inekzistente ne aplikim dhe rritja e mases se sanksionit per perfitimin e gjysmelirise nga te denuarit si dhe krijimi i kushteve per te patur burgje gjysme te hapura do t'i sherbente edhe Republikes se Shqiperise ne uljen e kostove financiare per mbajtjen e nje te burgosuri, do t'i sherbente individit, shoqerise dhe familjes se tij. Se fundmi, sigurisht qe denimet alternative jane shume ne proporcion me zhvillimet bashkekohore shoqerore dhe dinamiken e tyre, mirepo asnjehere nuk duhet harruar lufta ndaj kriminalitetit si nje e drejte kolektive, e perbashket dhe komunitare per te qene te te mbrojtur.

Corresponding author: liza.alili@ibu.edu.mk

The shift towards sustainability and an AI-driven economy is changing the context of the labor markets, raising the need for more environmentally sustainable jobs and digital skills in general and in the Western Balkan countries in particular. These developments impose significant demands on universities to adjust their academic programs and learning objectives to meet new labor market demands. The paper investigates how the educational system correlates with the growing requirements of the green labor market in regard to the shift towards sustainable economic development based on AI. The paper considers the growing labor market trends in regard to environmental sustainability and digital transformation and how they affect higher education institutions. The secondary data analysis is used to address the problem statement of the paper. Main sources of information include data gathered by the World Bank. Qualitative research is used to determine main issues related to skills shortages and structural mismatches in the labor market. It turns out that the current higher education systems do not correlate well with the requirements of the labor market in developing countries and transition economies. Main problems include poor relevance of curricula, absence of interdisciplinary studies, lack of cooperation between academia and industries. The main point of the paper is that orientation towards green economy and artificial intelligence in learning programs is crucially important in terms of its impact on the relevance of higher education in modern labor markets. Integrating elements of sustainability and developing skills related to AI will allow university students to be more flexible, creative, and ready for professional work. Moreover, by doing so, higher education institutions will be able to prepare employees who are environmentally friendly and tech-savvy. The study further recommends to pay special attention to the need for the revision of curriculums, integration of green and digital skills into educational programs, as well as the establishment of institutional link aimed at addressing skill gaps.

Key words*: Green economy, labour market, Artificial Intelligence, skills gaps. Study curricula*

Transformimi Digjital dhe Inteligjenca Artificiale: Perspektiva Ekonomike, Juridike dhe Shoqërore

Abstrakt

Shoqëria njerëzore është në zhvillim të vazhdueshëm, e nxitur nga inovacionet që synojnë përmirësimin e jetës së përditshme. Ky studim analizon ndikimin e Inteligjencës Artificiale dhe transformimit digjital në dimensionet juridike dhe psikologjike, me fokus të veçantë në sfidat që lindin nga përdorimi i këtyre teknologjive. Pyetja kryesore kërkimore është: si mund të rregullohet përdorimi i Inteligjencës Artificiale për të garantuar mbrojtjen e të dhënave personale, përgjegjësinë ligjore dhe mirëqenien psikologjike të individëve? Studimi mbështetet në një qasje cilësore, duke përdorur analizë të literaturës dhe intervista me një grup të synuar për të identifikuar ndikimet dhe sfidat kryesore. Gjetjet tregojnë se, ndërsa këto teknologji rrisin efikasitetin dhe lehtësojnë proceset në sektorë të ndryshëm, ato ndikojnë gjithashtu në aspektin psikologjik, duke krijuar varësi nga teknologjia, stres digjital dhe ndryshime në mënyrën e ndërveprimit social. Nga perspektiva juridike, këto teknologji kërkojnë rregullim të qartë për të mbrojtur privatësinë dhe sigurinë e të dhënave personale. Në Shqipëri, progresi në digjitalizimin e shërbimeve publike ka rritur transparencën, por përdorimi i Inteligjencës Artificiale kërkon rregullim më të qartë dhe ndërgjegjësim mbi ndikimet psikologjike. Studimi rekomandon hartimin e kuadrove ligjore të përshtatshme, edukimin digjital dhe psikologjik të përdoruesve, si dhe zhvillimin e politikave që balancojnë përfitimet teknologjike me mirëqenien njerëzore.

Fjalë kyçe:*Inteligjenca Artificiale, Transformimi Digjital, Siguria e të Dhënave, Rregullim Ligjor, Ndikimi Psikologjik*

1. Hyrje

1.1 E drejta e privatësisë dhe mbrojtja e të dhënave personale

Zhvillimi i teknologjisë dhe avancimi i Inteligjencës Artificiale (IA) kanë sjellë ndryshime të thella në funksionimin e shoqërisë moderne, duke ndikuar në komunikim, ekonomi, administratë publike dhe marrëdhënie sociale. Transformimi digjital konsiderohet një nga proceset më të rëndësishme të shekullit XXI, pasi teknologjitë inteligjente po përdoren gjithnjë e më shumë për automatizimin e proceseve dhe përmirësimin e efikasitetit institucional. Sipas European Commission**,** Inteligjenca Artificiale përfshin sisteme që analizojnë mjedisin dhe ndërmarrin veprime autonome për të arritur objektiva të caktuara, duke krijuar mundësi të reja për zhvillim ekonomik dhe shoqëror.

"Ndërsa teknologjia digjitale po bëhet një pjesë gjithnjë e më qendrore e çdo aspekti të jetës së njerëzve, ata duhet të jenë në gjendje t'i besojnë asaj. Besueshmëria është gjithashtu një parakusht për përdorimin dhe pranimin e saj. Kjo përbën një mundësi për Europën, duke pasur parasysh përkushtimin e saj të fortë ndaj vlerave dhe shtetit të së drejtës, si edhe aftësinë e dëshmuar për të ndërtuar produkte dhe shërbime të sigurta, të besueshme dhe të avancuara, që nga energjia, industria automobilistike dhe pajisjet mjekësore (European Commission, 2020)."

"Në epokën digjitale, të dhënat personale janë kthyer në një element me rëndësi strategjike, pasi sistemet inteligjente bazohen në mbledhjen dhe analizimin e sasive të mëdha të informacionit. Të dhënat personale duhet të përpunohen në mënyrë të ligjshme, të drejtë dhe transparente në raport me subjektin e të dhënave (European Union, 2016)." Në nivel europian, General Data Protection Regulation, përbën bazën kryesore juridike për mbrojtjen e të dhënave personale dhe privatësisë së individëve në epokën digjitale. Ky rregullim synon jo vetëm të garantojë sigurinë e informacionit personal, por edhe të rrisë besimin e qytetarëve ndaj teknologjisë dhe shërbimeve online. Në një shoqëri ku njerëzit përdorin çdo ditë platforma digjitale, rrjete sociale dhe shërbime elektronike, mbrojtja e të dhënave personale është bërë një element thelbësor për ruajtjen e dinjitetit, lirisë dhe sigurisë individuale.

Në Shqipëri, procesi i transformimit digjital është zhvilluar ndjeshëm gjatë viteve të fundit, veçanërisht përmes digjitalizimit të shërbimeve publike dhe përdorimit të platformave elektronike si e-Albania. Në aspektin social dhe psikologjik, kjo varësi nga teknologjia mund të ndikojë në ndjesinë e sigurisë dhe besimit të qytetarëve, veçanërisht kur bëhet fjalë për mbrojtjen e të dhënave personale dhe privatësinë online. Frika nga keqpërdorimi i informacionit personal, mungesa e njohurive mbi sigurinë digjitale dhe ndjenja e monitorimit të vazhdueshëm mund të krijojnë pasiguri dhe stres tek përdoruesit. Për këtë arsye, krahas përfitimeve që sjell transformimi digjital, lind nevoja për një mbrojtje më të fortë juridike të të dhënave personale, si dhe për rritjen e ndërgjegjësimit të qytetarëve mbi përdorimin e sigurt dhe të përgjegjshëm të teknologjisë.

Përveç dimensionit juridik, transformimi digjital ka edhe ndikime të rëndësishme psikologjike dhe sociale. Sipas Turkle (2011), teknologjia ka krijuar një realitet ku individët janë vazhdimisht të lidhur virtualisht, por emocionalisht më të izoluar dhe të vetmuar, duke ndikuar në mënyrën se si ata ndërtojnë marrëdhënie dhe përjetojnë ndërveprimin social. Studimi synon të japë rekomandime për krijimin e një kuadri më të qartë rregullator dhe për zhvillimin e politikave që balancojnë inovacionin teknologjik me mbrojtjen e të drejtave dhe mirëqenies njerëzore.

2. Inteligjenca Artificiale dhe Mbrojtja e të Dhënave Personale si Sfida Juridike

Sipas Floridi (2013), etika e informacionit nuk trajton vetëm aspektin teknologjik të Inteligjencës Artificiale, por edhe ndikimin e saj social dhe etik mbi shoqërinë, veçanërisht në lidhje me të drejtat dhe liritë themelore të individit. Në këtë kontekst, përdorimi i sistemeve inteligjente ka ngritur shqetësime në lidhje me privatësinë, diskriminimin algoritmik dhe përgjegjësinë juridike për vendimmarrjen automatike.

Në Shqipëri, mbrojtja e të dhënave personale garantohet nga Ligji Nr. 9887/2008 "Për mbrojtjen e të dhënave personale", i cili përcakton rregullat për përpunimin e ligjshëm të të dhënave dhe mbrojtjen e privatësisë së individëve. Ky ligj synon të garantojë të drejtën e individit për kontroll mbi informacionin personal dhe të mbrojë qytetarët nga përdorimi i paautorizuar i të dhënave të tyre. Gjithashtu, e drejta për mbrojtjen e të dhënave personale mbështetet edhe në Kushtetutën e Republikës së Shqipërisë, e cila garanton mbrojtjen e jetës private dhe dinjitetit të individit (Republic of Albania, 1998). Në këtë kuadër, përpunimi i të dhënave personale duhet të realizohet në përputhje me parimet e ligjshmërisë, drejtësisë dhe respektimit të të drejtave themelore të njeriut, duke garantuar veçanërisht të drejtën e jetës private (Republic of Albania, 2008).

Ky ligj tregon se jo çdo ndërhyrje në të dhënat personale është e paligjshme, për sa kohë ajo kryhet në përputhje me të drejtat themelore të individit dhe respekton jetën e tij private. Në këtë kuadër, subjekti i të dhënave ka të drejtë të mos i nënshtrohet një vendimmarrjeje të bazuar vetëm në përpunim automatik (European Union, 2016, Art. 22). Kjo dispozitë nënkupton se individi ka të drejtë të mos i nënshtrohet vendimeve që merren në mënyrë plotësisht automatike

nga sistemet kompjuterike, përfshirë edhe analizimin ose profilizimin e tij. Në këtë mënyrë, ligji synon të sigurojë që vendimmarrja që ndikon në të drejtat dhe interesat e individit të mos jetë vetëm rezultat i algoritmeve, por të përfshijë edhe kontrollin dhe vlerësimin njerëzor, gjë që është veçanërisht e rëndësishme në përdorimin e Inteligjencës Artificiale. Gjithashtu, në Kushtetutën e Republikës së Shqipërisë përcaktohet se askush nuk mund të detyrohet, përveçse kur e kërkon ligji, të bëjë publike të dhëna që lidhen me personin e tij. Mbledhja, përdorimi dhe bërja publike e të dhënave personale bëhet me pëlqimin e subjektit të të dhënave, me përjashtim të rasteve të parashikuara me ligj. Gjithashtu, çdo individ ka të drejtë të njihet me të dhënat e mbledhura për të, përveç rasteve të parashikuara me ligj (Republic of Albania, 1998, Art. 35). Është shumë e rëndësishme që në këtë proces të zhvillimit të shpejtë digjital të merret parasysh skema e identifikimit elektronik. Skema e identifikimit elektronik siguron një shkallë të lartë besueshmërie për identitetin e pretenduar ose të deklaruar të personit dhe karakterizohet nga specifikime teknike, standarde dhe procedura të lidhura me to, përfshirë kontrolle teknike, të cilat synojnë të ulin rrezikun e keqpërdorimit ose të ndryshimit të identitetit (European Union, 2015).

3. Diskriminimi algoritmik dhe sfidat etike të Inteligjencës Artificiale

3.1 Shkaqet e diskriminimit algoritmik

Një tjetër sfidë e rëndësishme është diskriminimi algoritmik, i cili ndodh kur sistemet e Inteligjencës Artificiale prodhojnë vendime të padrejta si rezultat i të dhënave të njëanshme (biased data). Sipas O'Neil (2016), shumë algoritme funksionojnë si "weapons of math destruction", duke përforcuar pabarazitë sociale dhe duke prodhuar vendime diskriminuese. Në mënyrë të ngjashme, në proceset e rekrutimit të punës, sistemet algoritmike të përzgjedhjes së kandidatëve mund të riprodhojnë stereotipe ekzistuese gjinore ose sociale, duke ndikuar në mënyrë të padukshme në mundësitë e barabarta për punësim. Kjo tregon se teknologjitë e bazuara në Inteligjencën Artificiale mund të ndikojnë drejtpërdrejt në ushtrimin e të drejtave themelore dhe të krijojnë forma të reja të diskriminimit. Në këtë kuadër, parimi i trajtimit të barabartë dhe ndalimi i diskriminimit kërkon që gëzimi i të drejtave dhe lirive të sigurohet pa diskriminim për asnjë arsye, përfshirë seksin, racën, ngjyrën, gjuhën, fenë, mendimin politik ose tjetër, origjinën kombëtare apo sociale, pronën, lindjen ose çdo status tjetër (Council of Europe, 1950, Art. 14). Studimi "Gender Shades" tregon se sistemet komerciale të njohjes faciale kanë nivele më të larta gabimi ndaj grave me ngjyrë të errët, duke dëshmuar ekzistencën e paragjykimeve algoritmike në sistemet e Inteligjencës Artificiale (Buolamwini & Gebru, 2018).

Etika e informacionit trajton ndikimin moral dhe shoqëror të teknologjisë dhe të dhënave në epokën digjitale (Floridi, 2013). Bias algoritmik është një formë paragjykimi që ndodh kur sistemet e Inteligjencës Artificiale prodhojnë vendime të njëanshme, si rezultat i të dhënave të pasakta ose jo përfaqësuese mbi të cilat janë trajnuar.

3.2 Mashtrimi përmes Inteligjencës Artificiale

Zhvillimi i shpejtë i teknologjisë dhe përfshirja e inteligjencës artificiale në jetën e përditshme kanë ndryshuar ndjeshëm edhe mënyrën se si realizohen mashtrimet online. Sulmet kibernetike sot janë shumë më të avancuara, më të besueshme dhe më të vështira për t'u identifikuar.

Ajo që e bën këtë fenomen edhe më shqetësues është fakti se këto aktivitete nuk kryhen rastësisht apo nga individë të izoluar. Shumë prej tyre organizohen nga grupe të strukturuara që funksionojnë me role të ndara dhe me një nivel të lartë koordinimi. Disa merren me krijimin e skemave mashtruese, të tjerë me mbledhjen e të dhënave, ndërsa një pjesë fokusohen te përfitimi financiar. Një problem i madh mbetet mungesa e ndërgjegjësimit për sigurinë digjitale. Edhe organizatat që kanë sisteme të mira mbrojtjeje mund të kompromentohen nëse përdoruesit nuk tregohen të kujdesshëm. Faktori njerëzor vazhdon të jetë pika më e ndjeshme e sigurisë

kibernetike. Një klikim i gabuar, përdorimi i të njëjtit fjalëkalim në disa platforma apo shpërndarja e informacionit të ndjeshëm mund të sjellë pasoja serioze për individët dhe bizneset (Buzra, n.d.). Në të ardhmen, Inteligjenca Artificiale pritet të sofistikojë mashtrimet kibernetike, ndaj mbrojtja duhet të mbështetet si te teknologjia, ashtu edhe te edukimi dhe ndërgjegjësimi.

4. Ndikimet psikologjike të Inteligjencës Artificiale

Ndikimet kryesore psikologjike lidhen ngushtë me ndjenjën e pasigurisë dhe mungesës së kontrollit në mjedisin digjital. Një nga pasojat më të shpeshta është ankthi që krijohet nga ndjesia e monitorimit të vazhdueshëm, si përmes kamerave të mbikëqyrjes, ashtu edhe përmes gjurmimit të aktivitetit online. Kur individët kanë perceptimin se çdo veprim apo informacion personal mund të vëzhgohet dhe regjistrohet, ata mund të përjetojnë stres, pasiguri dhe ndjesi cenueshmërie. Perdoruesit shpesh here perjetojne ankth sepse pasiguria eshte e vazhdueshme ne lidhje me çdo kërkim apo të dhënë personale, në fakt kjo shpesh herë krijon edhe konfuzion për përdorimin e teknologjise. Në të njejtën kohë përdoruesve u duhet të përballojë dy presione psikologjike njëkohësisht në lidhje me përdorimin e teknologjisë, nga njëra anë nevoja për ti përdorur, nga ana tjetër mungesa e kontrollit dhe pasiguria ndaj tyre.

Gjithashtu, përdorimi i të dhënave personale nga algoritmet për reklama të personalizuara apo ndikim në sjelljen e përdoruesve mund të krijojë ndjesinë e humbjes së autonomisë personale. Individët mund të ndihen sikur nuk kanë më kontroll të plotë mbi privatësinë dhe zgjedhjet e tyre, gjë që mund të ndikojë negativisht në gjendjen emocionale. Këto situata shpesh shoqërohen me ankth, mosbesim, shqetësim të vazhdueshëm dhe, në raste të caktuara, edhe me izolim emocional apo simptoma depresive.

Ndikimi në zhvillimin e identitetit: mungesa e privatësisë digjitale mund të pengojë zhvillimin e shëndetshëm të identitetit tek të rinjtë, duke rezultuar në shkallë më të lartë konformiteti, ulje të marrjes së rreziqeve krijuese dhe rritje të frikës nga gjykimi shoqëror. Sjelljet e "paradoksit të privatësisë" tregojnë se përdoruesit shpesh përjetojnë një konflikt midis shqetësimeve për privatësinë dhe sjelljes së tyre reale online, ku pavarësisht këtyre shqetësimeve ata vazhdojnë të ndajnë informacion personal.

Sipas Foucault (1977), koncepti i "Panoptikonit" përshkruan mekanizmin përmes të cilit mbikëqyrja e vazhdueshme ndikon në sjelljen dhe psikologjinë e individit, duke krijuar një formë vetëkontrolli të brendësuar. Në epokën digjitale, kjo logjikë shfaqet përmes monitorimit teknologjik dhe mbledhjes së të dhënave personale, duke gjeneruar një ndjenjë të përhershme vëzhgimi që mund të ndikojë negativisht në lirinë personale dhe mirëqenien psikologjike të individëve. Panoptikoni, fillimisht i konceptuar nga Bentham (1787), ishte një model burgu ku një roje qendrore mund të vëzhgonte të gjithë të burgosurit pa dijeninë e tyre, duke i shtyrë ata të vetëdisiplinoheshin për shkak të pasigurisë së mbikëqyrjes. Foucault e zhvilloi këtë koncept si metaforë të shoqërisë moderne, duke treguar se si format bashkëkohore të mbikëqyrjes, përfshirë kamerat, internetin dhe rrjetet sociale, ndikojnë në mënyrën se si individët sillen dhe ndërveprojnë në jetën e përditshme.

Sipas Freud (1926), ankthi shfaqet si një reagim psikologjik ndaj ndjenjës së pasigurisë dhe mungesës së kontrollit. Në këtë kuadër, në kontekstin e teknologjisë digjitale dhe mbikëqyrjes online, individi mund të përjetojë shqetësim psikologjik si pasojë e frikës nga cenimi i privatësisë dhe keqpërdorimi i të dhënave personale. Lidhja e ankthit me pasigurinë është një nga lidhjet më relevante, që sundon më pas mendjen e personit. Frika se mund të publikohen të dhënat apo mund te vëzhgohen krijon sjellje te shpërqendruara dhe mungese të vëmendjes për përditshmërinë në vazhdim. Prandaj kjo mungesë sigurie krijon ankth të vazhdueshëm duke ndikuar në cilësine e jetës.

5-Metodologjia

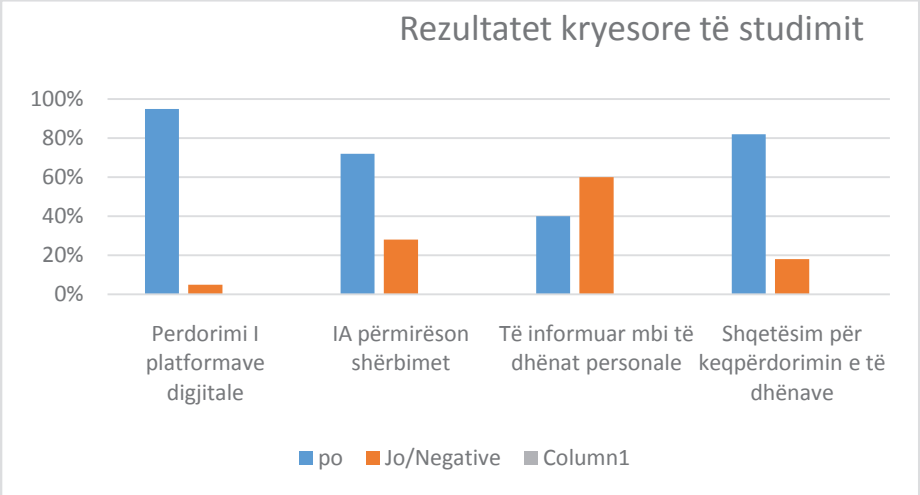
Ky studim është mbështetur në një qasje të përzier, cilësore dhe sasiore, duke përdorur analizën e literaturës dhe pyetësorin si instrument kërkimor. Pyetësori u plotësua nga 100 pjesëmarrës të grupmoshës 18–35 vjeç. Të dhënat u mblodhën në mënyrë elektronike dhe u analizuan për të identifikuar perceptimet mbi Inteligjencën Artificiale, privatësinë dhe ndikimet psikologjike të teknologjisë. Mostra përbëhej kryesisht nga studentë të Fakultetit të Drejtësisë, Shkencave Sociale dhe Gjuhëve të Huaja, si dhe nga individë të përzgjedhur në mënyrë rastësore.

5.1-Analiza Sasiore e Rezultateve

Rezultatet e analizës sasiore tregojnë një nivel shumë të lartë të përfshirjes së individëve në mjedisin digjital, duke konfirmuar varësinë e shoqërisë moderne nga teknologjia dhe shërbimet online. Shumica e të anketuarve e perceptojnë Inteligjencën Artificiale si një zhvillim pozitiv, i cili rrit efikasitetin dhe lehtëson aksesin në shërbime.

Gjithashtu, rezultatet tregojnë se një pjesë e konsiderueshme e qytetarëve nuk kanë njohuri të plota mbi mënyrën e përdorimit të të dhënave personale, duke evidentuar nevojën për edukim më të madh digjital dhe juridik. Kjo lidhet me një nivel relativisht të ulët besimi ndaj sigurisë së të dhënave personale dhe institucioneve që i administrojnë ato.

Shumica e të anketuarve raportojnë se kanë përjetuar ndjesinë e mbikëqyrjes gjatë përdorimit të internetit dhe rrjeteve sociale, çka reflekton shqetësimet mbi privatësinë dhe kontrollin e të dhënave personale. Rezultatet evidentojnë gjithashtu perceptimin e fortë të lidhjes midis përdorimit të tepërt të teknologjisë dhe problemeve psikologjike si stresi, ankthi dhe lodhja mendore.



Në tërësi, gjetjet tregojnë se shumica e të anketuarve mbështesin nevojën për një kuadër juridik më të qartë dhe më të fortë për përdorimin e Inteligjencës Artificiale dhe për mbrojtjen e privatësisë.

5.2-Analiza Cilësore e Rezultateve

Analiza e përgjithshme e pyetësorit tregon se transformimi digjital dhe Inteligjenca Artificiale perceptohen si zhvillime të rëndësishme dhe të dobishme për shoqërinë, veçanërisht në rritjen e efikasitetit dhe lehtësimin e shërbimeve publike dhe private. Megjithatë, krahas përfitimeve teknologjike, të anketuarit shfaqin shqetësime të konsiderueshme në lidhje me privatësinë, mbrojtjen e të dhënave personale dhe ndikimin psikologjik të teknologjisë.

Një nga elementet më të theksuara është ndjenja e pasigurisë dhe e mbikëqyrjes në mjedisin online. Shumë individë shprehen se përdorimi i vazhdueshëm i rrjeteve sociale dhe platformave

digjitale krijon stres, lodhje mendore dhe ankth lidhur me mundësinë e keqpërdorimit të të dhënave personale. Kjo lidhet drejtpërdrejt me perceptimin e mungesës së kontrollit mbi informacionin personal dhe me frikën nga cenimi i privatësisë.

Nga aspekti juridik, rezultatet tregojnë se qytetarët kanë nevojë për më shumë garanci ligjore dhe transparencë në përdorimin e Inteligjencës Artificiale. Shumica e të anketuarve mbështesin krijimin e ligjeve më të forta për mbrojtjen e të dhënave personale dhe kontrollin e sistemeve automatike të vendimmarrjes.

Në aspektin psikologjik, rezultatet evidentojnë se ekspozimi i vazhdueshëm ndaj teknologjisë dhe ndjenja e mbikëqyrjes ndikojnë negativisht në mirëqenien emocionale të individëve, duke krijuar ankth, stres dhe ulje të ndjesisë së sigurisë personale.

Konkluzione

Transformimi digjital dhe zhvillimi i Inteligjencës Artificiale përfaqësojnë një nga ndryshimet më të thella të shoqërisë moderne, duke ndikuar jo vetëm në ekonomi dhe administratë, por edhe në mënyrën se si individët mendojnë, komunikojnë dhe ndërtojnë marrëdhënie sociale. Studimi tregon se teknologjia ka sjellë përfitime të rëndësishme në rritjen e efikasitetit, lehtësimin e shërbimeve dhe përshpejtimin e proceseve institucionale, veçanërisht përmes digjitalizimit të shërbimeve publike.

Nga perspektiva juridike, evidentohet nevoja për një kuadër më të qartë dhe më specifik rregullator për përdorimin e Inteligjencës Artificiale, sidomos në lidhje me përpunimin e të dhënave personale, përgjegjësinë ligjore dhe vendimmarrjen automatike. Në kushtet kur algoritmet ndikojnë gjithnjë e më shumë në jetën e individëve, mbrojtja e të drejtave themelore kërkon përshtatje të vazhdueshme me zhvillimet teknologjike.

Në aspektin psikologjik, studimi evidenton se përdorimi i vazhdueshëm i teknologjisë mund të shoqërohet me stres, ankth, lodhje mendore dhe ndjesi izolimi social. Pavarësisht se teknologjia rrit lidhshmërinë mes individëve, ajo njëkohësisht mund të krijojë edhe distancë emocionale dhe pasiguri në raport me privatësinë dhe kontrollin e të dhënave personale.

Në përfundim, sfida kryesore e epokës digjitale nuk lidhet vetëm me zhvillimin teknologjik, por me krijimin e një ekuilibri të qëndrueshëm midis inovacionit, mbrojtjes së të drejtave themelore dhe mirëqenies psikologjike të individit.

Rekomandime

Bazuar në gjetjet e studimit, rekomandohen këto masa:

1. **Hartimi i një kuadri më të qartë ligjor për Inteligjencën Artificiale** – Është e nevojshme zhvillimi i politikave dhe rregullimeve specifike që përcaktojnë përgjegjësinë juridike për përdorimin e Inteligjencës Artificiale, veçanërisht në proceset e vendimmarrjes automatike dhe përpunimit të të dhënave personale.
2. **Forcimi i mbrojtjes së të dhënave personale** – Institucionet publike dhe private duhet të garantojnë standarde më të larta të sigurisë kibernetike dhe transparencës në përdorimin e informacionit personal, në përputhje me standardet europiane të privatësisë.
3. **Edukimi digjital dhe ndërgjegjësimi qytetar** – Duhet të zhvillohen programe edukimi mbi sigurinë digjitale, mbrojtjen e privatësisë dhe përdorimin e sigurt të teknologjisë, veçanërisht për të rinjtë dhe grupet më të ekspozuara ndaj mjedisit online.

4. **Përfshirja e dimensionit psikologjik në politikat digjitale** – Politikat publike mbi transformimin digjital duhet të marrin në konsideratë ndikimin psikologjik të teknologjisë, duke promovuar mirëqenien mendore dhe balancën midis jetës reale dhe asaj virtuale.
5. **Kontroll njerëzor mbi sistemet inteligjente** – Vendimmarrja që ndikon drejtpërdrejt në të drejtat dhe jetën e individëve nuk duhet të mbështetet vetëm në algoritme, por duhet të përfshijë gjithmonë mbikëqyrje dhe përgjegjësi njerëzore.
6. **Nxitja e etikës në zhvillimin teknologjik** – Zhvillimi i Inteligjencës Artificiale duhet të udhëhiqet jo vetëm nga efikasiteti ekonomik, por edhe nga parimet etike, dinjiteti njerëzor dhe respektimi i lirive themelore.
7. **Krijimi i një kulture të "humanizmit digjital"** – Shoqëria moderne duhet të ndërtojë një marrëdhënie më të balancuar me teknologjinë, ku progresi digjital nuk zbeh komunikimin njerëzor, empatinë dhe lirinë individuale. Teknologjia duhet të shërbejë për zhvillimin e njeriut, pa cenuar identitetin dhe dimensionin e tij emocional.

Abstract

Recently, more and more activities and areas in them are being transferred to the digital space. Companies that want to remain modern and competitive should also follow current trends and adapt to them as quickly as possible. One of the progressive directions of change is digital business transformation. On the one hand, this allows for fast and unified process management, timely availability, and sharing of necessary information; on the other hand, it allows for saving human and material resources and moving more steadily towards sustainability. Dental clinics are no exception. The aim of the study - to analyze the progress of digitalization in the private dental clinic and provide recommendations for achieving digital maturity. The article discusses the digital transformation process and its course, important prerequisites that need to be considered when digitally transforming a company, analyzes the digitalization progress of the private dental clinic and its possible strategic steps towards digital maturity. The results of the study showed that the level of digital maturity of KOS Dental Clinic has already reached an average level and clear opportunities for improvement can be seen. In order to accelerate the digital transformation, a multifaceted approach is important - to use additional investments in digital technologies and employee skills improvement, which should be clearly planned and properly managed, as well as it would be useful to have a comprehensive strategy that includes data security and the implementation of ICT technologies, which create greater data analytics capabilities and allow for decision-making at a higher level and help the company to conduct its activities more sustainably.

Keywords: Digital Transformation, Digital Maturity, Technological Change, Innovative Dentistry, Digital Dentistry.

1. Introduction

Recently, more and more activities and areas in them are being transferred to the digital space. Companies that want to remain modern and competitive should also follow current trends and adapt to them as quickly as possible. The modern business context is characterized by extremely high overall uncertainty, the speed of technological development and changing consumer needs, making digital transformation a necessity rather than a considered option. On the one hand, this allows for fast and unified process management, timely availability, and sharing of necessary information; on the other hand, it allows for saving human and material resources and moving more steadily towards sustainability.

Digital transformation (hereinafter referred to as DT) is the integration of digital technologies into all areas of business, fundamentally changing the way company operates and creates value for customers. It is also cultural change that requires organizations to constantly face challenges,

experiment, and seek for innovative solutions (Remeikienė et al, 2023). Therefore, a fundamental review of the entire organizational processes is necessary - the business model, culture, experience, and reorganization using digital technologies. So, DT today is not just a fashionable concept or choice, it is one of the essential conditions for a company to survive and be competitive. Dental clinics are no exception.

The aim of the study - to analyze the progress of digitalization in the private dental clinic and provide recommendations for achieving digital maturity.

Research methods used: in order to identify the directions of DT, an analysis of scientific literature and resources was conducted; to assess the analysis of the digitalization situation of private dental clinic, an interview was conducted with company representatives; a structured assessment questionnaire was used to evaluate digital maturity; a SWOT analysis was used to identify the company's key strengths, internal limitations, potential growth and development opportunities, and external threats; a case analysis method was used to identify DT opportunities.

2. Theoretical framework

2.1. Concept of Digital Transformation

DT has shifted from just a technical upgrade to a core business strategy that reimagines value delivery across all sectors (Splunk, 2025). Unlike "digitization", which is converting analog data to digital, or "digitalization", which involves using digital technology to enhance existing processes, DT signifies a comprehensive shift in organizational culture and management strategies (Lozic, Fotova Čikovic, 2024). By 2026, it is characterized by the adoption of disruptive technologies such as Artificial Intelligence (AI) and cloud-first architectures to transform operating models and improve decision-making systems (Nasscom, 2026).

The analysis of information sources allowed to determine that the main characteristics of DT can be distinguished:

- **Customer-Centricity:** Redesigning the client's treatment journey to make it more personalized and seamless (Splunk, 2025);
- **Operational Agility**: Leveraging cloud and multi-cloud computing frameworks for flexible and scalable operations (Nasscom, 2026);
- **Data-Driven Governance**: Using real-time analytics to move from reactive to proactive decision-making (Splunk, 2025);
- **Human-Machine Coexistence**: Approaching the "10-20-70" rule, which holds that a company should dedicate 10% of its effort to algorithms, 20% to technology and data, and the remaining 70% to people and processes (Afkhami et al., 2026).

2.2. Digital Transformation in Dental Clinics

DT in healthcare means integrating to make care more reliable, affordable, accessible (Nevina Infolech, 2026). Today, modern healthcare institutions are transforming patient care by integrating Ambient Intelligence into many areas of their operations. This technology concept is used for early diagnostics and patient flow management. It also allows for improved diagnostic accuracy using clinical data interpretation, personalized treatment planning and coordinated care. Remote patient monitoring and ongoing care using smart devices are also being developed. In the

areas of administration, billing and optimization of operational processes AI is also applied. As a result, costs decrease, operational efficiency increases, and patients are provided with faster and higher quality healthcare services (Terveystalo, 2026). Dental clinics are no exception.

DT is profoundly changing dental clinics by incorporating cutting-edge digital technologies into their clinical, administrative, and laboratory workflows. The DT of dental clinics has evolved from basic record digitization to developing a highly inter-connected ecosystem where AI and automated manufacturing technologies function as "virtual coworkers" (Top Digital Dental Trends…, 2026). According to the Digital Dentistry Market Report (2026), "the digital dentistry market size has grown rapidly in recent years. It will grow from $6.79 billion in 2025 to $7.57 billion in 2026 at a compound annual growth rate (CAGR) of 11.4%". The growth during the historic period can be credited to the expansion of private dental clinics, increase in dental care procedures, higher demand for precise diagnostics, greater awareness of advanced dental treatments, and improved access to dental technologies. In 2026, modern clinics is being driven by digital technologies that assist throughout the entire treatment process, from diagnosis to the final restoration:

- **3D Intraoral Scanners (IOS)**: Now regarded as the "standard care", IOS penetration has surpassed 60% in key markets (Top Digital Dental Trends…, 2026). These devices remove the need for physical impressions, offering precise 3D models and true color images to monitoring issues such as tooth wear and gingival inflammation (Luke & Rezallah, 2025);
- **Diagnostic AI**: AI platforms currently automatically identify bone loss, caries, and periapical lesions on radiographs with an accuracy rate of 80-92% (Luke & Rezallah, 2025);
- **Additive & Subtractive Manufacturing:** 3D printers now outperform milling machines in the U.S. clinics, allowing for chairside fabrication of surgical guides, crowns, and aligners within a single visit (Top Digital Dental Trends…, 2026);
- **Cloud-Based Ecosystems:** Various cloud-based Practice Management Systems (PMS) facilitate smooth data sharing between clinics and laboratories (Top Digital Dental Trends…, 2026) and Customer Relationship Management (CRM) Systems. These systems enhance communication, decrease administrative tasks, and enable quicker and more accurate treatment workflows.

Digital technologies enhance both clinical and administrative workflows. Regarding the effect on clinical workflows, digital tools have transformed dentistry towards "Same-Day Dentistry". AI-powered CAD systems can save 30-45 minutes per procedure and cut down remakes by about 18% (Migliorati et al., 2025). Moreover, guided implant surgery utilizing CBCT and digital guides enhances precision to within 1 mm and decreases surgical time by up to 20% (Luke & Rezallah, 2025). AI Receptionists and Smart Scheduling are reducing the administrative burden. AI-agents manage natural-language patient interactions, schedule appointments, and automatically update patients charts in the PMS (Top Digital Dental Trends…, 2026). Furthermore, predictive analytics systems examine patient behaviour and appointment history to enhance scheduling, minimize "empty chair" periods, and better manage staff workload, and facilitate automated follow-ups, recall campaigns, as well as real-time performance monitoring (Practice by Numbers, 2026). In summary, the mentioned digital technologies enable dental staff to concentrate more on treatment quality and patient care.

While DT offers significant benefits to dental clinics, its implementation also comes with a number of financial, organizational, and operational challenges. One of the most important issues is system interoperability, as many digital solutions, AI platforms, and legacy information systems still cannot exchange data quickly and efficiently enough. This makes it more difficult for organizations to create a fully integrated digital system (Top Digital Digital Dental Trends ..., 2026). In addition, as the application of AI technologies expands, the risk of cybersecurity threats also increases. Dental clinics are increasingly becoming targets of AI-based phishing attacks and ransomware. Hackers use generative AI to imitate the writing style of doctors or impersonate trusted service providers in order to steal confidential patient data. Another important issue is the stability of the infrastructure, as many dental clinics still rely on outdated local networks or wireless networks that struggle to process large-scale 3D images and cloud-based electronic health record systems. This can lead to system failures and slowdowns during patient treatment (Schultz Technology, 2026). Finally, as managers and medical professionals tend to prefer gradual technological adoption over sudden and radical changes, organizational resistance to change remains a significant challenge. This caution is largely driven by concerns about potential impact on doctor-patient relationships and daily work routines (Cozmescu, 2026).

2.3. Prerequisites for Digital Transformation

As can be seen from the increasingly digital environment and various information sources, the DT of dental clinics is already becoming an absolute necessity in providing healthcare services, and not just a considered option. Most advanced clinics around the world are trying to join the transformation flow as quickly as possible. As highlighted by Fortune Business Insights (2026), the global digital dentistry market will reach 5.47 billion US dollars in 2026, and this is closely related to the ever-increasing need for accuracy and efficiency in providing care. While there is a clear need for DT, it is not a simple and self-evident process. Successful transformation depends on five key prerequisites - technological readiness, human resources, organizational readiness, financial capabilities, and regulatory compliance (Figure 1).

Figure 1. 5 key prerequisites of successful DT

Technological readiness is the foundation of DT. It is based on the idea of moving from analog to digital workflow. Currently, one of the most important tools used in everyday clinical practice is 3D intraoral scanners, which allow reducing accuracy errors by up to 30% CAD/CAM systems can achieve up to 95% accuracy in crown fabrication (Elmadani et al., 2025). Modern preparedness also includes AI-based diagnostics that can show the degree and location of tooth decay for earlier diagnoses with sufficient accuracy, allowing for earlier identification of problems than with traditional methods (Weiss, 2025). "3D printing can create digital prosthetics that fit comfortably without the need for lengthy wait times, which normally exist when an outside dental lab is used to craft materials" (Weiss, 2025). Efficient clinics are moving to cloud-based software and using open API standards to ensure fast, timely and seamless data exchange between the clinic and the laboratory (Schultz Technology, 2026). When reviewing scientific resources, it could be identified key trends in DT. For companies to operate smoothly in today's remote work environment, process automation using machine learning, artificial intelligence, big data, and other data analytics technologies has become the new norm standard (Hess et al, 2016; Tang, 2021). The ability to gather and merge customer data from various sources enables companies to develop more precise customer profiles, enhance audience segmentation, and improve predictive models (Guarda et al, 2021). The more digital a company becomes, the higher risk of cyberattacks. To prevent this, companies must implement cybersecurity systems (Lysenko et al, 2025). The company's capacity to adapt and efficiently oversee increasingly complex infrastructure, such as cloud architecture and automation software, is also particularly important (Hess et al, 2016).

The "human element" is often one of the biggest obstacles to DT. The mere acquisition of innovative technologies will not automatically change the previous established practices in the clinic; the working team must be able to manage those technological tools. According to Elmadani et al. (2025), about 70% of dentists themselves indicate that they need extensive intensive specialized training to master new digital tools. The need for psychological resilience is also highlighted. Digital changes in the clinic can cause significant psychological stress for employees, so a support system is necessary to manage the learning curve and prevent burnout on the path of DT (Elmadani et al., 2025). Thus, a modern human resource management strategy involves building a team that can successfully use AI for patient planning, engagement, and service delivery, thereby starting to demand more than basic clinical skills from employees.

From an organizational perspective, both structural and cultural changes are needed. First, clinics need to move from paper-based to paperless workflows, which includes automated billing and electronic radiology (Weiss, 2025). As the number of dental service organizations continues to grow, local digital infrastructure is increasingly being standardized. This is to ensure consistent quality of care. Organizational readiness also includes a close alignment of company goals with patient expectations for short wait times and same-day restoration services (Fortune Business Insights, 2026).

Another important prerequisite is financial capabilities. One of the main problems for small businesses remains the high cost of initial investments. Fully-fledged CAD/CAM systems typically cost 90-112 thousand dollars (Fortune Business Insights, 2026). Initial financial readiness allows small clinics to invest primarily in 3D printing and guided implant surgery tools, which dominate the current market segment due to the high return on investment in patient outcomes (Fortune Business Insights, 2026). The digital dental tools market is expected

to grow at an annual growth rate of 11.4% in 2026, so clinics must have liquid capital or financial structures in order not to experience technological obsolescence (Digital Dentistry Market Report, 2026).

The DT of a clinic is no less influenced by various regulating external factors - data security, interoperability standards, and the ethics of using AI. The most important priorities in this area are data security and various privacy standards. In the European Union, the application of Regulation (EU) 2016/679, i.e. the General Data Protection Regulation (GDPR) (*General Data Protection Regulation (GDPR)*, 2018), is very important in healthcare institutions, as it ensures the security and confidentiality of patients' personal and health data, and protects their right to privacy. This becomes especially important if clinics are trying to adapt cloud systems or platforms (Elmadani et al., 2025). For example, the American Dental Association (ADA) is currently working to develop unified interoperability standards for dental images, which will oblige clinics to use certified, open-standard software (Beaumont et al., 2025). Other countries are also adopting similar regulations. Another pressing issue in today's digital society is the ethical use of AI. In dentistry, compliance applies to the ethical use of AI diagnostics, ensuring clarity and transparency when generating a treatment plan. The general use of AI is also regulated by the Artificial Intelligence Act, Regulation (EU) 2024/1689, which establishes harmonised rules on artificial intelligence, and clinics must also follow it (*Regulation - EU - 2024/1689 - EN - EUR-Lex (Artificial Intelligence Act)*, 2024). Thus, ethical diagnosis means a balance between technological accuracy, combined with patient privacy, human clinical judgment and fairness (Khoury et al., 2025).

The successful DT of a company requires the involvement and cooperation of all stakeholders - managers, employees, customers and regulators (Konopik, Blunck, 2023). In summary, only by ensuring technological readiness, organizational flexibility, competent human resources, sufficient financial capacity and compliance with regulatory requirements can sustainable DT results be achieved. The totality of these factors forms the basis for the effective implementation of digital changes and the long-term competitiveness of the company.

2.4. Strategic Directions for Digital Transformation

In scientific literature sources examining the DT process, different authors distinguish different stages (steps) of transformation: Harris (2022) distinguishes 7 steps of DT - Understand Current Processes, Create an Evaluation Team, Know Your Requirements, Select a Platform or Solution, Implement, Train and Communicate, Measure Results; Fischer, Goertler, Rennert (2024) enriched and distinguished these stages of DT - Initiate, Analyze, Debate, Act, Evaluate the change; Zaoui, Souissi (2020) in their scientific work summarized 31 research and white papers where describes stages of DT implementation. Every company is unique, with different needs, so it is important to create a customized strategy that meets its specific goals and circumstances.

Summarizing the steps provided by different authors, the authors of this article chose to use 5 steps of DT cycle - Assessment of the current situation, Strategy development, Selection and application of suitable technologies, Monitoring and evaluation, Further development (Figure 2).

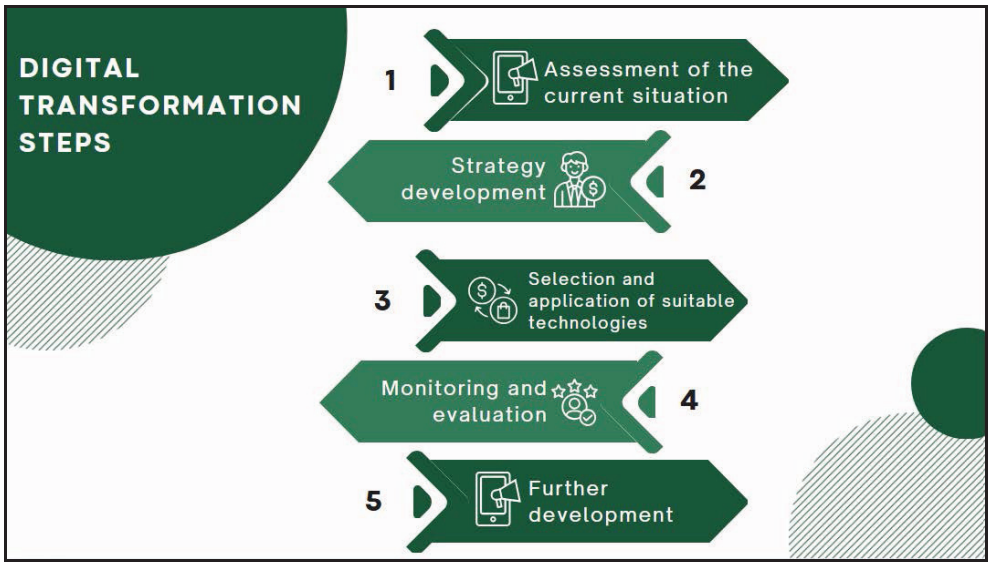

Figure 2. 5 steps of DT cycle

The following article discusses the implementation of the first two steps - Assessment of the current situation and Strategy development.

3. Methodology of Empirical Research

To assess the prerequisites for DT of KOS Dental Clinic, an empirical methodology was developed. The methods used:

- **Case Study.** The research employed a case study approach to deeply analyze DT within a specific organization. KOS Dental Clinic was chosen as the case to assess its digital maturity and identify potential opportunities for further digital evolution;
- **Open Digital Maturity Assessment (DMA) Methodology.** To assess the level of digital maturity of KOS Dental Clinic across various areas of activity and identify key improvement opportunities, the Open Digital Maturity Assessment (DMA) tool developed by the European Digital Innovation Hubs Network was used (Digital Maturity Assessment Tool, n.d.);
- **SWOT Analysis.** To identify the company's key strengths, internal limitations, potential growth and development opportunities, and external threats, a SWOT analysis was performed;
- **Data collection and Analysis Methodology.** The study used both quantitative and qualitative data collected using DMA assessment methodology, internal company documents, and an assessment of digital processes and technological solutions used in the dental clinic. The information obtained was analyzed and systematized using descriptive analysis principles, and results were interpreted based on the theoretical provisions of DT.

4. Evaluation of Digital Transformation Readiness at KOS Dental Clinic

4.1. Case Study of KOS Dental Clinic

KOS Dental Clinic is a private dental services company located in Utena, a city in eastern Lithuania with a population of about 25 thousand. The clinic has been operating since 1991 and provides a wide range of dental services - from therapeutic treatment of dental implantation and prosthetics services. KOS Dental Clinic employs 8 qualified and attentive specialists with many years of professional experience, which ensures high-quality services to patients. The company also has a loyal customer base and good reputation in the market, which reflects a high level of patient satisfaction. After the change of owners of the dental clinic four years ago, greater attention and financial resources were directed to improving the efficiency of operational processes by implementing modern digital solutions.

The digital solutions currently used in the company were evaluated in the main areas of activity: patient flow management, financial and document administration, billing management, diagnostics and treatment planning processes, provision of treatment services, and communication (Figure 3).

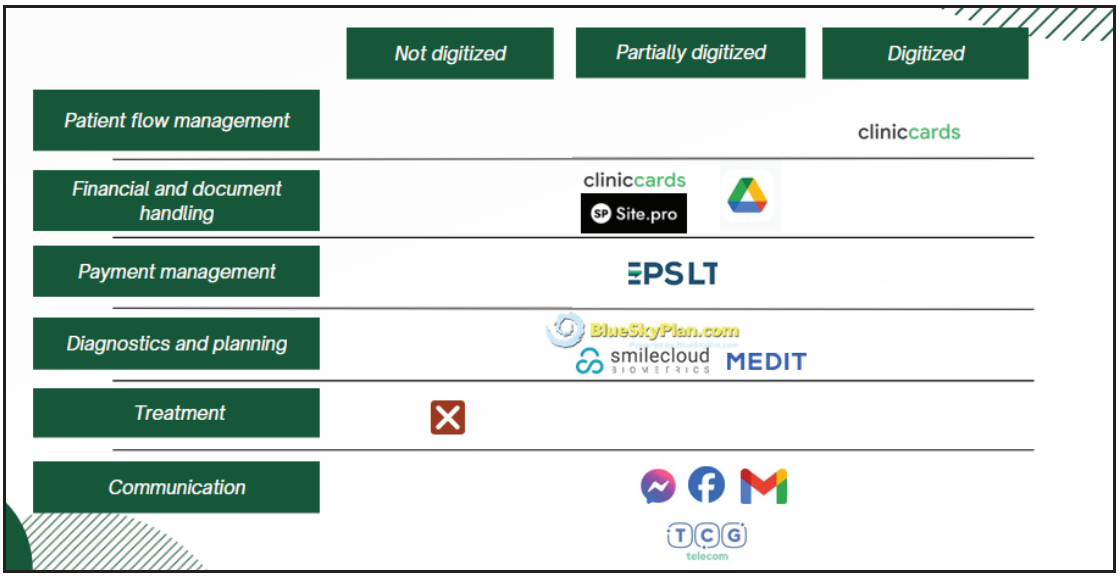

Figure 3. Existing Digital Solutions at KOS Dental Clinic

Patient flows and some financial information are managed at KOS Dental Clinic using a specialized cloud-based CRM software "Cliniccards" developed for dental clinics. It allows dental professionals not only to schedule patient visits, but also to monitor patient finances, create treatment plans, generate activity reports, salary breakdowns, and store high-quality photos. It is also worth mentioning that currently the capabilities of this software are not fully utilized in the clinic due to a lack of human resources. In order to enter large amounts of information, for example, about available and used medical supplies, an additional employee is required.

The clinic uses the "EPS One" smart cash register-reader to manage payments. This all-in-one Point of Sale (POS) system integrates a cash register, bank payment acceptance functionality,

cash transactions, receipt printer and internet connection. It is important to note that the "EPS One" POS system automatically transmits daily payment information directly to the State Tax Inspectorate. Unfortunately, there is currently no option to automatically synchronize payments and receipts between the POS system and a CRM system being used - payment amounts must be entered manually into the cash register-reader. When it comes to financial accounting, KOS Dental Clinic uses the cloud-based Enterprise Resource Planning (ERP) and Accounting system "Site.pro". Using artificial intelligence, this ERP system provides the ability to recognize invoices, as well as maintain payroll and personnel records, monitor warehouse balances, and provide reports to managers.

The dental clinic uses several advanced digital dental technologies for diagnostics and planning. The Medit i700 Intraoral scanner allows for the capture of precise, full-color 3D digital impressions of a patient's teeth and gums. Once the scan is complete, the 3D file is sent directly to the dental laboratory, where crowns, veneers and bridges can be fabricated. KOS Dental Clinic also uses Smilecloud software to provide patients with a visual preview of how their teeth will look after treatment. These digital technologies ensure a more efficient dental practice and a smoother experience for patients.

KOS Dental Clinic uses the social network Facebook, as well as e-mail, to communicate with current and potential patients. Clients are informed about successful visit registration by SMS, and reminders about the upcoming visit are sent automatically the day before. The client, having received the SMS, can confirm their visit or cancel it using the link sent, then this information immediately appears in "Cliniccards". It is worth mentioning that the current dental clinic website does not yet provide the ability for patients to register for an appointment themselves.

4.2. Assessment of Digital Transformation Readiness at KOS Dental Clinic

4.2.1. Assessment of Digital Maturity

In order to assess the level of digital maturity of KOS Dental clinics, a digital maturity assessment questionnaire was used. The assessment data shows that the company's maturity level reaches 45%, i.e. it is classified as an average level. Such an assessment reveals that KOS Dental Clinic already applies and implements certain digital solutions, but the level of digitalization in the company still has significant potential for improvement. The indicator was determined by completing a digital maturity assessment questionnaire and assessing six aspects: 1) digital activity strategy, 2) digital readiness, 3) human-centered digitalization, 4) data management, 5) automation and intellectualization, 6) green digitalization. The diagram below reflects the results of the company's digital maturity assessment according to these areas (Figure 4).

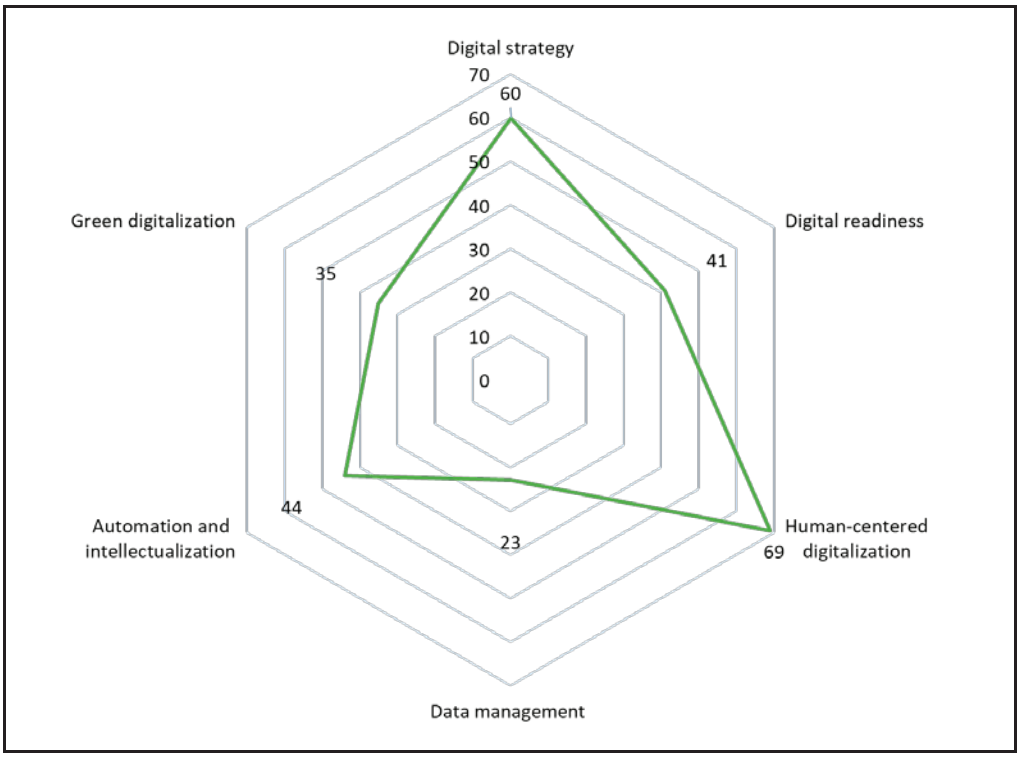

Figure 4. KOS Dental Clinic digital maturity assessment results by areas of activity

The results of the assessment reveal that the company's digitalization level is not the same in different areas of activity: the highest scores are in the areas of Human-centered digitalization (69%) and Digital strategy (60%), while the lowest level of digitalization is in the area of data management (23%). The level of digital maturity of the remaining dimensions is assessed as average: Digital readiness - 41%, Automation and intellectualization - 44%, Green digitalization (35%).

The Human-centered digitalization area assesses whether employees are empowered and skilled in using digital technologies. It also assesses how digital technologies help improve work skills, increase employee engagement and empowerment, and improve their working conditions to increase productivity and well-being.

The assessment of the digital strategy area allowed us to clarify the overall state of the digitalization strategy in the company from an operational perspective. The company's investments in digitalization in various areas of activity were assessed, as well as the company's readiness to implement digitalization, which may require unforeseen organizational and economic resources.

The data management and connectivity aspect included storing data digitally, organizing it within the company, accessing it across all connected devices (computers, etc.), and using it for operational purposes, while applying cybersecurity schemes to ensure sufficient data protection.

Digital readiness allowed authors to see the extent to which the company is currently using digital technologies - both basic and more innovative, advanced ones. The assessment included communication infrastructure (high-speed Internet, cloud computing services, remote access to office systems), company website, online forms and blogs, customer contact forums, live chat, social networks and chatbots for customer contact, e-commerce, e-commerce promotion, e-

government (online communication with government institutions, including public procurement), remote work collaboration tools (e.g. remote working platform, video conferencing, virtual learning, tools related to specific company activities), intranet, information management systems (enterprise resource planning, product lifecycle management, customer relationship management, supply chain management, e-invoicing). The use of advanced digital technologies was also assessed - modeling and digital twins (i.e. real-time digital images of physical objects/processes), virtual reality, augmented reality, computer-aided design (CAD) and manufacturing (CAM), production management systems, Internet of Things, blockchain technologies, additive manufacturing (e.g. 3D printer).

When assessing the Automation and intellectualization aspect, the level of automation and intellectualization is determined, which is helped by digital tools integrated into business processes. The Automation and intellectualization aspect measures the level of automation and intellectualization that digital tools integrated into business processes help to ensure. These tools include natural language processing, including chatbots, text mining, machine learning, sentiment analysis, computer vision, image recognition, audio processing, speech recognition, processing and synthesis, robotics and autonomous devices, business data analytics, data analytics, decision support systems, recommender systems, and intelligent control systems.

The assessment of the green digitalization area included the company's ability to implement digitalization in a long-term approach that takes responsibility for and cares for the protection and sustainability of natural resources and the environment (ultimately gaining a competitive advantage as a result).

4.2.2. SWOT Analysis of Digital Transformation

Based on digital maturity evaluation results and in order to identify the main development opportunities in the context of digitalization, a SWOT analysis of the KOS Dental Clinic was conducted (Figure 5).

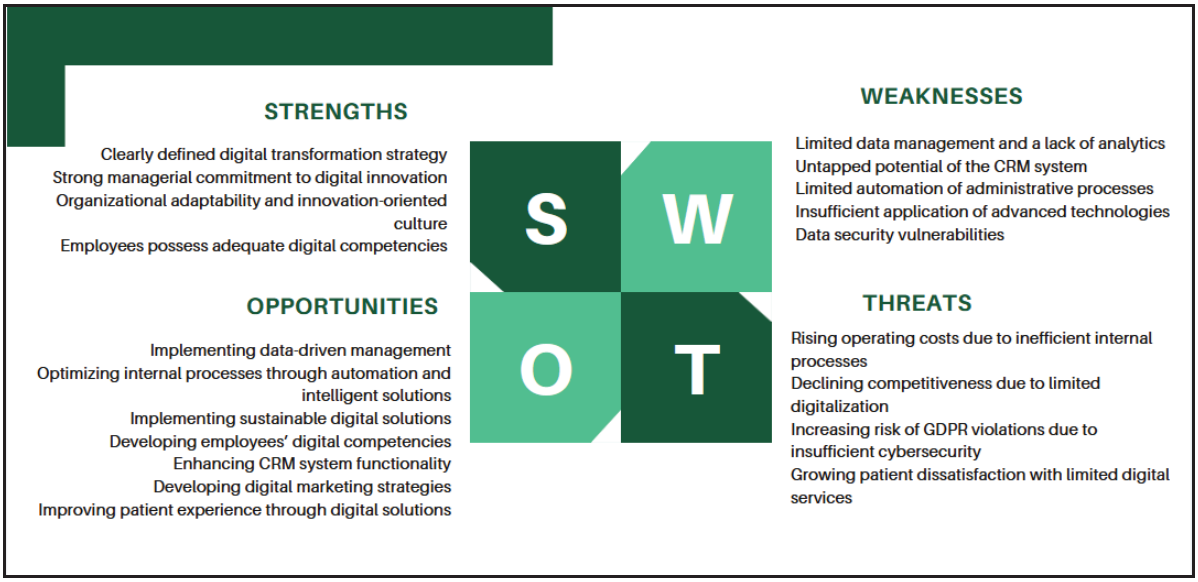

Figure 5. Results of SWOT analysis of KOS Dental Clinic

The strengths identified during the SWOT analysis reveal the main internal advantages of the KOS Dental Clinic related to digitalization processes, which create the prerequisites for increasing operational efficiency and successfully operating in a competitive environment. One of the main strengths of the company is a clear direction of the digital activity strategy, adherence to which ensures consistent integration of technologies into operational processes and rapid adaptation to market changes. The strategic approach of the company's management to digitalization, organizational flexibility and openness to innovations, together with a sufficient level of digital competencies of employees, allows the KOS Dental Clinic to rapidly implement new technologies. The identified strengths show that the company has favorable assumptions for the development of digitalization. Nevertheless, the SWOT analysis also revealed significant weak areas.

The results of the KOS Dental Clinic's digital maturity assessment revealed that the company is at a very early stage of data management (use, organization, storage, access and security) development. The currently available CRM system is used fragmentarily, i.e. The system performs the basic functions of patient registration and medical information storage, but is not sufficiently applied to data collection and analytics, increasing patient loyalty and sales. The company faces challenges in the areas of administrative process automation and application of advanced technologies, which may reduce the efficiency of the organization's activities. It is also noticeable that only basic level cybersecurity measures are applied in the company, but there is a lack of a clear data security plan, and the cyber threat management process is not sufficiently developed. The identified weaknesses together allow us to predict further directions for the development of the company's DT.

The DT of a dental clinic lays the groundwork for more efficient organization of activities by implementing data-driven management, automating internal processes, and deploying smart technology solutions. Developing digital systems improves service quality, optimizes patient data management, and increases operational efficiency while reducing administrative costs and resource use. A significant opportunity also lies in strengthening employees' digital competencies, which enables more effective use of technology in daily activities. In addition, expanding the functionality of CRM systems and using digital marketing tools can help strengthen relationships with existing patients, attract new customers, and improve the overall patient experience when using digital services.

A significant threat to the DT process of a dental clinic is rising operating costs and the need to continually invest in technological infrastructure, the rapid aging of which reduces the long-term effectiveness of those investments. Insufficient optimization of internal processes, limited investments in digital solutions, and a lack of digital competencies among employees can reduce the competitiveness of the organization and slow the implementation of innovations. Other notable risks include system failures, dependence on IT suppliers, and cybersecurity gaps, which increase the likelihood of GDPR violations and the loss of patient data. As patient demand for fast, convenient and modern services increases, insufficiently developed digital services can lead to patient dissatisfaction and a decreasing attractiveness of the clinic in the market.

4.3. Digital Transformation of Dental Clinic Processes

Following an analysis of the company's digital maturity and utilizing Nyctelius (2020) treatment process flowchart for dental clinics, this article's authors created a framework for the DT of dental clinic processes (Figure 6). The framework highlights how digital technologies are integrated into key stages of dental service delivery: patient administration, clinic management, diagnostics, planning, treatment and aftercare processes. The model demonstrates that DT in dentistry involves not only just adopting individual technologies but also systematically integrating digital solutions across the entire patient service cycle.

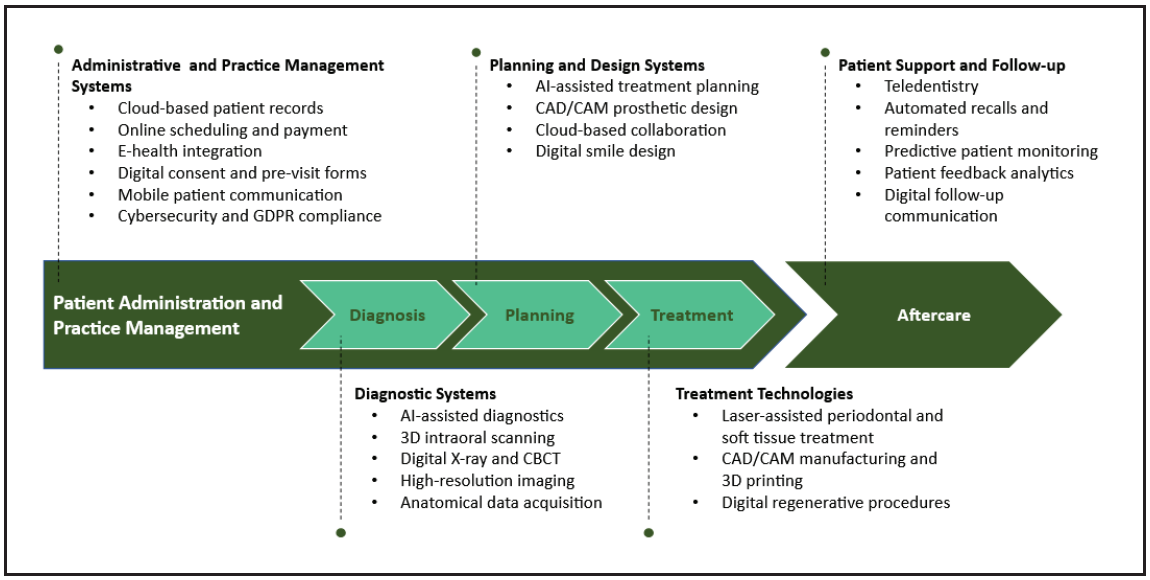

Figure 6. Digital Transformation Framework for Dental Clinic Processes

At the patient administration and clinic management stage, digital technologies provide the prerequisites for smoother clinic work: cloud-based patient systems, online registration and payment options, integration with e-health platforms, digital consent procedures, mobile communication with patients and cybersecurity measures along with GDPR compliance measures are used. These solutions enhance operational efficiency. improve data accessibility and ensure more secure handling of patient information. The diagnostic stage emphasizes the role of artificial intelligence-driven diagnostic tools, 3D intraoral scanning, digital X-ray, and CBCT technologies, along with high-resolution imaging and anatomical data gathering. Combining these technologies enables more precise diagnoses, improved visualization of oral structures, and facilitates simplified clinical decision-making. In the planning stage, AI-driven treatment planning tools, CAD/CAM prosthetic design systems, cloud collaboration, and digital smile modeling facilitate personalized care and smoother teamwork among specialists. These innovations enhance treatment precision and ensure more reliable results. The importance of laser technologies, CAD/CAM manufacturing, 3D printing and digital regenerative procedures is emphasized in the treatment stage. These solutions allow to increase the accuracy of treatment, reduce the duration of procedures and improve the quality of dental services. During the postoperative care phase, teledentistry tools, automated reminder, predictive monitoring, patient feedback analysis, and ongoing digital communication are essential. They help maintain long-term patient engagement and ensure continuous care.

Based on an analysis of KOS Dental Clinic's current digital tools and clinic management's budget constraints, short-term and long-term directions for technology implementation were identified. In the short term, the dental clinic should focus on adopting digital technologies that require minimal investment. This approach can enhance administrative efficiency, boost patient service quality, and increase overall operational performance. It is recommended to prioritize implementing an online patient registration system, digital consent forms, digital marketing and CRM solutions, and teledentistry for remote consultations. The integration of these technologies would allow optimizing patient administration processes, improving communication with patients, increasing the availability of services and strengthening the clinic's competitiveness in the market.

In the long run, the dental clinic should concentrate on adopting more advanced and investment-heavy digital technologies to enhance diagnostic accuracy, improve treatment quality, and boost operational efficiency. Implementing artificial intelligence-based diagnostic and treatment planning systems, along with 3D intraoral scanning, CAD/CAM solutions, 3D printing, and advanced patient data analysis, is highly recommended. Integrating these technologies would enable more personalized treatments, streamline process management, and improve service quality.

5. Conclusions

The results of the study showed that the level of digital maturity of KOS Dental Clinic has already reached an average level and clear opportunities for improvement can be seen. The company would benefit from additional investments in digital technologies and skills in order to improve business processes and move to more advanced solutions and intelligent technologies.

To accelerate the digital transformation, clearly planned and properly managed digital skills training for employees should be provided. It should also be provided with the necessary incentives so that employees are fully involved and support the implementation of new digital solutions without fear of the associated changes.

A significant part of the information in the company is already being digitized, but it would be useful to have a comprehensive strategy that includes data security and the implementation of ICT technologies. This would create greater data analytics capabilities, which would allow for decision-making at a higher level and help the company to conduct its activities more sustainably.

Implementation Barriers of Agile Methods in SMEs: A PRISMA-Documented Bibliometric Analysis of the Current State of Research (2020–2025)

Daniel Pfennig - 1

Zuzana Skorková - 2

Bratislava University of Economics and Business, Dolnozemská cesta 1, 852 35 Bratislava, Slovakia, contact: zuzana.skorkova@euba.sk , ORCID: 0000-0002-4828-2188

Abstract

Agile methods are considered a promising approach for enhancing the organizational agility and competitiveness of small and medium-sized enterprises (SMEs). However, their practical implementation frequently fails due to specific barriers that have not yet been sufficiently systematized in the scientific literature. This study aims to map the current state of research on implementation barriers of agile methods in SMEs and to identify existing research gaps. The central research question is: Which implementation barriers of agile methods in SMEs are identified in the scientific literature (2020–2025), and how has research on this topic evolved? Methodologically, the study is based on a PRISMA-documented literature search in Web of Science (2020–2025), from which 144 peer-reviewed articles were included in the bibliometric analysis using Biblioshiny after systematic screening. The results reveal a significant increase in research activity from 2022 onwards, peaking in 2024/2025. The co-occurrence network identifies four thematic clusters, with implementation and organizational agility forming the core cluster. The thematic map classifies challenges as a central yet scientifically underdeveloped basic theme, while digital transformation and dynamic capabilities emerge as growing research priorities. The strong fragmentation of the field – both in terms of authors and publication sources – confirms the early stage of development of this research domain. The findings provide practice-relevant insights for SMEs and highlight concrete research gaps, particularly regarding the role of management in agile transformation processes and the scalability of agile methods in non-IT sectors.

Keywords: Agile Methods, SME, Implementation Barriers, Bibliometric Analysis, Organizational Agility

JEL classification*:* 033

1. Introduction

In view of the increasing pressure caused by digitalization, globalization and dynamic market changes, agile methods are considered the central answer to the challenges of modern corporate management in small and medium-sized enterprises (SMEs). The progressive spread of Industry 4.0 technologies – from networked production systems to data-driven business models to cloud-based collaboration platforms – is fundamentally changing the competitive conditions for SMEs (Nunez-Merino et al., 2020). Empirical studies show that agile approaches can significantly increase the responsiveness, innovative strength and competitiveness of SMEs (Reischl et al., 2022). SMEs represent the majority of all enterprises in most economies and represent a significant share of employment and economic value added. At the same time, they are structurally different from large companies: they typically have flatter hierarchies, more limited resources, closer customer relationships and a greater dependence on key people. These structural features can act as both an advantage and an obstacle to the adoption of agile methodologies. In particular, organizational agility – understood as the ability to react quickly

and flexibly to environmental changes – is considered in the literature to be a central success factor for SMEs in the context of Industry 4.0 (Mrugalska & Ahmed, 2021).

Despite the proven potential of agile methods, SMEs often fail to successfully implement them in practice. The barriers are heterogeneous and highly contextual, with organizational, cultural, and resource-related factors playing a central role (Mishra et al., 2021; Flores-Cerna et al., 2022). Agile methodologies were originally designed for software development projects and are enshrined in the Agile Manifesto of 2001. Their transfer to other areas of the company, and in particular to the specific contextual conditions of SMEs, requires considerable adaptation, which has so far been insufficiently systematised in the scientific literature. In this context, Zasa et al. (2020) show that hybrid organizational models – which combine agile and traditional project management approaches – represent a promising but prerequisite transitional form for SMEs. Digital transformation further intensifies this pressure to adapt: Wang et al. (2020) show that a company's IT capabilities and its digital business strategy are critical to whether agile practices can be successfully integrated into existing organizational structures.

While research on agile methodologies has grown significantly in recent years, there is a lack of a systematic overview of the barriers to implementation for the current period 2020–2025. In particular, the topic of "challenges" remains scientifically underdeveloped and is classified as a basic theme in thematic network analyses (Mollet et al., 2023; Dal Fabbro et al., 2025). The wave of digitalization, accelerated by the COVID-19 pandemic and the increasing adoption of Industry 4.0 technologies, has increased the pressure on SMEs to adopt agile practices. At the same time, the barriers to implementation have changed and new challenges in the field of remote work, digital collaboration tools and hybrid organizational models have emerged.

The present study aims to close this research gap by means of a PRISMA-documented bibliometric analysis based on the Web of Science database. The bibliometric method has proven to be an established tool for the systematic mapping of scientific research fields and enables the objective identification of trends, thematic clusters and research gaps (Donthu et al., 2021). In contrast to narrative reviews, bibliometric analysis enables a quantitatively sound inventory of the research field, which is supplemented by visualizations such as thematic maps, co-occurrence networks and trend-topic analyses. The study addresses the following research question:

RQ1: What are the barriers to implementation of agile methods in SMEs identified in the scientific literature (2020–2025) and how has research on this topic developed?

Body of Manuscript

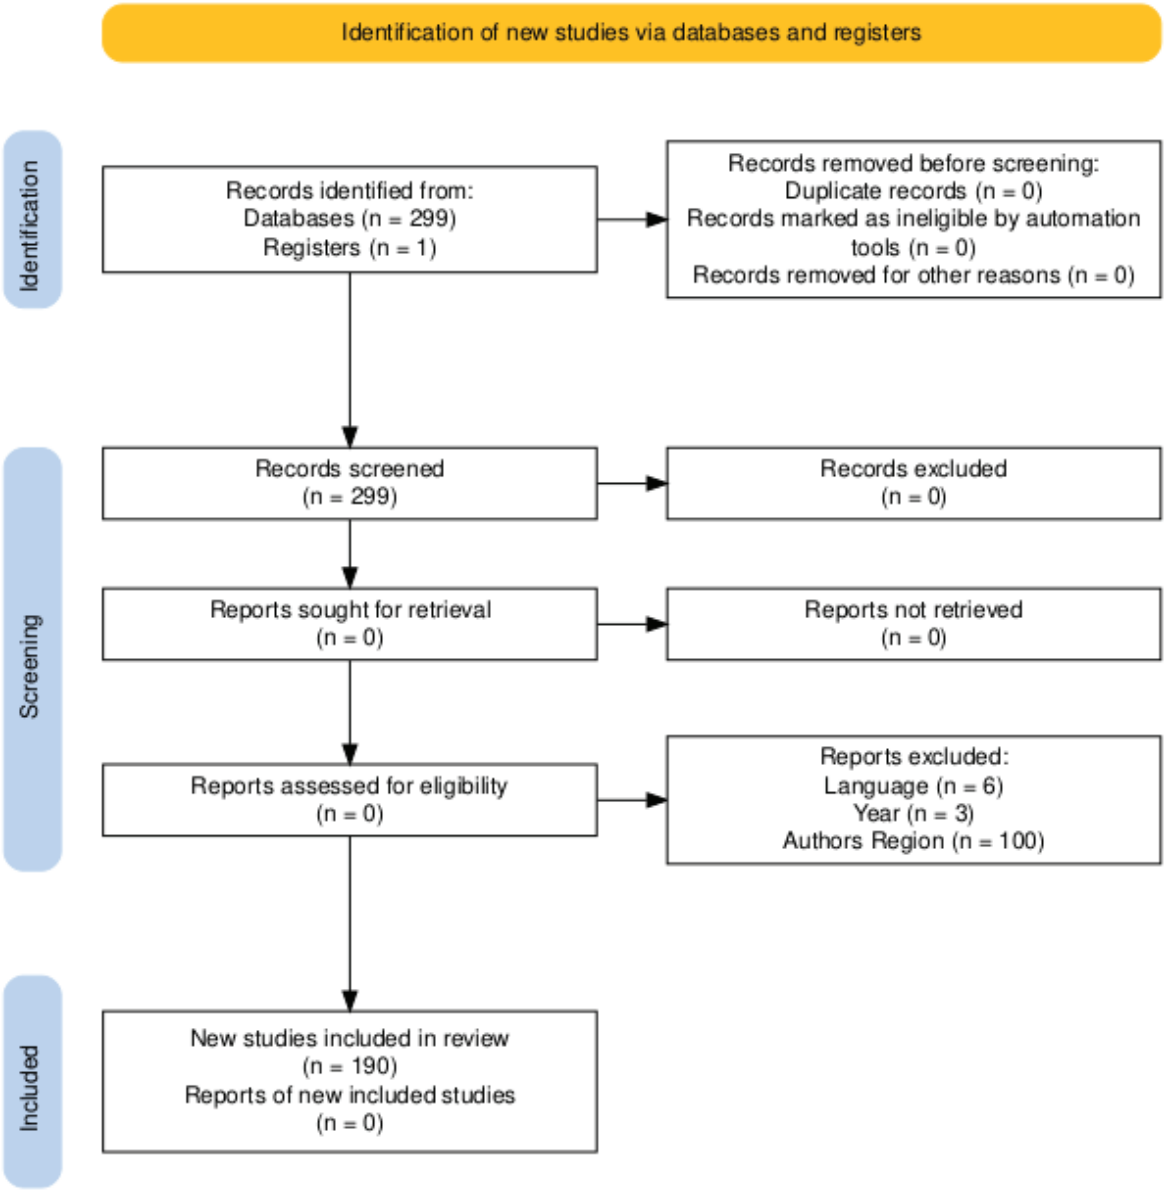
1.1 Methodik

The Web of Science database was chosen as the database for bibliometric analysis because it offers a wide coverage of high-quality, peer-reviewed publications in the field of management and business and is considered one of the leading scientific databases. In contrast to other databases such as Scopus or Google Scholar, Web of Science is characterized by strict quality criteria in indexing, which increases the reliability of the results. The search strategy combined three thematic blocks using Boolean operators:

The first block covered terms related to agile methodologies: "agile method", "agile management", "agile practice", "agile adoption", "agile implementation", "agile transformation", "organizational agility", "business agility", "scrum", "kanban". The second block focused on the SME context: "SME", "small and medium", "small business", "medium-sized enterprise", "family business", "manufacturing", "production", "industrial", "non-software", "Mittelstand". The third block addressed implementation barriers: "barrier", "obstacle", "challenge", "impediment", "resistance", "failure", "difficulty", "difficulties", "constraint", "hinder", "limitation".

The analysis period was limited to 2020 to 2025 in order to reflect current developments and ensure relevance for current practice. The initial search query yielded 299 hits from databases and one entry from registers (total: n = 300). Duplicate entries, records flagged by automation tools, and records removed for other reasons were all n = 0, leaving 299 records for screening. As part of the eligibility screening, articles were reviewed based on defined exclusion criteria: Six articles were excluded based on language (n = 6), three on the basis of the publication period (year, n = 3) and 100 on the basis of the author region (n = 100). The final dataset comprised N=190 peer-reviewed articles that were included in the bibliometric analysis. This selection process was documented in accordance with the PRISMA 2020 standard (Page et al., 2021) and is visualized in Figure 1.

Figure 1: PRISMA 2020 Flow Diagram – Documentation of the study selection process (identification, screening, inclusion).



Source: Own processing - Haddaway, N. R., Page, M. J., Pritchard, C. C., & McGuinness, L. A. (2022). doi.org/10.1002/cl2.1230

Table 1 provides an overview of the main characteristics of the final dataset. The dataset includes 190 documents from 150 sources (journals, books, etc.) in the period 2020–2025, with a compound annual growth rate of 11.24%. The average document age is 3.21 years, and the average citation rate is 10.83 citations per document. The dataset contains 812 author keywords (DE) and 373 keywords plus (ID), which reflects the thematic breadth of the field. A total of 721 authors are represented, 13 of whom are individual authors. The average co-authorship is 4.04 authors per document, with an international co-authorship rate of 36.84%. The document types primarily include articles (n = 106), conference papers (n = 67), reviews (n = 10) and early access articles (n = 7).

Table 1: Main information

Description	**Results**
MAIN INFORMATION ABOUT DATA	
Timespan	2020:2025

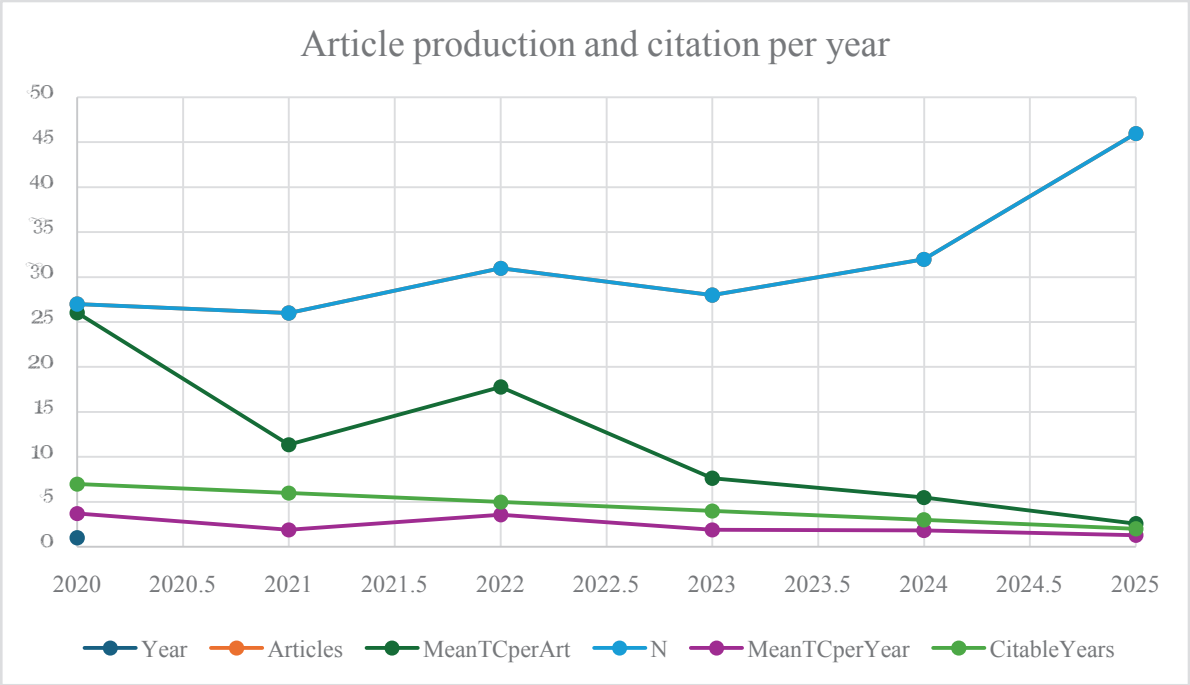
The bibliometric analysis was performed using Biblioshiny, an R package of the bibliometrix framework (Aria & Cuccurullo, 2017). Donthu et al. (2021) describe bibliometric analysis as a method that makes it possible to systematically evaluate large amounts of scientific literature, map research structures, and track the intellectual development of a field – characteristics that make them particularly suitable for the present study of a still young field of research. The bibliometrix framework offers a variety of analysis methods for this purpose, which include both descriptive statistics and complex network analyses. Applied methods included citation analysis, keyword co-occurrence networks, thematic maps, trend-topic analyses and word clouds. The analysis aimed to identify thematic clusters, to record research trends and to systematically identify central barriers to the implementation of agile methods in SMEs.

The Thematic Map is based on the science mapping approach developed by Cobo et al. (2011), which classifies research topics based on two dimensions: Degree Centrality measures the importance of a topic for the entire research field, while Density represents the internal state of development of a topic cluster. Themes with high centrality and high density are classified as motor themes – they are both well-developed and central to the field. Topics with high centrality but low density are considered basic themes: they are relevant, but scientifically underdeveloped and thus represent potential research gaps (Cobo et al., 2011). This classification enables a systematic assessment of the state of development of individual research topics. The co-occurrence network also visualizes the frequency of the common occurrence of keywords in scientific articles and enables the identification of thematic clusters as well as central concepts in the research field.

2. Results

Figure 2 shows the annual article production and citation development in the period 2020 to 2025 as a combined line chart with six metrics. The cumulative number of articles (N, blue) is rising continuously from about 27 in 2020 to around 46 in 2025, which impressively demonstrates the growing research interest in the subject of investigation. The increase is not linear, but has particularly pronounced growth phases in 2022 and 2024–2025. The average citation rate per article (MeanTCperArt, dark green) shows an opposite trend: it starts in 2020 at a high level of about 26 citations per article and drops to about 3 by 2025. This decline is methodologically expected and can be explained by the time effect – older articles had more time to accumulate citations, while younger publications are still at the beginning of their citation cycle. The average citation rate per year (MeanTCperYear, purple) remains at a low level of between 1 and 4 over the entire period, which reflects the still low reception density of the research field. CitableYears (light green) decrease from about 7 (2020) to about 2 (2025), as expected as newer articles have fewer citable years. Overall, the figure shows a dynamically growing field of research, but still young in terms of scientific reception, which has an annual growth rate of 11.24%.

Figure 2: Annual Scientific Production and Citations



Source: Own processing following extracted data from Biblioshiny

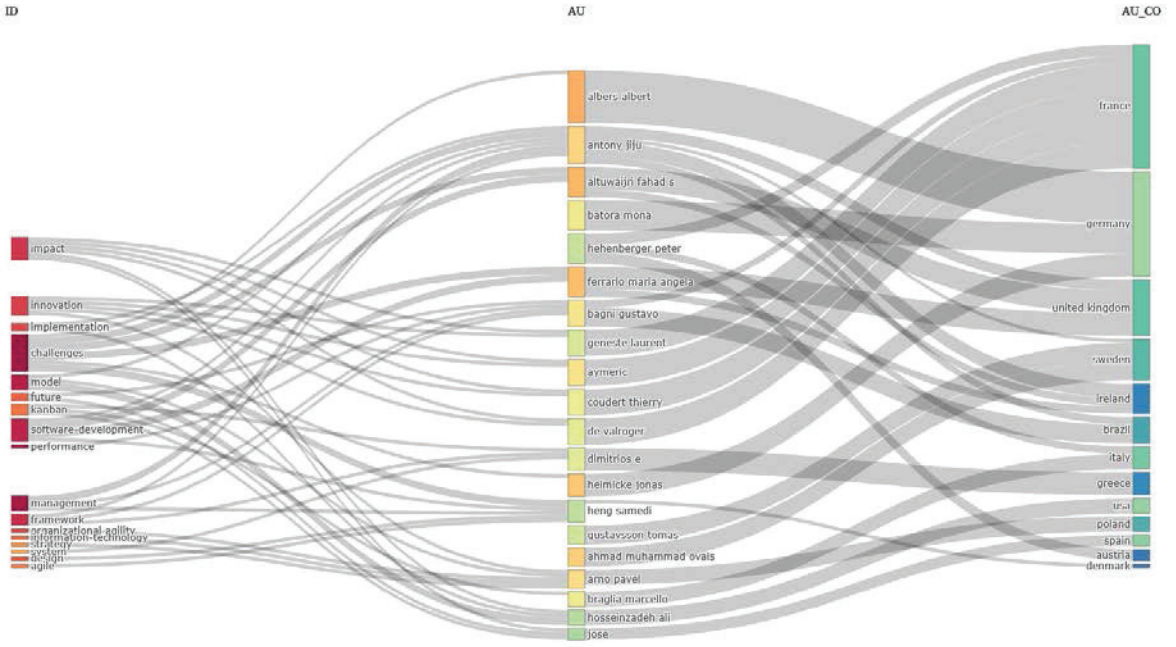
Figure 3 shows the Three-Field Plot (Sankey Chart), which visualizes the relationships between three central bibliometric fields: the keywords (ID, left field), the authors (AU, middle field), and the authors' countries (AU_CO, right field). The connecting lines between the fields represent the frequency of co-occurrence of keywords, authors, and countries in the dataset; a wider connecting line indicates a stronger association (Aria & Cuccurullo, 2017).

In the left-hand field, the keywords "challenges", "innovation" and "implementation" dominate as the most prominent terms, followed by "impact", "model", "performance", "management", "framework", "organizational agility", "information-technology", "strategy", "system", "kanban", "software-development", "future", "agile" and "design". The prominent position of "challenges" as the most common keyword in the dataset confirms the research gap identified in the thematic map: Implementation barriers represent the most discussed, but at the same time scientifically underdeveloped topic in the research field. The presence of "kanban" and "software-development" as specific keywords suggests that part of the dataset explicitly focuses on agile development methods, while the majority of the literature addresses more general management concepts.

The middle field shows a pronounced fragmentation of authorship: more than 20 authors are represented, including Albers Albert, Altuwaijri Fahad S, Ferrario Maria Angela and Heimicke Jonas, without a broad dominance of individual authors being discernible. This observation corresponds to the findings from the author analysis (Figure 11), according to which Albers Albert is considered the most published author with five publications, while the majority of the authors have contributed only two articles. The lack of focus on a few leading authors underlines the decentralized and fragmented nature of the field of research, which is typical of emerging research areas and makes it difficult to develop coherent research programs (Donthu et al., 2021).

The right-hand field shows a clear European dominance of the research landscape: France forms the largest country block, followed by Germany (Germany), the United Kingdom (United Kingdom), Sweden (Sweden), Ireland (Ireland), Brazil (Brazil), Italy (Italy) (Greece), the USA (Poland), Spain (Spain), Austria (Austria) and Denmark (Denmark). The concentration on European countries, especially France and Germany, suggests a strong regional research perspective. This geographical distribution is significant in terms of content, as European SME structures have specific regulatory and economic framework conditions that can limit the transferability of the findings to other regions. The connections between the keywords "challenges" and "implementation" on the one hand and the European countries on the other make it clear that barriers to implementation are primarily addressed in the European research context, which underlines the need for a stronger international perspective.

Figure 3: Three-Field Plot Results



Source: Own processing using Biblioshiny

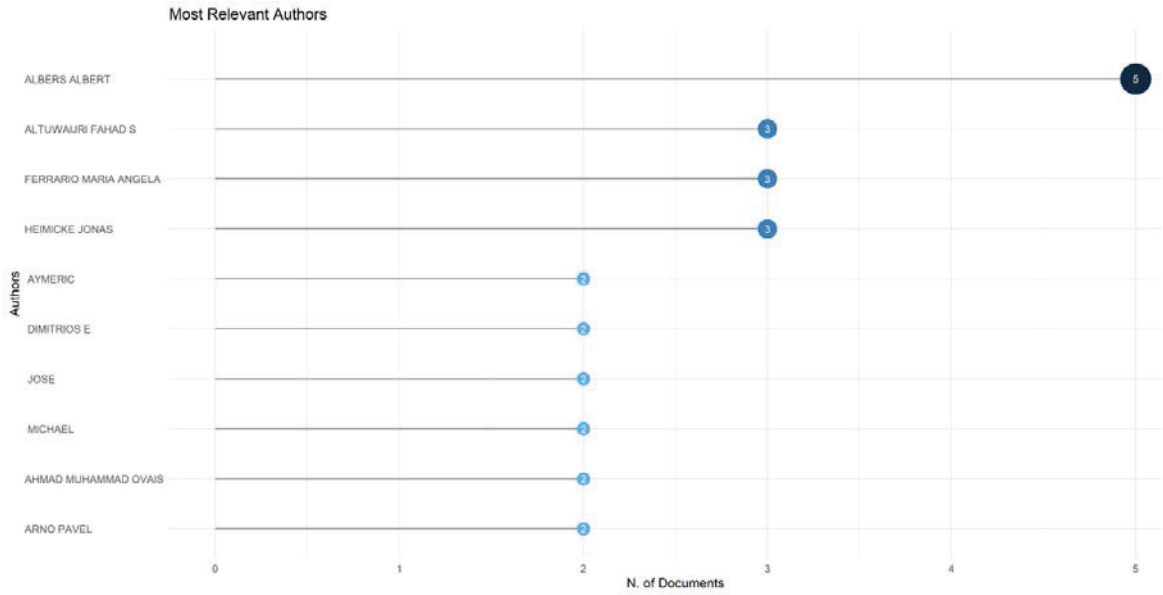
Table 2 shows the most publishing authors in the dataset as a lollipop chart, in which the horizontal axis shows the number of documents (N. of Documents) and the vertical axis the author names. The point size is proportional to the number of publications. A total of ten authors are presented who have contributed at least two articles to the dataset.

Albers Albert leads by a clear margin with 5 articles and thus occupies an outstanding, if not dominating, position in the field of research. Altuwaijri Fahad S, Ferrario Maria Angela and Heimicke Jonas follow in second place with 3 articles each. A second group of authors – Aymeric, Dimitrios E, Jose, Michael, Ahmad Muhammad Ovais and Arno Pavel – contributed 2 articles each.

This distribution shows that although individual authors show a certain activity in the research field, there is no established research group with a critical mass of publications. The maximum author presence of five articles is a clear indication of the relative immaturity of the field compared to mature fields of research, in which leading authors often have ten or more

publications. The field of research is young and decentralized, which is typical for emerging research areas (Donthu et al., 2021). The lack of concentration on a few leading authors makes it difficult to develop coherent research programs and the systematic accumulation of knowledge about implementation barriers of agile methods in SMEs – and thus underlines the need for increased international collaboration to consolidate the field.

Table 2: Most relevant authors



Source: Own processing using Biblioshiny

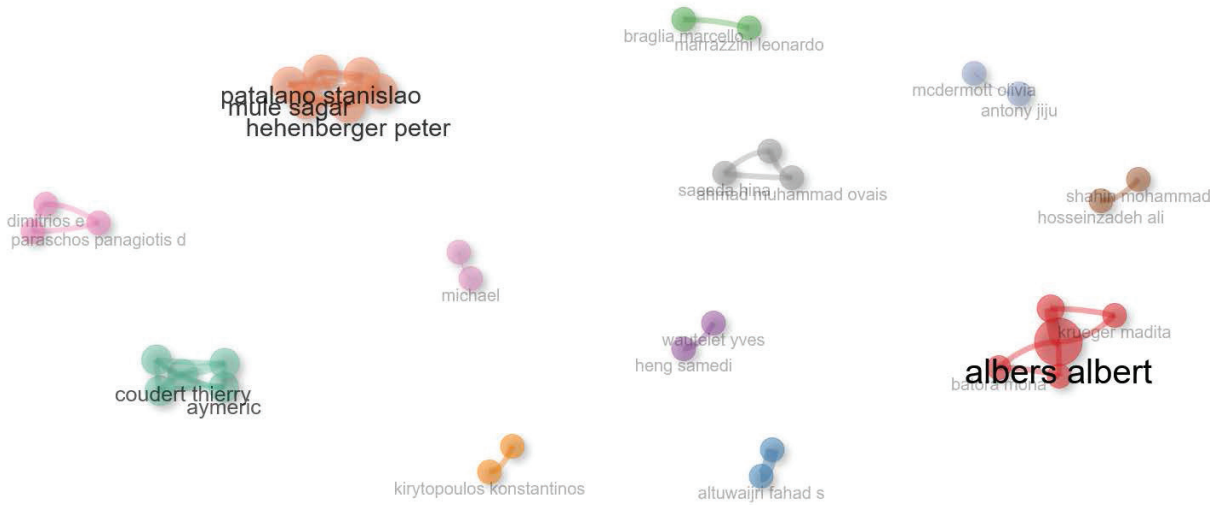
Figure 4 shows the Collaboration Network at the level of affiliations (author cooperations), which visualizes the institutional cooperation structures in the field of research. Each node represents an author; the size of the node corresponds to the number of its publications in the dataset, and connecting lines between nodes indicate common publications.

The network is highly fragmented and consists of several small clusters isolated from each other with no overarching connections. The largest and most prominent node is Albers Albert (red cluster), who forms a closely networked research group together with Krueger Madita and Batora Mona. Albers Albert's node size reflects his leading publication activity with five articles in the dataset and confirms the findings from the author analysis. The orange cluster includes Patalano Stanislao, Mule Sagar and Hehenberger Peter as the second largest cooperation group. Other identifiable clusters are: Coudert Thierry and Aymeric (turquoise), Braglia Marcello and Marrazzini Leonardo (green), Saeed Hina and Ahmad Muhammad Ovais (grey), Antony Jiju and McDermott Olivia (purple), Wautelet Yves and Heng Samedi (purple), Dimitrios E and Paraschos Panagiotis D (pink) as well as Shahin Mohammad and Hosseinzadeh Ali (brown). Altuwaijri Fahad S (blue) and Kirytopoulos Konstantinos (orange) each form small clusters of two, while Michael appears as an isolated node with no cooperative connections.

The pronounced fragmentation of the network, with many small, isolated clusters without bridging connections, is a central finding: there are no overarching collaboration networks that would connect different research groups. This confirms the decentralization of the research field identified in the authors' analysis and indicates that the scientific examination of implementation barriers of agile methods in SMEs has so far taken place in largely unconnected research islands. The lack of hub authors who act as bridges between different clusters

complicates knowledge transfer between research groups and the emergence of a coherent research discourse (Donthu et al., 2021).

Figure 4: Collaboration Network (Affiliations)



Source: Own processing using Biblioshiny

Table 3 lists the ten most cited countries in the dataset by Total Citations (TC) and average citations per article. Spain leads by a clear margin with 405 TC with an average of 25.30 citations per article and thus occupies a top position in both absolute and relative citation values. Germany follows in second place with 233 TC (Ø 9.00), just ahead of China with 211 TC – with China having the second highest relative citation rate with an average of 52.80 citations per article, indicating particularly influential individual publications. Portugal (150 TC, Ø 15.00) and Poland (145 TC, Ø 14.50) are in fourth and fifth place.

India is particularly noteworthy with 142 TC and the highest average value of 71.00 citations per article in the entire ranking. This value exceeds the second-placed average (China: 52.80) by more than a third and indicates that Indian research contributions are represented in the dataset in smaller numbers, but with exceptionally high scientific reception. The USA (120 TC, Ø 5.70), Italy (111 TC, Ø 10.10), the United Kingdom (99 TC, Ø 9.00) and Sweden (96 TC, Ø 10.70) complete the top 10.

The geographical distribution of citation activity underlines the European dominance in the research field: Seven of the ten most cited countries are European, which consistently confirms the findings of the Three-Field Plot (Figure 3) and the Country Collaboration Map (Figure 5). At the same time, the high citation rate of non-European countries such as India and China indicates that the global reception of agile methods in SMEs extends beyond the European core area – a finding that underlines the need for a stronger international research perspective.

Table 3: Most cited countries

Country	TC	Average Article Citations
SPAIN	405	25,30
GERMANY	233	9,00
CHINA	211	52,80
PORTUGAL	150	15,00
POLAND	145	14,50
INDIA	142	71,00
USA	120	5,70
ITALY	111	10,10
UNITED KINGDOM	99	9,00
SWEDEN	96	10,70

Source: Own processing using Biblioshiny

Figure 5 visualizes the geographical distribution of research activity as well as the international cooperation relationships in the analyzed publication corpus. The intensity of the country coloration represents the relative publication density, while the connecting lines between the countries represent the strength of bilateral co-authorship — the broader and darker a line, the more often joint publications between the respective countries were recorded.

The map confirms and deepens the citation data presented in Table 3: Western Europe forms the geographical center of the research field. In particular, Germany, Spain, Portugal, the United Kingdom, France and the Netherlands appear in deep dark blue, which indicates a particularly high density of publications. The strongest single connection runs between Western Europe and the USA, represented by a strikingly wide, dark red-brown line — a finding that identifies the transatlantic axis as the dominant cooperation structure in the field of agile methods in SMEs. This connection clearly towers over all other collaboration lines in strength and frequency.

Beyond the main transatlantic axis, several secondary collaboration connections can be identified. Western Europe has recognizable research relations with Brazil, India, and Australia, represented by middle red lines. These connections point to a selective but growing internationalization of the field of research that extends beyond the traditional Western core area. Latin America — especially Brazil and Argentina — is also recognizable in light blue and also has links to the United States. Asia (India, China, Southeast Asia) and Australia are visible as participating regions, but their collaboration intensity lags significantly behind the European-American core area.

The absence of collaboration lines for African and Central Asian countries is striking, which appear predominantly gray on the map. This points to a structural geographical asymmetry in the knowledge production process: despite its global relevance, research on agile methods in SMEs is still concentrated in highly developed industrial nations. For the generalizability of the research results, this implies that context-specific factors — such as different economic structures, regulatory frameworks and corporate cultures in non-Western countries — may be underrepresented in existing studies and should be given greater consideration in future research projects.

Figure 5: Countries Collaboration World Map

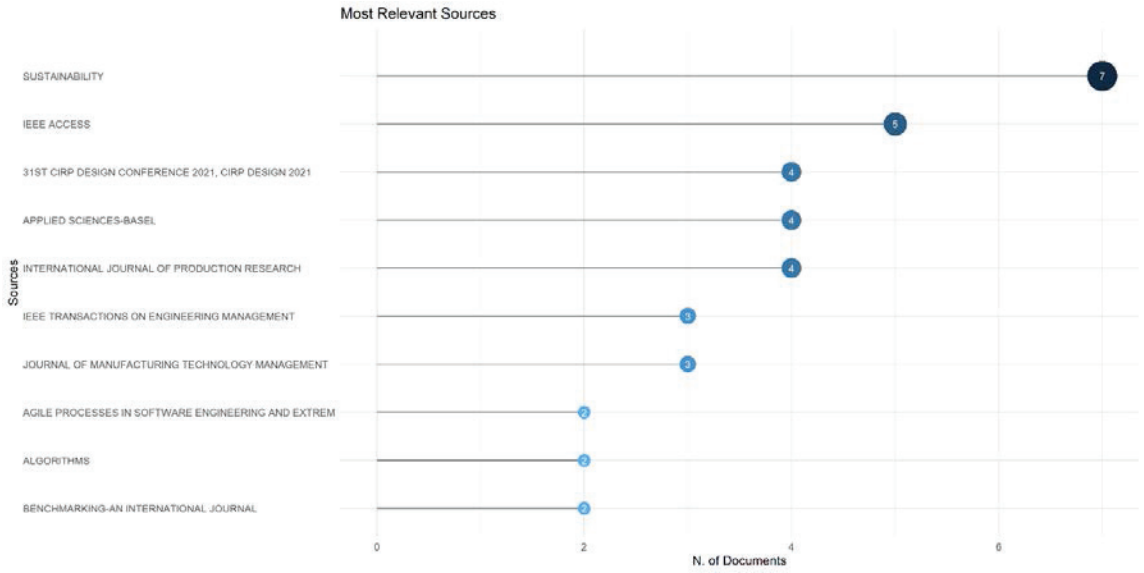
The bibliometric analysis of the publication organs shows a broad dispersion of the N=190 articles across different journals and conference proceedings. Table 4 lists the ten most frequently represented sources. Sustainability (MDPI) clearly leads the ranking with seven articles, followed by IEEE Access with five articles. Four contributions each will be made to the 31st CIRP Design Conference 2021, Applied Sciences-Basel and the International Journal of Production Research – three sources that underline the engineering and production technology relevance of the research field. IEEE Transactions on Engineering Management and the Journal of Manufacturing Technology Management follow in fifth place with three articles each. Other sources such as Agile Processes in Software Engineering and Extreme Programming, Algorithms and Benchmarking – An International Journal are represented with two articles each. The dominance of open access journals (Sustainability, IEEE Access, Applied Sciences-Basel) reflects the trend towards open science and indicates a high visibility of research results. The distribution via journals from engineering, management and computer science proves the interdisciplinary character of the research field.

Table 4: Most relevant sources



Source: Own processing using Biblioshiny

Table 5 lists the ten most cited documents within the analyzed dataset (N=190). The most cited work is Nunez-Merino et al. (2020) with 266 total citations (TC) and a TC per year value of 38.00, highlighting its continued relevance as groundwork on Industry 4.0 technologies and lean supply chain management. Cai et al. (2020) follow in second place with 135 citations (TC/year: 19.29), followed by Han & Trimi (2022) with 105 citations (TC/year: 21.00). Mathiyazhagan et al. (2021) and Mrugalska & Ahmed (2021) occupy fourth and fifth place with 91 and 85 total citations, respectively.

Particularly noteworthy is the normalized TC value, which weights the citation frequency relative to the year of publication and thus enables a bias-free comparison of older and more recent publications. Marrucci et al. (2025) has the highest normalized TC value of 16.76 despite only 43 total citations – an indicator of an exceptionally high reception speed and the growing relevance of Industry 4.0 implementation strategies in SMEs. Also noteworthy is Nunez-Merino et al. (2020) with a normalized TC of 10.22, confirming the lasting effect of this work on the field of research.

Die Zusammensetzung der meistzitierten Dokumente spiegelt die interdisziplinäre Ausrichtung des Forschungsfeldes wider: Neben Managementzeitschriften (Management Decision, Research-Technology Management) sind technologieorientierte Journals (Technological Forecasting and Social Change, IEEE Transactions on Software Engineering) sowie nachhaltigkeitsbezogene Outlets (Sustainability, Science of the Total Environment) vertreten. Dies unterstreicht, dass die Forschung zu agilen Methoden in KMU an der Schnittstelle von Technologiemanagement, Organisationswissenschaft und Nachhaltigkeitsforschung angesiedelt ist.

Figure 6 shows the Word Cloud of the analyzed dataset (N=190), where the font size of each term is proportional to its frequency in the corpus. The visualization provides a quick overview of the dominant topics and concepts of the research field. Particularly striking is the simultaneous emergence of several terms in maximum size: "challenges", "management", "performance" and "agile" dominate the presentation together, which indicates a broad, multi-

thematic orientation of the research field. It is noteworthy that "challenges" – classified as a basic theme in the Thematic Map – is one of the largest terms in the Word Cloud and thus has a high lexical presence in the dataset despite scientific underdevelopment.

On the second size level, terms such as "organizational agility", "scrum", "agile software development", "framework", "innovation" and "model" can be seen. These terms represent established concepts of agile management and confirm the thematic breadth of the field. The appearance of "scrum" as a prominent term underlines the relevance of concrete agile frameworks in research, while "organizational agility" emphasizes the strategic dimension of the topic. Medium font sizes show terms such as "implementation", "kanban", "digital transformation", "sustainability", "capabilities" and "impact", which refer to adjacent research fields and prove the interdisciplinary embedding of the topic.

Smaller terms such as "barriers", "smes", "industry 4.0", "manufacturing", "adoption", "lean manufacturing", "simulation", "dynamic capabilities", "digital twin" and "business agility" are present, but much less prominent. Particularly relevant for the present study is the comparatively small font size of "barriers" and "smes": Although implementation barriers in SMEs form the core of the research question, these terms are only used peripherally in the overall corpus. This confirms the research gap identified in the Thematic Map and underlines the need for a more targeted scientific examination of the specific challenges of agile implementation in the SME context.

Figure 6: World Cloud

Source: Own processing using Biblioshiny

Figure 7 shows the thematic map of the research field, which is based on the science mapping approach of Cobo et al. (2011). The horizontal axis represents the degree of relevance (centrality), the vertical axis the degree of development (density). The dotted lines divide the map into four quadrants: Motor Themes (top right), Niche Themes (top left), Basic Themes (bottom right), and Emerging or Declining Themes (bottom left). The circular area of each cluster is proportional to the number of related articles, which allows for a visual weighting of the topics according to their presence in the dataset.

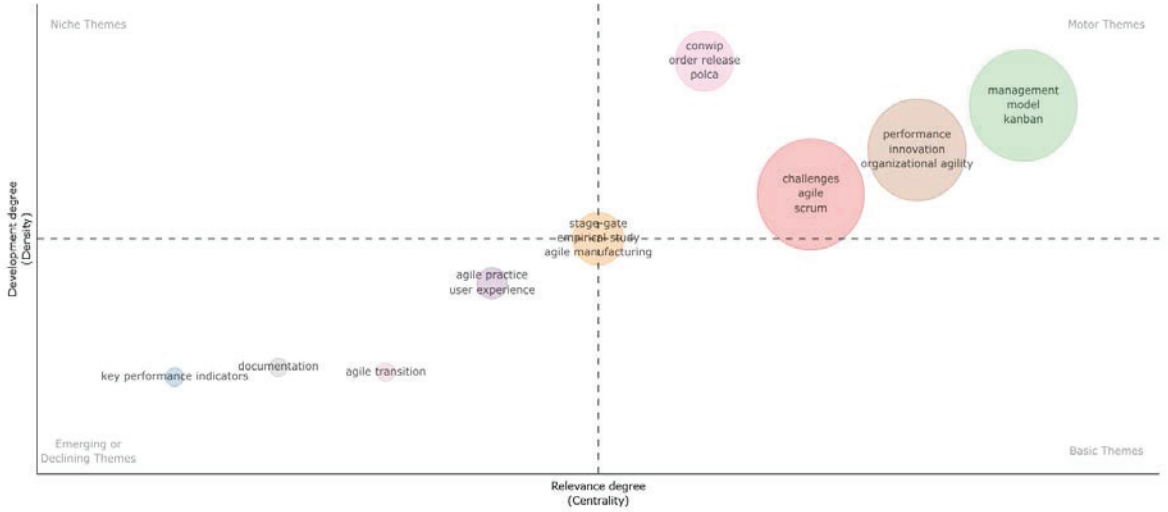
There are two clusters in the Motor Themes quadrant (top right): The larger green cluster includes the terms "management", "model" and "kanban" and represents established management concepts and concrete agile frameworks that are both centrally and scientifically well developed. The neighboring beige cluster contains "performance", "innovation" and

"organizational agility" – three core concepts that map the performance and innovation dimension of agile organizations. Both clusters prove that research is primarily focused on the potentials and results of agile methods. In the Niche Themes quadrant (top left) there is a small pink cluster with the terms "conwip", "order release" and "polca" – highly specialized production control concepts with little networking to the main research stream, but high internal density.

The Basic Themes quadrant (bottom right) contains the most striking finding of the entire analysis: By far the largest circle of the entire thematic map includes the terms "challenges", "agile" and "scrum". This cluster is highly relevant for the research field (high centrality), but has a low density – it is scientifically underdeveloped and thus represents the central research gap of the present study. The size of the circle underlines that this complex of topics covers a significant part of the dataset without any in-depth, coherent scientific penetration. In addition, a medium-sized orange cluster with "stage-gate", "empirical study" and "agile manufacturing" positions itself on the border between basic and motor themes. In the Emerging or Declining Themes quadrant (bottom left), there are three small clusters: "agile practice" and "user experience" (purple), "key performance indicators" and "documentation" (blue), and "agile transition" (purple). These topics are both under-central and under-developed scientifically, and are either in an early phase of development or in a decline in research activity.

The Thematic Map thus provides the strongest empirical evidence for the research gap of this study: Implementation barriers of agile methods – represented by the cluster "challenges, agile, scrum" – are the most relevant, but least penetrated topic in the entire research field.

Figure 7: Thematic Map



Source: Own processing using Biblioshiny

Figure 8 shows the co-occurrence network of the dataset, which visualizes the frequency of co-occurrence of keywords in scientific articles. The node size is proportional to the frequency of the respective keyword in the overall corpus; the line thickness reflects the strength of the co-competition between two terms. The network is divided into five colour-coded clusters, each representing thematically coherent strands of research.

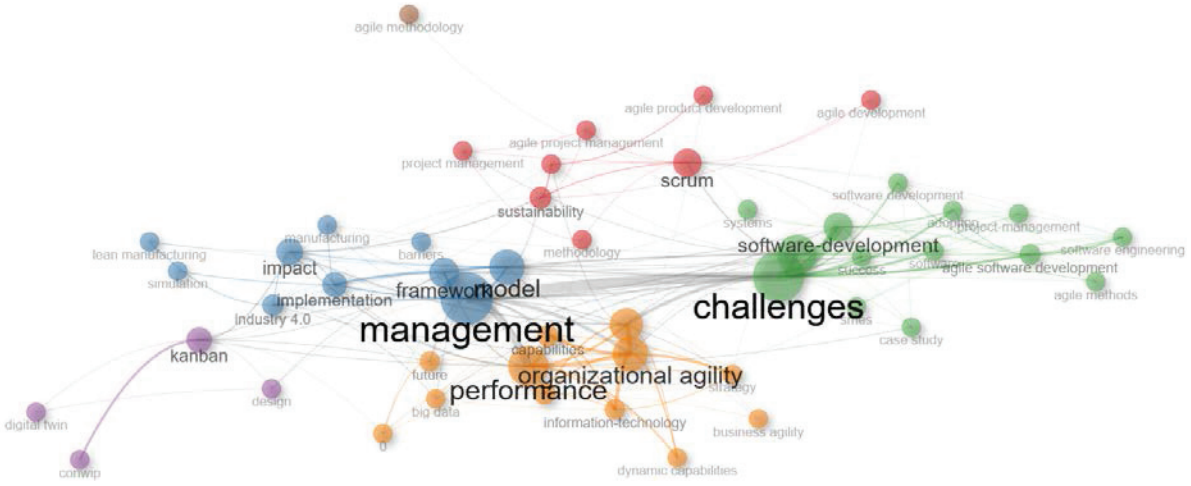
The blue cluster forms the management center of the network and is dominated by "management" as one of the two largest nodes in the entire network. Other central nodes of this cluster are "framework", "model", "implementation" and "impact". Peripheral terms include "manufacturing", "lean manufacturing", "barriers", "simulation", "industry 4.0", "sustainability" and "methodology". Particularly relevant is the occurrence of "barriers" as a small, peripheral node in this cluster: Despite the proximity to the research core in terms of content, the term is

hardly networked with other nodes, which impressively demonstrates its scientific marginal position in the field. The orange cluster represents the performance and agility strand of the research field. Its central nodes "performance" and "organizational agility" are large and strongly interconnected. Other terms of this cluster are "capabilities", "future", "big data", "information-technology", "dynamic capabilities", "business agility" and "strategy".

The green cluster contains "challenges", the second of the two largest nodes in the entire network – on a par with "management". Together with "software-development", "challenges" forms the center of this cluster, which also includes "agile software development", "smes", "systems", "adoption", "success", "software", "software engineering", "agile methods", "case study" and "project-management". The prominent size of "challenges" in the green cluster and its strong networking with "software-development" and "smes" shows that implementation challenges are primarily discussed in the context of software development and the SME environment – an important contextualization for the research question. The red cluster focuses on agile project management methods and is dominated by "scrum" as the central node. Other terms include "agile project management", "agile product development", "agile development", "project management" and "sustainability". The purple cluster forms an independent, less networked strand with "kanban" as the central node and "digital twin", "conwip" and "design" as peripheral terms.

The network structure provides an important addition to the Thematic Map: While "challenges" was classified in the Thematic Map as a basic theme with high centrality and low density, the Co-Occurrence Network confirms its relevance with one of the largest node sizes in the entire network. At the same time, the cluster analysis shows that "barriers" – the central concept for the research question of this study – appears as a small, peripheral node in the blue cluster and hardly co-occupies with other terms. From another analytical perspective, this underlines the identified research gap: Implementation barriers of agile methods in SMEs are thematically present, but have not yet been scientifically established as an independent, coherent research focus.

Figure 8: Co-Occurrence Network



Source: Own processing using Biblioshiny

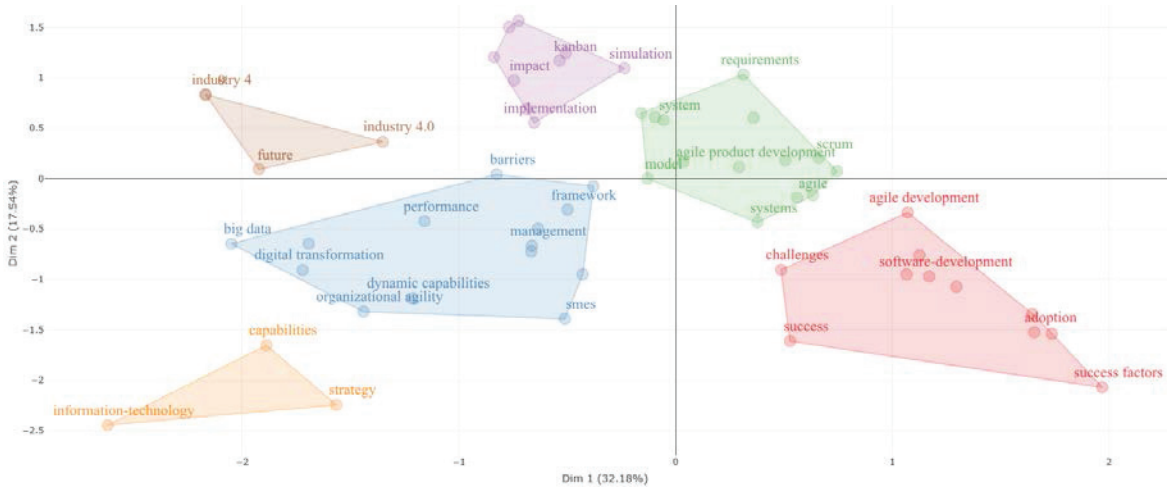
Figure 9 shows the factor analysis (correspondence analysis) of the keyword space. The horizontal axis (Dim 1) explains 32.18% of the total variance and primarily distinguishes between technological-strategic terms (left) and application-oriented terms (right). The vertical axis (Dim 2) explains another 17.54%, so that both dimensions together represent 49.72% of the

total variance in the dataset. Factor analysis complements the Co-Occurrence Network with a dimension-reducing perspective: While the network maps networking strengths, factor analysis shows the latent basic structure of the research field based on the distribution of variance.

Six clusters are recognizable in two-dimensional space. The blue cluster (center-left) is the largest and includes "performance", "framework", "management", "barriers", "big data", "digital transformation", "dynamic capabilities", "organizational agility" and "smes". It represents the core strand of the research field, which combines management and performance concepts with digital transformation topics. The position of "barriers" within this cluster is again remarkable: although the term is located in the central cluster, it is clearly outside the densely grouped core terms – further evidence of its scientific marginal position. The red cluster (bottom right) includes "challenges", "software-development", "agile development", "success", "adoption" and "success factors" and forms an independent strand that combines implementation challenges with success factors and adoption topics. The spatial separation of this cluster from the blue core cluster along the Dim-1 axis illustrates that research on implementation challenges forms a conceptually distinct strand that has so far been little linked to the management mainstream.

The green cluster (top right) groups "requirements", "system", "agile product development", "scrum", "model", "agile" and "systems" – terms from the agile product development context. The purple cluster (middle-top) combines "kanban", "impact", "implementation" and "simulation" as methodological-operational concepts. The orange cluster (bottom left) includes "capabilities", "strategy" and "information-technology" and represents the resource- and strategy-oriented research strand. The brown cluster (top left) contains "industry 4", "future" and "industry 4.0" as future-oriented technology terms. The factor analysis thus confirms the findings of the Thematic Map and Co-Occurrence Network: The research field has a clear basic structure in which implementation barriers (red cluster) and the management mainstream (blue cluster) form conceptually separate, less integrated strands.

Figure 9: Factorial Analysis



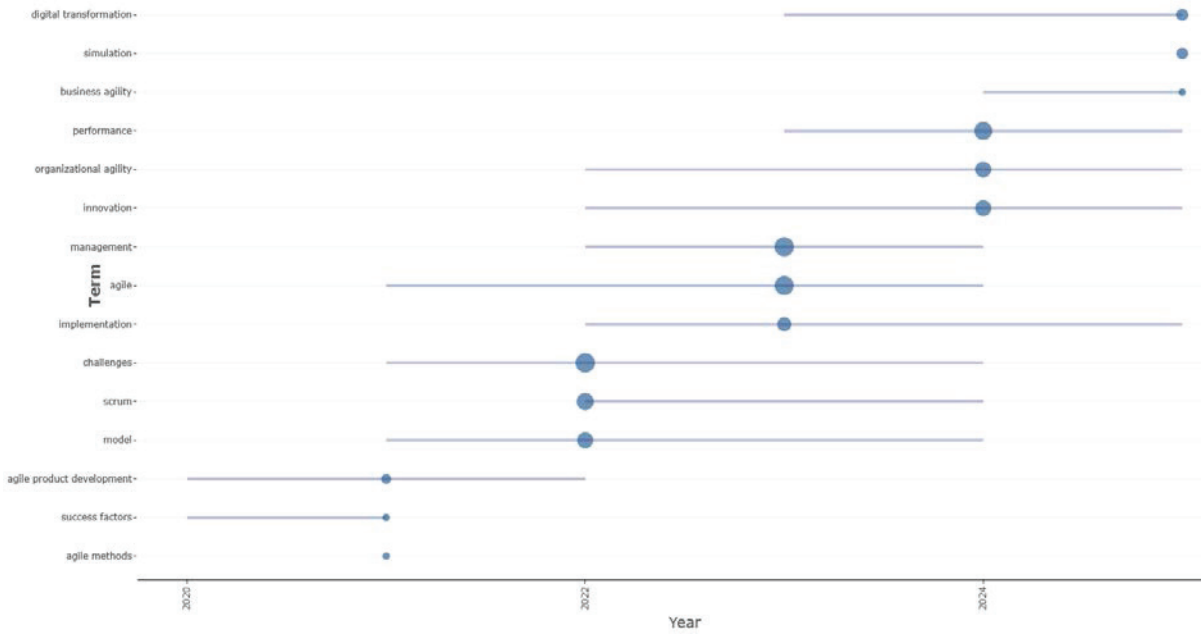
Source: Own processing using Biblioshiny

Figure 10 shows the trend-topic analysis of the dataset in the period 2020–2025. The horizontal axis depicts the course of the year, the vertical axis lists the 15 most active terms. Line length represents the total activity period of a term in the dataset, while point size reflects the relative frequency of the term in each peak year. The visualization allows a precise reconstruction of the temporal development of the research field in three clearly definable phases.

In the first phase (2020–2021), basic terms with short activity windows and small point sizes dominate: "agile methods" reaches its peak as early as 2020 and then loses relevance, followed by "success factors" and "agile product development", both of which reach their peak around 2021 and disappear from active discourse by 2022. These early terms represent the initial research focus on the operational foundations of agile methods. In the second phase (2021–2023), "challenges", "scrum" and "model" come to the fore with their peaks around 2022 – with "challenges" having the largest point size of this phase, confirming its high presence in the dataset. At the same time, "management", "agile" and "implementation" will become active from 2022 onwards and reach their peaks around 2023. Zasa et al. (2020) point out that the coexistence of agile and traditional management approaches in hybrid organizational models is a growing challenge – a finding that substantiates the observed activation of "management" and "implementation" as research topics in this phase.

In the third phase (2024–2025), a significant paradigm shift will take place: "performance", "organizational agility" and "innovation" will reach their greatest point sizes around 2024 and will remain active until 2025. New additions include "digital transformation", "simulation" and "business agility", which will not appear until 2023–2024 and reach their peaks in 2024–2025 – with "digital transformation" and "business agility" currently being the most active terms in the entire dataset. This temporal shift from operational implementation topics to strategic concepts proves that the scientific community is increasingly discussing agile methods in the context of higher-level transformation processes. For the research gap of this study, it is significant that "challenges" already reached its peak in 2022 and has been declining since then – while strategic concepts such as "business agility" and "digital transformation" are gaining momentum. This suggests that research is leaving the challenge level in favor of a strategic framework, without having systematically penetrated the implementation barriers at the SME level.

Figure 10: Trend Topics



Source: Own processing using Biblioshiny

3. Discussion

For RQ1, the analysis of the annual article production and citation development shows a continuous increase in the cumulative number of articles from about 27 in 2020 to around 46 in 2025, with pronounced growth phases especially in the years 2022 and 2024–2025. The annual growth rate of 11.24% confirms that barriers to implementation of agile methods are increasingly perceived as a relevant field of research in SMEs, although the absolute number of publications remains low compared to established research fields. The thematic map confirms the central research gap of the present study: The term "challenges" is classified as a basic theme, which means that implementation barriers are central to the research field, but remain scientifically underdeveloped. In contrast, "performance", "organizational agility" and "innovation" are established as motor themes, suggesting that research is primarily focused on the potentials of agile methods, while the practical challenges of their implementation are neglected. The co-occurrence network confirms and differentiates this finding: "challenges" is one of the two largest nodes in the entire network and, together with "software-development", forms the center of the green cluster. At the same time, "barriers" appears only as a small, peripheral node in the blue cluster – hardly networked and scientifically marginal.

The trend topic analysis (Figure 10) reveals a three-phase paradigm shift in the research field: In phase 1 (2020–2021), basic operational terms such as "agile methods", "success factors" and "agile product development" with short windows of activity dominate. Phase 2 (2022–2023) brings "challenges" to a climax with the biggest point of this phase, accompanied by "scrum", "model", "management" and "implementation". In phase 3 (2024–2025), strategic concepts such as "performance", "organizational agility", "innovation", "digital transformation" and "business agility" gain the upper hand – with "digital transformation" and "business agility" currently being the most active terms in the entire dataset. This temporal shift indicates that the scientific community is increasingly discussing agile methods in the context of higher-level transformation processes, instead of working on implementation barriers as an independent field of research. It is particularly revealing that "challenges" already reached its peak in 2022 and has been declining since then – an indicator that research is leaving the challenge level without having systematically penetrated it. This development is in line with Zasa et al. (2020), who describe the increasing embedding of agile methods in hybrid transformation strategies, as well as Mishra et al. (2021) and Flores-Cerna et al. (2022), who conceptualize agile methods as an integral part of digital transformation processes. The analysis of the most cited documents underlines this observation: The highly cited papers of Han & Trimi (105 TC) and Mathiyazhagan et al. (91 TC) focus primarily on Industry 4.0 and performance aspects, while implementation barriers are not the focus of scientific attention.

The fragmentation of authorship, with Albers Albert leading with five articles and the majority of relevant authors having contributed only two to three articles, suggests that no dominant researcher or established research group exists in the field. This observation is confirmed by the wide dispersion of publications across different journals, with IEEE Engineering Management Review, Sustainability and Technological Forecasting and Social Change each publishing only two articles. The research field is thus young, decentralized and interdisciplinary, which is typical for emerging research areas. The lack of concentration on a few leading authors and journals makes it difficult to develop coherent research programmes and the systematic accumulation of knowledge.

The present results confirm the research gap identified by Mollet et al. (2023) and underline the need for increased scientific engagement with the practical challenges of implementing agile methodologies in SMEs. The link to existing literature shows that organizational barriers, cultural resistance, and resource-related factors are considered key barriers to implementation (Mishra et al., 2021; Flores-Cerna et al., 2022), however, these have not yet been systematically investigated in the context of Dynamic Capabilities Theory and digital transformation. Mata et al.

(2023) expand on this finding and show that a company's absorptive capacity – i.e. its ability to absorb, assimilate, and transform external knowledge – has a decisive influence on strategic agility: SMEs with higher absorptive capacity are significantly better able to successfully implement agile methods and respond to market changes. This implies that implementation barriers are not only due to a lack of processes or resources, but also to structural deficits in knowledge processing. In addition, Eryarsoy et al. (2022) show that organizational learning acts as a mediator between strategic flexibility and supply chain agility: Companies that have established systematic learning processes are better able to adapt agile practices to their specific contextual conditions and anchor them sustainably. These findings suggest that future research should conceptualize barriers to implementation more from the perspective of organizational learning and knowledge capacities. The observation that "dynamic capabilities" will not emerge as a trend topic until 2024–2025 suggests that research is beginning to develop a theoretical framework for the analysis of implementation barriers that goes beyond purely operational descriptions. This conceptual maturation of the field is promising, but requires further empirical validation through qualitative and quantitative primary studies.

4. Conclusion

Concrete Managerial Implications

The present findings provide concrete recommendations for action for SME managers who want to implement agile methods. First, organizational barriers should be systematically addressed, with a special focus on the necessary cultural change and the adaptation of leadership style. The analysis shows that organizational agility is established as a motor theme, suggesting that successful implementations require holistic organizational transformation that goes beyond the mere adoption of agile practices. SMB managers should therefore take a step-by-step approach to implementation, avoiding a "big bang" strategy and instead focusing on incremental changes. The use of established frameworks such as Scrum or Kanban can serve as a low-threshold entry point to gain initial experience with agile methods and initiate organizational learning processes.

The allocation of resources is a particular challenge for SMEs, as they typically have limited financial and human resources. In this context, Marrucci et al. (2025) show that manufacturing SMEs with insufficient digital maturity are particularly vulnerable to implementation barriers and that targeted investments in digital infrastructure and employee qualification significantly improve the chances of success of agile transformations. The findings suggest that SMB managers should develop realistic expectations regarding resource requirements and invest specifically in employee qualification and change management, as these are considered key factors for successful implementations. The orientation towards the Dynamic Capabilities Theory provides a conceptual framework for implementation: SMEs should systematically develop their skills for sensing (recognizing market changes), seizing (seizing opportunities) and reconfiguring (adapting organizational resources). This requires the establishment of feedback mechanisms, the promotion of experimental learning processes and the creation of flexible organizational structures that enable rapid adjustments. Future research should validate these recommendations for action through qualitative case studies and identify context-specific success factors.

In addition, SME managers should make targeted use of external support services, such as consulting services, industry networks and government funding programmes for digital transformation. The findings show that the transition to agile methods should not be understood as a purely technical or procedural problem, but as a fundamental organizational change that requires a strategic leadership perspective. In this context, Silva et al. (2022) illustrate that linking agile methods to sustainability goals not only increases social acceptance, but can also increase employee motivation internally and facilitate the implementation process – a finding

that is particularly relevant for SMEs with a pronounced awareness of sustainability. Linking agile methods with overarching goals such as sustainability, innovation and digital competitiveness can increase employee acceptance and facilitate the implementation process.

Limitations of the Analysis

A major limitation of the present analysis is that only the Web of Science database was used as a data source. Other relevant databases such as Scopus or Google Scholar were not included, which can lead to a potential bias in the results, as certain publications or research strands may be underrepresented. The restriction to English and German articles leads to the exclusion of relevant research from other language areas, especially from Asian or Latin American countries, where SMEs play a significant economic role. The bibliometric analysis also primarily covers quantitative aspects such as publication activity, citation frequency and keyword co-occurrences, while the content quality and methodological rigor of the individual studies are not systematically evaluated. This means that highly cited papers do not necessarily represent the best quality or methodologically sound contributions.

While the chosen period of 2020-2025 allows for the capture of current developments, it excludes previous research before 2020 that may have made fundamental theoretical or empirical contributions. The dependence of results on the search string used is another methodological limitation, as alternative keyword combinations could lead to different results. The present analysis is based on a specific combination of terms related to agile methodologies, SME context and implementation barriers, whereby the selection of these terms necessarily involves subjective decisions. Finally, it should be taken into account that the field of research is growing rapidly and developing dynamically, so that the results of 2025 could already be partially outdated by the time of publication. The extreme fragmentation of authorship and the broad dispersion across different journals also make it difficult to identify coherent research programs and to assess the scientific maturity of the field.

Suggestions for Future Research

Future research should address the identified limitations and deepen the existing findings through complementary methodological approaches. Qualitative case studies to deepen the identified barriers are needed to understand the specific mechanisms by which organizational, cultural, and resource factors hinder the implementation of agile methodologies in SMEs. Cross-country comparative studies could systematically examine cultural differences in implementation barriers and identify context-specific success factors, as the present analysis does not allow for a differentiated view of national or regional specificities. Longitudinal studies on the development of agile maturity in SMEs would make it possible to follow transformation processes over longer periods of time and to identify critical phases and turning points.

The inclusion of Scopus and other databases would provide a broader overview of the research field and increase the validity of the findings. A special focus should be placed on non-IT SMEs, as the present analysis shows that research is strongly focused on IT and digitalization-related contexts, while manufacturing companies, craft businesses and service companies are underrepresented. In this context, Mathiyazhagan et al. (2021) provide an example of how the integration of Lean and Agile principles in the manufacturing context can be analyzed – an approach that is particularly relevant for manufacturing SMEs and should be transferred to implementation barriers in future studies. The question of how digital platform strategies can support the implementation of agile methodologies in SME networks also remains largely unanswered; Han & Trimi (2022) offer a conceptual starting point for this, which should be deepened in primary empirical studies. The integration of Dynamic Capabilities Theory as an

overarching theoretical framework should be further expanded in future studies in order to systematically investigate the connection between agile methods, organizational agility and long-term competitiveness of SMEs. Finally, a replication of this analysis including the period before 2020 would be recommended in order to fully understand the historical development of the research field and to identify continuities as well as breaks in the scientific examination of implementation barriers of agile methods.

Decentralization of Personnel Development in SMEs: Organizational Agility through Individualized Competence Development with Decentralized Multipliers - A Bibliometric Analysis

Herbert Christian Becker[1]

[1*]*Department of Management, Faculty of Business Management atBratislava University of Economics and Business, Slovakia*

**Corresponding Author: herbertchristian.becker@euba.sk, ORCID: 0009-0002-9461-1672*

Abstract

Small and medium-sized enterprises (SMEs) are under pressure to respond agilely to market changes whilst developing the skills of their employees and managers in an even more targeted and personalised manner. Traditional, centralised human resources development (HRD) structures are increasingly proving too inflexible to meet these requirements. This paper examines the extent to which the decentralisation of HRD responsibilities from central HR departments to decentralised multipliers such as line managers and team leaders offers SMEs advantages in terms of organisational agility and individual skills development. Based on a systematic literature review and bibliometric analysis, using the Bibliometrix R-package, of 628 documents from the Web of Science between 2016–2026, this study identifies the intellectual structure, thematic development and key research clusters in this field. The research is predominantly shaped by authors from China, the UK, Slovakia and other European countries. Despite the high relevance of agility and performance enhancement in SMEs, the explicit link between decentralised HRD, line manager empowerment and individualised competence development remains underrepresented. The analysis suggests that decentralised HRD approaches, when supported by capable multipliers and a conducive learning environment, can significantly improve the organisation's responsiveness and enables work-integrated competence development. The study also identifies research gaps, particularly regarding empirical impact analyses of decentralised HRD approaches on organisational agility and productivity in SMEs. The findings contribute to the theoretical understanding of agile human resource management in SMEs and provide practical implications for organisational structures seeking to replace standardised training formats with individualised development and career paths.

Keywords*: Decentralization, Human Resource Development, SME, Organizational Agility, Competence Development, Bibliometric Analysis*

1. Introduction

Small and medium-sized enterprises (SMEs) form the backbone of the German and European economy (European Commission. Joint Research Centre., 2023; European Commission. Joint Research Centre. & European Commission. Directorate General for Internal Market, Industry, Entrepreneurship and SMEs., 2025). In an environment characterized by volatility, uncertainty, complexity and ambiguity (VUCA) (Lenz, 2019), their long-term competitiveness depends to a large extent on the ability to react quickly and flexibly to market and technological changes in terms of organizational agility (Nijssen & Paauwe, 2012). Traditional HRD approaches, often centralized and uniform, are increasingly inadequate for the dynamic needs of SMEs, where agility, cost-efficiency, and personalized employee development are paramount.

The author's dissertation entitled *Individualization in Human Resources Development for Competence Development – Increasing Productivity in Small and Medium-Sized Enterprises*

examines the extent to which individualization of personnel development can increase productivity in SMEs. A central object of investigation is the question of whether the shift of HRD responsibility from central personnel development units to decentralized multipliers (line managers and executives) offers advantages over traditional, centralized approaches (Beattie, 2006; Garavan et al., 2017).

Despite the high practical relevance, the scientific literature shows a clear gap. A bibliometric analysis of 628 English-language documents (2016–2026) from Scopus and Web of Science, limited to publications related to the EU, North America and Asia, confirms that topics such as *performance*, *innovation*, *SMES* and *dynamic capabilities* are intensively researched, but the explicit link between decentralized personnel development, individualized competence development among line managers and organizational agility.

Against this background, the present thesis pursues the following four research questions:

RQ1: How has the research field on the decentralization of personnel development in SMEs developed thematically in the period 2016–2026, and what trends can be identified in terms of organizational agility and individualized competence development?

RQ2: Which authors, institutions, and countries dominate research on decentralized and individualized personnel development in SMEs?

RQ3: What conceptual clusters and thematic structures characterize the field of research?

RQ4: How is the link between decentralized workforce development, organizational agility, and SME-specific contextual factors conceptualized in the literature, and what research gaps can be identified?

The thesis thus provides a bibliometric foundation and thematic embedding for the central research question of the dissertation and contributes to closing the identified theoretical and empirical gap.

2. Theoretical background

The theoretical framework of this thesis links three central research strands: the decentralization of Human Resource Development (HRD), the concept of organizational agility and the dynamic capabilities theory. These strands are linked by the perspective of individualized competence development among decentralized multipliers (line managers and executives). The agility factor is the central dependent variable and is understood as a strategic lever for increasing competitiveness and productivity in SMEs.

*2.1 Decentralization of personnel development and the role of line managers:*The shift of HRD responsibility from central HR units to line managers has long been discussed as the devolution or decentralization of HRM (Beattie, 2006; Garavan et al., 2017; Petruzzellis et al., 2006). Line managers take on the function of decentralized multipliers by directly accompanying, promoting and shaping the individual competence development of their employees. This approach allows for greater individualization and faster response to specific needs, but at the same time carries the risk of inconsistent implementation and a lack of strategic alignment (Guest & Bos-Nehles, 2013).

2.2 Organizational agility in SME´s: Organizational agility describes the ability of a company to react quickly and flexibly to volatile market and environmental changes (Nijssen & Paauwe, 2012). For resource-constrained SMEs, agility is a decisive competitive factor, as these companies have less bureaucratic structures to fall back on. Nijssen and Paauwe emphasize that agility can be achieved through a scalable workforce, rapid knowledge development and an adaptable organizational infrastructure. Geibler et al. add that agility is particularly important in

family-run SMEs to disrupt traditional, linear innovation processes and accelerate them through open innovation and design thinking (Von Geibler et al., 2023). Agility manifests itself primarily through decentralized decision-making processes and continuous adaptation of competencies.

2.3 Dynamic Capabilities as an Overarching Theoretical Framework: The Dynamic Capabilities Theory (Teece, 1994, 2007) serves as an integrative framework. She explains how companies achieve sustainable competitive advantages by reconfiguring internal resources and competencies (*sensing, seizing, transforming*) in dynamic environments. Nijssen and Paauwe (Nijssen & Paauwe, 2012) show that HRM practices contribute significantly to the development of dynamic skills in turbulent times. In SMEs, this development is particularly promoted by decentralized and individualized HRD, as it anchors organizational learning and adaptability at the level of individual employees and teams (Jungclaus, 2022; Meil & Heidling, 2005).

2.4 Individualized competence development and agile learning: Individualized competence development is becoming increasingly important in distributed and agile work environments (Meil & Heidling, 2005). In her study on agile sprint learning, Jungclaus shows that self-directed, iterative learning processes in small teams promote professional competencies at high levels and enable both individual and organizational learning (Jungclaus, 2022). Such approaches directly link individual competence development with agile working methods and support the decentralization of HRD.

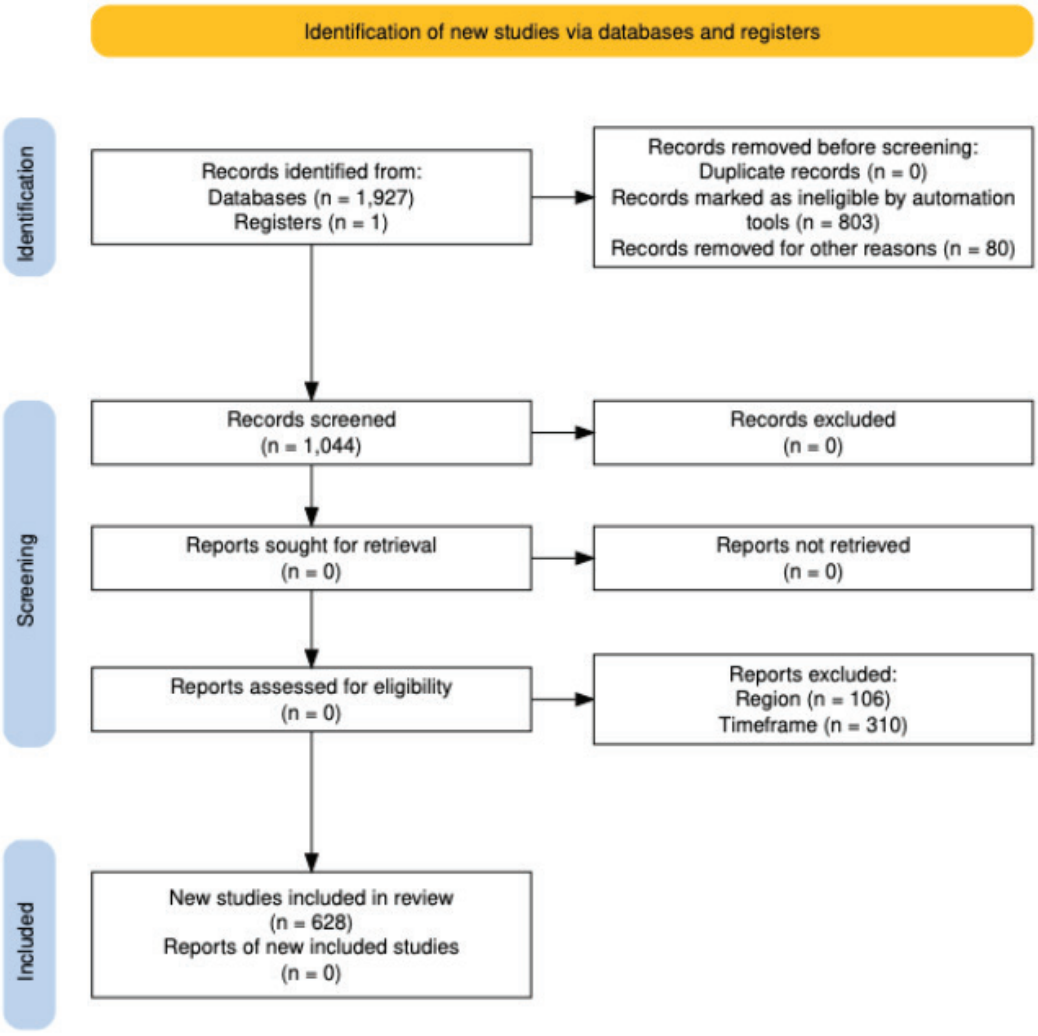
2.5 Integration of concepts: The present thesis integrates these strands by conceptualizing decentralized HRD as a strategic mechanism for the development of dynamic capabilities and thus for increasing organizational agility in SMEs. Individualized competence development among line managers as decentralized multipliers is seen as a central mediator between HRD and agility. The agility factor thus forms the dependent variable that is to be positively influenced by decentralized and individualized HRD measures. This theoretical framework addresses a central gap in the previous literature: While dynamic capabilities and organizational agility are intensively studied (Nijssen & Paauwe, 2012; von Geibler et al., 2023), there is a lack of a systematic analysis of how the decentralization and individualization of personnel development specifically contributes to the development of agile skills in SMEs.

3. Methods and methodology

The present study is based on the PRISMA 2020 standard for systematic literature reviews (Page et al., 2021) and combines it with a bibliometric analysis using the R-package Bibliometrix (Aria & Cuccurullo, 2017). The Web of Science Core Collection served as the sole data source, as this database offers the highest coverage of high-quality, peer-reviewed journals in the field of management and economics and ensures high reproducibility. The systematic search was conducted on April 12, 2026. The full search string was: *ALL=((productiv* OR enhanc* OR improv* OR increas* OR gain* OR growth) AND (employee OR workforce OR labor OR labour OR productiv*) AND (competenc* OR develop* OR skill* OR capabilit*) AND ("HRD" OR "human resource development" OR "employee development" OR "staff development" OR "workforce development" OR "talent development" OR "personnel development" OR "training" OR "development" OR "learning and development" OR "management development" OR "career development" OR "leadership development" OR "professional development" OR "leadership" OR team* OR "transformational leadership" OR individual*) AND (agile OR organiz* OR business OR decision*) AND ("SME" OR "small and medium sized enterprises")).* The search initially returned 1,927 hits. The following filters were then applied: English language, research areas Economics and Management, countries/regions EU, North America and Asia, and publication period 2016–2026. After applying these filters, 628 documents remained, which formed the final database. The filters were chosen deliberately: The period 2016–2026 focuses on the current phase of strong digitalization, post-COVID changes and increasing agility requirements. The restriction to

the research areas of economics and management ensures the subject-specific relevance. The language filter English corresponds to the international language of science and ensures comparability. The geographical restriction to the EU, North America and Asia occurred because HRD practices are highly culturally and contextually dependent and differ significantly between regions (Brewster & Mayrhofer, 2012; Farndale et al., 2017).The selected economic areas represent the world's three most important SME markets with different institutional, cultural and regulatory frameworks, so that a meaningful and comparable analysis is possible without jeopardizing comparability through global dispersion. The 628 documents were completely imported into Bibliometrix and evaluated with the Biblioshiny graphical user interface. The bibliometric analysis included descriptive statistics, keyword co-occurrence networks, thematic maps, trend topics, the conceptual structure map using multiple correspondence analysis (MCA), three-fields plots and country collaboration maps. All key figures and visualizations are based exclusively on this final, filtered web of science database.

Figure 1. PRISMA 2020 Flow Diagram of the study selection process



4. Results

The bibliometric analysis is based on a dataset of 628 documents published in the period 2016 to 2026, which are specifically limited to publications related to the EU, North America, and Asia. The documents come from a total of 311 sources and include 36,152 references. The annual growth rate of scientific production is -2.42%. This slightly negative value is mainly due to the

significant decline in 2026, which can be largely explained by incomplete indexation data and only includes a sub-segment of the year. Corrected for full years, the value would be 7.87% growth rate. Thus, including 2025, there is a clear upward trend in publication activity. The field of research is characterized by a high level of collaboration: a total of 1,835 authors is involved, with an average of 3.1 co-authors per document collaborating. The proportion of international co-authorships is 34.87%. Only 86 documents (approx. 14%) are single-authored. Many of the publications are regular journal articles (481 articles, approx. 77%), followed by 92 proceedings papers and 39 early access articles.

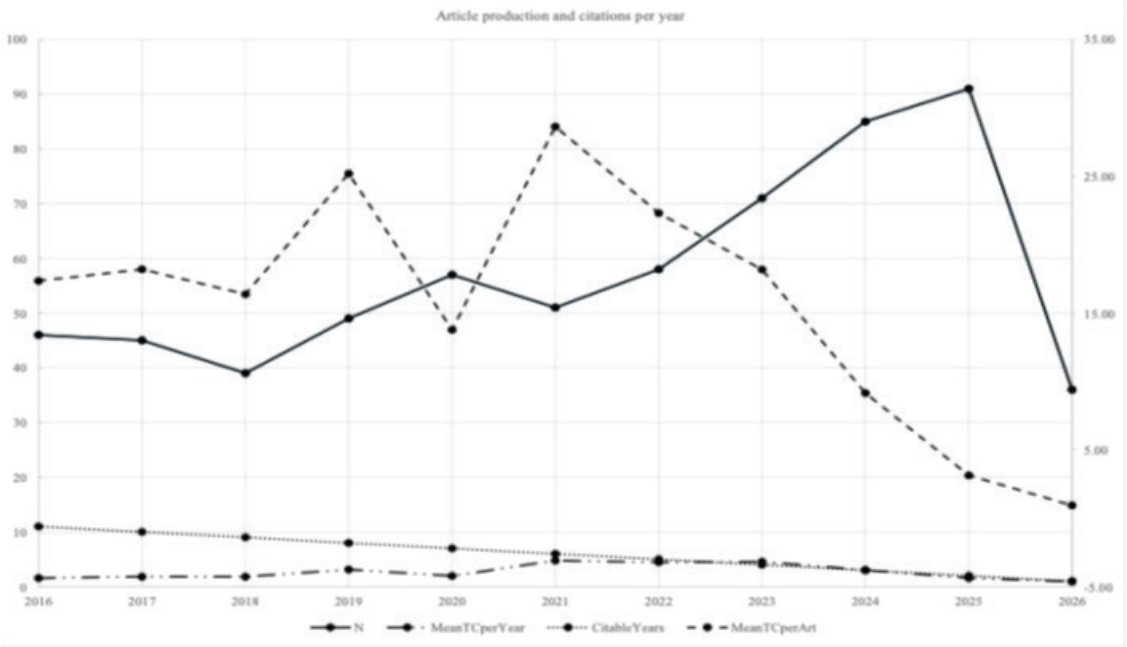
The annual scientific production provides information on how to answer RQ1 (Thematic Development and Evolution of the Research Field). Figure 2 shows a clear upward trend in the study period 2016–2026. The number of articles (N) increased from about 45 publications in 2016 to over 90 articles in 2025. The significant decline in 2026 is due to technical reasons and results from incomplete indexing data in the databases. Overall, the graph shows a continuously

growing scientific interest in the field of SMEs, innovation, performance and human resource development.

In addition to the sheer volume of publications, Figure 1 also provides important insights into the development of citations. The metrics presented can be interpreted as follows: The metrics show that the average citation intensity (MeanTCperArt and MeanTCperYear) remains relatively stable over the period, but is slightly lower in the younger years, as these articles had even less time to accumulate citations. This indicates that although the more recent literature is increasing quantitatively, it remains qualitatively (measured by reception) at a comparable level. The significant increase in the number of publications combined with a stable citation intensity underlines the growing scientific relevance of the topic. Especially since 2020–2021, an acceleration of research on SMEs, agile management practices, leadership and human resource development has been noticeable. This corresponds to current challenges such as digitalization, a shortage of skilled workers and the need for organizational agility. At the same time, however, it is evident that the explicit link between decentralized personnel development, transfer of responsibility to line managers and individualized competence development is still underrepresented in SMEs. The increasing publication activity thus creates a good basis for the present work, which addresses precisely this gap.

Figure 2. Annual Scientific Production and Citations

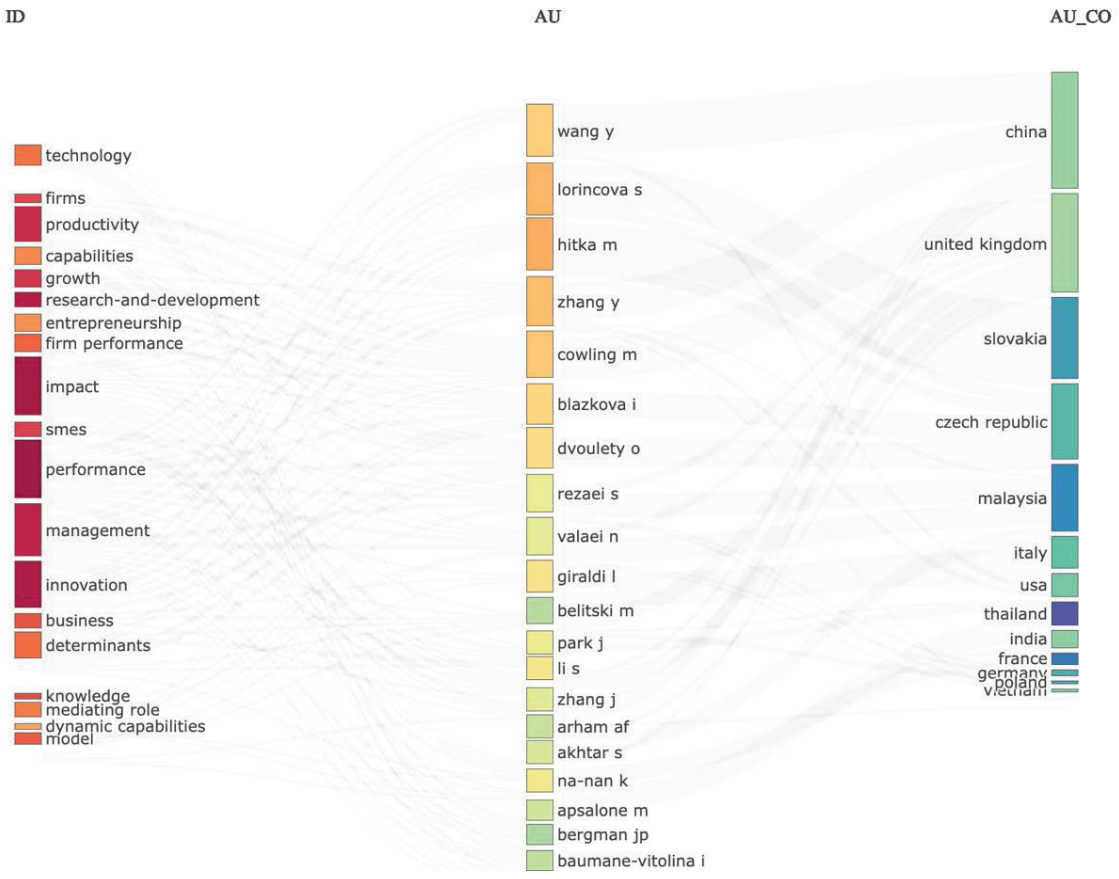


Source: Own processing following extraced data from Biblioshiny

The Three Fields Plot (Figure 3) impressively illustrates the conceptual structure and intellectual connections of the research field to personnel development and performance improvement in SMEs. On the keyword side, terms are grouped into two dominant clusters: a large orange cluster includes key concepts such as *productivity, firm performance, capabilities, growth, research-and-development, entrepreneurship, technology,* and *determinants*, while a red cluster includes topics such as *smes, performance, management, innovation, impact, business, knowledge, mediating role, dynamic capabilities*, and *model* connects (to RQ3). This structure shows that the field of research is strongly focused on the performance, innovative power and

development of dynamic skills of SMEs, with productivity- and performance-related aspects as basic themes and innovation as well as *research-and-development* as motor themes actively driving the field forward (to RQ3). On the author level, *Wang Y, Lorincova S, Hitka M, Zhang Y and Cowling M* stand out, who are linked to the key topics mentioned with a high degree of centrality and thus contribute significantly to the intellectual shaping of the field (to RQ2). At the country level, China dominates the field of research by far, followed by the *United Kingdom, Slovakia, the Czech Republic, Malaysia, Italy* and the *USA*. The strong presence of Asian and European research institutions underlines the international orientation of the literature, although clear regional focal points remain recognizable (see RQ2). Overall, the plot confirms an intensive scientific examination of the increase in productivity, innovation and competitiveness in SMEs, which is driven by technological developments, dynamic skills and management-related factors (to RQ3). At the same time, however, it becomes clear that the explicit link between decentralized personnel development, the shift of HRD responsibility to line managers as decentralized multipliers and individualized competence development in the context of organizational agility has so far only been weakly developed in this network. This conceptual gap underlines the relevance of the present work, which systematically examines precisely these relationships and thus makes an important contribution to closing the identified research gap (to RQ4).

Figure 3. Three-field plot results



Source: Own processing using Biblioshiny

Table 2 of the most prolific authors shows that the field of research is shaped by a small group of highly active researchers (on RQ2). With five articles each, *Hitka M* and *Lorincova S* as well as

Zhang Y stand out, followed by *Cowling M and Wang Y* with four publications. Particularly striking is the high fractionalized article count for *Cowling M* (2.08), which indicates a strong collaborative involvement of this author. *Blazkova I, Dvojletý O* and *Na-Nan K*, each with three contributions and in some cases high fractionalized values (up to 1.67), also underline the central role of individual researchers. These authors mainly focus on topics such as SME performance, innovation, dynamic skills and management practices in small and medium-sized enterprises (on RQ2). The concentration on a few prolific authors indicates a compact intellectual structure in which certain research groups decisively determine the agenda of the field (see RQ2). At the same time, the literature on decentralized personnel development, shifting HRD responsibility to line managers and individualized competence development in the context of organizational agility has not yet been dominated by the same central actors. This concentration of authors also has implications for further research: While the existing networks enable high productivity and thematic depth, there is a risk of limited thematic breadth. This is exactly where the present work comes in by systematically investigating the previously underrepresented relationships between decentralized HRD and agility in SMEs and thus providing an important addition to the current intellectual structure of the field (to RQ4).

Table 2. Most relevant authors

Author	Articles.	Fractionalised count
HITKA M	5	1,32
LORINCOVA S	5	1,32
ZHANG Y	5	1,58
COWLING M	4	2,08
WANG Y	4	1,12
BLAZKOVA I	3	1,50
DVOULETY O	3	1,50
GIRALDI L	3	1,03
LI S	3	1,08
NA-NAN K	3	1,67

Source: Own processing using Biblioshiny

The authorship collaboration networks (Figure 4) show a clearly fragmented structure of the research field (to RQ2). The network is not characterized by a large, contiguous component, but consists of several small, relatively dense clusters. Particularly striking is the central, strong cooperation pair between *Lorincova S* and *Hitka M*, which is highlighted by a thick connecting line and indicates an intensive, long-term cooperation. Other smaller clusters are formed around authors such as *Dukeov I, Apsalone M, Bauman-Vitolina I* and *Bergman JP (pink), Dvojletý O* and *Blazkova I (green), Valaei N* and *Rezaei S (orange)* as well as *Cowling M and Brown R (blue).* Individual weaker connections also exist with *Iqbal S / Akhtar S, Cho Y / Park J and Belitski M / Li W*. This fragmented network structure indicates that research on decentralised personnel development and agility in SMEs has so far mainly taken place in small, thematically or regionally bound research groups (see RQ2). The dominance of some networks (*e.g. Lorincova-Hitka*) shows high productivity of individual teams, but at the same time there is a lack of broad, supra-regional networking. The low density of the overall network and the many isolated or

only weakly connected nodes underline that the field does not yet seem to be characterized by large, interdisciplinary or internationally strongly intertwined collaboration structures (see RQ2). From the point of view of the conceptual structure (to RQ3), the collaboration clusters can partly be assigned to specific thematic focal points. For example, authors such as *Cowling M* are often associated with questions of productivity, innovation and dynamic skills in SMEs, while the cluster around *Lorincova* and *Hitka* seems to be strongly focused on management and performance issues in small and medium-sized enterprises. Nevertheless, the explicit link between decentralized HRD, the shift of responsibility to line managers and organizational agility remains underrepresented or not recognizable in these collaboration networks so far. Overall, the collaboration network reveals both strengths and clear gaps in the field of research (to RQ4). The existence of productive small networks allows for a high level of thematic depth, while at the same time fragmentation shows potential for future expansion through stronger international and interdisciplinary cooperation. It is precisely this gap that offers the present work the opportunity to establish new connections between decentralized personnel development and agility in SMEs and thus to thematically expand the existing collaboration patterns.

Figure 4. Affiliations

The country-specific citation analysis (Table 3) shows a clear concentration of the structure on a few research nations (to RQ2). The *UK* leads with 1,311 Total Citations (TC), followed by the *US* (933 TC) and *China* (818 TC). The average citation rate per article is dominated by the *USA* (33.30) and *Greece* (39.70), while *China* only reaches 17.40 despite a high total citation rate. *Germany* (18.70) and *France* (23.00) are in the upper midfield.

This distribution confirms the international concentration already observed in authorship and collaboration networks with high fragmentation (to RQ2). The concepts of *decentralized HRD, line manager empowerment, individualized competence development* and *organizational agility in SMEs, which are central to the present dissertation,* have so far only been marginally represented in the countries mentioned above (see RQ4).

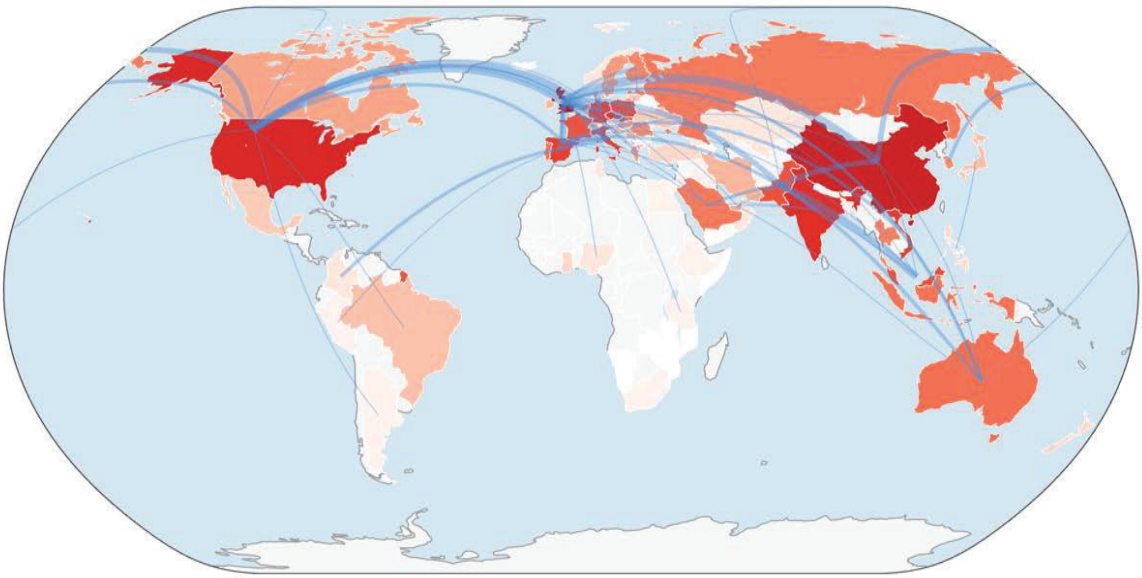
Table 3. Most cited countries

Country	TC	Average Citations
UNITED KINGDOM	1311	19,90
USA	933	33,30
CHINA	818	17,40
SPAIN	643	24,70
INDIA	446	13,50
ITALY	370	17,60
MALAYSIA	338	19,90
FRANCE	299	23,00
GERMANY	299	18,70
GREECE	279	39,90

Source: Own processing using Biblioshiny

The Country Collaboration Map in Figure 5 visualizes the international networking structure of the research field (to RQ2). Strong publication and collaboration activities (dark red) are concentrated in *the United Kingdom, the USA, China, India* as well as several European countries (*Germany, France, Italy, Spain*). The dense blue connecting lines show intensive transatlantic and Eurasian cooperation, especially between North America, Western/Central Europe and East/Southeast Asia. This distribution confirms the concentration observed in authorship and citation analysis on a few leading research nations with a high level of international networking (to RQ2). Despite excluded economic areas such as South America and Africa, as well as Oceania, there are marginal connections to them, which reinforces the restriction of the economic areas.

Figure 5. Country Collaboration Map



Source: Own processing using Biblioshiny

The table of the most productive and influential authors (Table 4) shows that the field of research is shaped by a relatively small group of highly active researchers (to RQ2). Particularly noteworthy is *Belitski M*, which has already achieved 314 total citations with only two publications, thus achieving the highest cumulative effect in the data set. *With* four publications, Wang Y has the highest g-index (4) and thus demonstrates a particularly consistent and sustainable productivity. Other authors such as *Li C, Mardani A, Wang Z* and *Zhou Z*, all of whom published in 2023, have already achieved 256 citations with one paper each, which is a sign of the high current relevance and rapid reception of more recent contributions. *Li W* and *Liu K* (both active since 2016) as well as *Ghobadian A* and *O'Regan N* complete the picture of authorship that sets both long-term and very current impulses. This concentration on a few central players with high h, g and m indices underlines a compact intellectual structure of the field (to RQ2). The authors are predominantly related to topics such as SME performance, innovation, dynamic skills and management practices in small and medium-sized enterprises. At the same time, it becomes clear that the explicit discussion of decentralized personnel development, the shift of HRD responsibility to line managers as decentralized multipliers and individualized competence development in the context of organizational agility has not yet been dominated by the same central actors.

Overall, the author table reveals both strengths and clear gaps in the field of research (to RQ4). The high productivity and citation impact of individual researchers enables thematic depth and rapid progress in core areas such as productivity and innovation. At the same time, the limited thematic breadth of the leading authors shows that the specific relationships between decentralized HRD and organizational agility remain underrepresented in SMEs so far. This gap offers the present work the opportunity to set new impulses and to expand the existing intellectual structures thematically.

Table 4. Most relevant sources

Table 5-1 of the most cited documents shows the most influential contributions in the field of research studied (on RQ2). At the top is *Li C* et al. (2023) in the Journal of Business Research with 256 global citations, followed by *Li W* (2016) with 207 citations. Other highly cited works come from *Arsawan* IWE (2022, 204 citations), *Diamantidis AD* (2019, 188 citations) and *Chowdhury* S (2022, 180 citations). The strong presence of the Journal of Business Research,

which houses several of the top 10 papers, is striking. Authors such as *Li C, Wang Y* and *Cowling M* are represented several times in this list or associated with highly cited works, which underlines their central role in the intellectual structure of the field (see RQ2).

About the conceptual structure (on RQ3), the most cited papers show a clear focus on topics such as *innovation, productivity, technology adoption, business groups* and *performance of SMEs*. Many papers examine the influence of technological changes, dynamic capabilities and strategic decisions on the performance of small and medium-sized enterprises. This confirms the central position of innovation and performance as the engine and basic themes of the research field, which is already recognizable from other analyses (to RQ3).

ID 2, (Li et al., 2016) - (TC207) investigate in a qualitative study with 42 interviews with successful European SMEs how e-leadership enables effective strategic alignment between business strategy and digital technologies and thus promotes organizational agility. Based on the Strategic Alignment Theory, they develop a model with four decision-making fields and identify central e-leadership qualities such as agile leadership, hybrid competencies, an architectural view and digital entrepreneurship. The paper shows that leadership in SMEs plays a central role in promoting organizational agility in the digital age. For the present work on the decentralization of personnel development in SMEs to promote organizational agility through individualized competence development in decentralized multipliers, this study is relevant in two respects: On the one hand, it confirms the conceptual clusters identified in RQ3 around *performance, innovation* and *dynamic capabilities*. On the other hand, it underlines the central research gap (RQ4), as Li et al. consider leadership exclusively at the top and middle management level and do not address the decentralization of HRD responsibility or the shift to line managers as decentralized multipliers. The individualization of competence development is also not considered as an independent mechanism for increasing organizational agility. Thus, the paper reinforces the gap identified in this work: While strategic e-leadership and alignment are already attracting attention in SMEs, there has been a lack of systematic discussion of the decentralization and individualization of personnel development among line managers as a concrete lever for agility and productivity increase in SMEs. The present bibliometric analysis addresses precisely this previously neglected perspective.

ID 3 (Arsawan et al., 2022) - (TC204) investigate the role of knowledge sharing in shaping an innovation culture to increase business performance and sustainable competitive advantage in a quantitative PLS-SEM study with 259 executives from 59 exporting SMEs in Bali (Indonesia). The results show that knowledge sharing has a significant positive effect on innovation culture, which in turn promotes business performance and sustainable competitive advantage; Innovation, culture and business performance act as partial mediators. The paper thus underlines the importance of knowledge exchange and innovation culture for the long-term competitiveness of SMEs and confirms the conceptual clusters identified in RQ3 around *knowledge*, *innovation*, *performance* and *competitive advantage*.

At the same time, it illustrates the central research gap of this thesis (RQ4): While Arsawan et al. While *knowledge sharing* and *innovation culture* are primarily considered at the organizational level, the decentralization of HRD responsibility, the shift to line managers as decentralized multipliers, and the individualization of competence development are completely ignored. The study sticks to a more centralized, organization-wide approach to knowledge exchange and does not address how decentralized multipliers (line managers) can promote organizational agility and sustainable competitive advantage through individualized personnel development processes. The present bibliometric analysis and the dissertation address exactly this gap by systematically investigating the decentralization and individualization of HRD among line managers as a strategic lever for agility and productivity increase in SMEs.

ID 4, (Diamantidis & Chatzoglou, 2019) - (TC188) investigate the interdependencies between firm-related and environmental factors (Management Support, Training Culture, Organizational Climate, Environmental Dynamism), job-related factors (Job Environment, Job Autonomy, Job Communication) and employee-related factors (Proactivity, Adaptability, Intrinsic Motivation, Skill Flexibility, Skill Level, Commitment) on Employee Performance. The results show that Job Environment and Management Support have the strongest direct and indirect effects on performance, while Adaptability and Intrinsic Motivation have direct positive influences; the overall model explains up to 42% of the variance of Employee Performance. For the present work on the decentralization of personnel development in SMEs to promote organizational agility through individualized competence development in decentralized multipliers, this study is relevant in two respects: On the one hand, it confirms the conceptual clusters identified in RQ3 around *performance*, *management support*, *job environment* and *adaptability/proactivity*. On the other hand, it underlines the central research gap (RQ4), since Diamantidis and Chatzoglou emphasize the influence of management support and job environment, but consider them exclusively at the central organizational level. Neither the shift of HRD responsibility to line managers as decentralized multipliers, nor the individualization of competence development or its contribution to organizational agility in SMEs are discussed. Thus, the paper reinforces the gap identified in this thesis: While central factors of employee performance are already well researched, a systematic examination of the decentralization and individualization of personnel development among line managers as a concrete lever for agility and productivity increase in SMEs is missing. The present bibliometric analysis addresses precisely this previously neglected perspective.

ID 7 (Hervas-Oliver et al., 2021)- (TC153) use 3,867 innovative SMEs from the Spanish CIS to investigate how different technological innovation typologies (pure product vs. pure process innovation) are related to specific inbound open innovation strategies and combinations of internal and external knowledge sources. The results show clearly differentiated patterns: product-oriented SMEs rely more on internal R&D and market knowledge (customers), while process-oriented SMEs hardly conduct any internal R&D and primarily rely on embodied knowledge from suppliers and equipment.

For the present work on the decentralization of personnel development in SMEs to promote organizational agility through individualized competence development in decentralized

multipliers, this study is relevant in two respects: On the one hand, it confirms the conceptual clusters identified in RQ3 around *open innovation*, *knowledge sourcing* and *SME heterogeneity*. On the other hand, it illustrates the central research gap (RQ4), since Hervas-Oliver et al. work out differentiated innovation strategies in SMEs, but do not address the decentralization of HRD responsibility, nor the shift to line managers as decentralized multipliers, nor the individualization of competence development as a lever for organizational agility. The present bibliometric analysis addresses precisely this previously neglected perspective.

ID 8, (Ballestar et al., 2020) - (TC128) analyze the relationship between knowledge flows (R&D, innovation, ICT), industrial robotics and labour productivity on the basis of 1,515 and 1,380 Spanish manufacturing SMEs (2008/2015). The results show that robotics is associated with higher productivity (+5% in 2015 vs. +2% in 2008), employment and knowledge-intensive processes; between 2008 and 2015, the explanatory model of productivity shifts towards multi-factorial components (knowledge flows, robotics, human capital), with robotized SMEs creating new complementarities between knowledge spillovers, capital deepening and exports.

For the present work on the decentralization of personnel development in SMEs to promote organizational agility through individualized competence development in decentralized multipliers, this study is relevant in two respects: On the one hand, it confirms the conceptual clusters identified in RQ3 around *knowledge flows*, *robotics/automation* and *productivity*. On the other hand, it underlines the central research gap (RQ4), as Ballestar et al. consider robotics and knowledge flows exclusively at the central organizational level and do not address the decentralization of HRD responsibility, nor the shift to line managers as decentralized multipliers, nor the individualization of competence development as a lever for organizational agility. The present bibliometric analysis addresses precisely this previously neglected perspective.

ID 9, (Kucharska & Kowalczyk, 2019) - (TC131) examine the relationship between corporate culture (Hofstede's five dimensions), CSR practice, corporate reputation and performance from the perspective of 539 employees of Polish construction companies (including SMEs). The results show that *long-term orientation* exerts the strongest positive influence on CSR practice, while *masculinity* and *power distance* have a negative effect; *Uncertainty Avoidance* and *Collectivism* remain insignificant. Corporate reputation acts as a strong mediator between CSR and performance. For the present work on the decentralization of personnel development in SMEs to promote organizational agility through individualized competence development among decentralized multipliers, this study is relevant in two respects: On the one hand, it confirms the conceptual clusters identified in RQ3 around *organizational culture*, *CSR practice*, *reputation* and *performance* as well as the strong influence of long-term orientation on sustainable practices. On the other hand, it underlines the central research gap (RQ4): While Kucharska and Kowalczyk look at CSR at the organizational level and from the employee's point of view, the decentralization of HRD responsibility, the shift to line managers as decentralized multipliers, and the individualization of competence development as a lever for organizational agility are completely ignored. The present bibliometric analysis addresses precisely this previously neglected perspective.

ID 10, (Nordhagen et al., 2021) - (TC115) analyze the immediate impact of COVID-19 by means of a survey of 367 agri-food MSMEs in 17 LMICs (Africa/Asia, May 2020). 94% of the farms reported severe disruptions (especially sales declines, access problems to inputs/financing); 84% reduced production, over 50% adjusted prices. Companies with low turnover were particularly vulnerable; younger and smaller companies showed higher resilience in some cases. Many adapted supply chains or explored new business areas. For the present work, the study confirms RQ3 clusters on *SME resilience*, *supply chain disruptions* and *crisis adaptation*. It illustrates the RQ4 research gap: While operational and logistical vulnerabilities of SMEs are addressed, decentralization of personnel development, shift to line managers as decentralized

multipliers, and individualized competence development as levers for organizational agility in crises are not taken into account.

The Word-Cloud (Figure 6) of keywords illustrates the conceptual core structure of the research field (to RQ3). By far the most prominent and largest terms are *performance, smes, innovation, productivity, management, research-and-development, impact, growth, business, firm performance, dynamic capabilities, technology, leadership, knowledge, capabilities, entrepreneurship and mediating role*. This frequency distribution confirms the conceptual structure already recognizable in the Thematic Map and the Three Fields Plot: The field is strongly focused on performance, *productivity, growth*, innovation, *research-and-development*, and the management of small and medium-sized enterprises (*smes, management, business*) (see RQ3).

The high presence of *dynamic capabilities, technology, digital transformation* and *knowledge* signals an increasing focus on adaptive, technologically supported and knowledge-based development processes in SMEs. At the same time, terms such as *leadership, human-resource management and mediating role* point to the importance of leadership and HR practices. Nevertheless, the explicit thematization of *decentralized HRD, line managers* as decentralized multipliers, *individualized competence development* and *organizational agility is* only weakly or not at all represented in the Word Cloud (see RQ4).

Overall, the Word Cloud underlines the central position of performance, innovation and SME-specific management and development issues in the literature corpus. The conceptual gap in the field of decentralized and individualized personnel development in the context of organizational agility is also clearly visible here and underpins the relevance of the present work, which systematically examines precisely these relationships and thus makes an important contribution to closing the identified research gap (to RQ4).

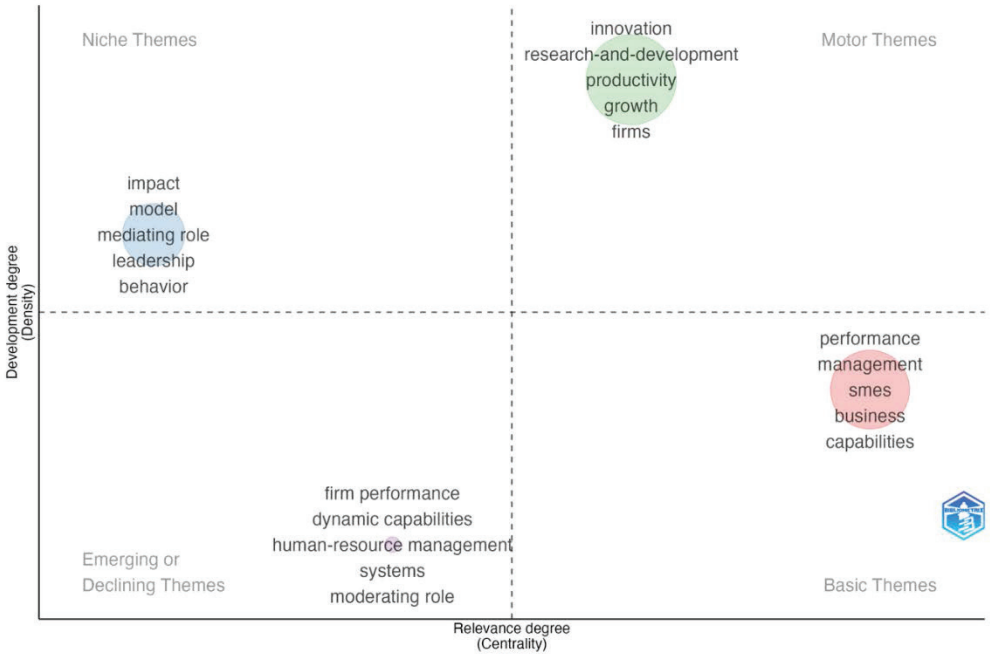
Figure 6. Wordcloud

Source: Own processing using Biblioshiny

The thematic map (Figure 7) illustrates the conceptual structure of the research field in a clear way (to RQ3). In the upper right quadrant (*Motor Themes*) are grouped highly centered and dense topics such as *innovation, research-and-development, productivity, growth and firms*. These clusters are actively driving the entire field forward and show that innovation and productivity

enhancement in SMEs are currently the most dynamic and influential areas of research. In the lower right quadrant (*Basic Themes*), *performance, management, smes, business and capabilities* form the stable foundation of the literature. These themes, although central, are less dynamic and constitute the basic conceptual framework within which most studies on SMEs are located (on RQ3). In the upper left quadrant (*Niche Themes*) you will find specialized topics such as *impact, model, mediating role, leadership* and *behavior*. Although these areas are dense, they tend to be peripheral and have so far only been intensively worked on by smaller research groups. Finally, the lower left quadrant (*Emerging or Declining Themes*) contains firm *performance, dynamic capabilities, human-resource management, systems,* and *moderating role*. These themes show low centrality and indicate emerging or declining developments (to RQ3). Overall, the Thematic Map confirms a strong focus of the field on performance, innovation and management practices in SMEs, with *performance* and *innovation* forming the central poles (to RQ2). At the same time, however, it becomes clear that the explicit link between decentralized personnel development, the shift of HRD responsibility to line managers as decentralized multipliers and individualized competence development in the context of organizational agility does not occupy a prominent position in any of the four quadrants. Neither in the Motor Themes nor in the Basic Themes can these concepts be found as central nodes (to RQ4).

Figure 7. Thematic map



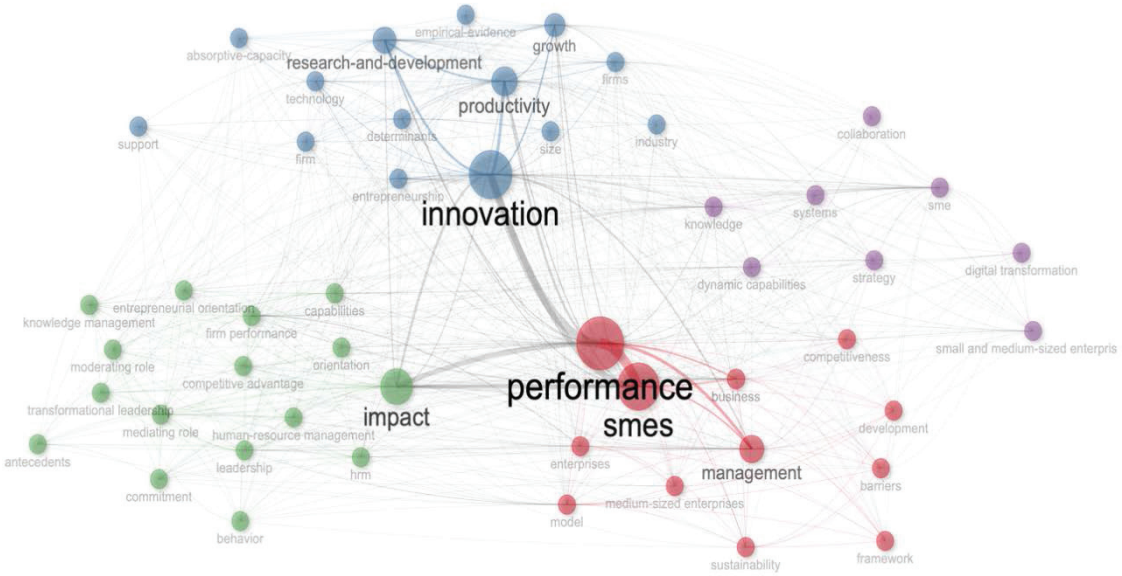
Source: Own processing using Biblioshiny

The co-occurrence network (Figure 8) of the keywords reveals the thematic connections and the conceptual core structure of the research field with high precision (to RQ3). At the center of the network are the two dominant nodes, *performance and smes*, which are connected by particularly strong and dense edges as well as to numerous other terms. This central position underlines that performance and SME-specific issues form the actual core of the literature. From this center there are intensive connections to *innovation*, *management*, *business*, *growth*, *productivity* and *research-and-development*. Particularly striking is the big blue node *innovation*,

which forms its own, highly networked sub-network with *research-and-development*, *productivity*, *growth*, *firms*, *technology* and *determinants* and thus represents the driving force of the entire field (to RQ3). Another clearly definable green cluster on the left combines impact with human resource management, *leadership*, *mediating role*, *transformational leadership*, *behavior*, *commitment* and *moderating role*. This cluster shows that HR-related and leadership-related topics are present but are more likely to be understood as mediators or moderators of the performance and innovation processes. On the right side of the network, there are further sub-clusters on *dynamic capabilities*, *digital transformation*, *competitiveness*, *strategy*, *barriers* and *framework*, which point to an increasing consideration of adaptive and technological aspects in SMEs (to RQ3). From the point of view of the intellectual structure (on RQ2), the network confirms the concentration on a few central topics and authors who use these keyword combinations particularly frequently, which was already evident in earlier analyses. The strong networking between performance, *smes* and *innovation* is also reflected in the high citation and publication activity of the leading researchers. At the same time, a clear conceptual gap becomes apparent in the co-occurrence analysis (to RQ4): The explicit link between *decentralized HRD*, *line managers* as decentralized multipliers, *individualized competence* development and organizational *agility* either does not appear at all or only in very peripheral, weakly networked positions. So far, these concepts have not been strongly linked to either the central performance-smes-innovation cluster or the HR/leadership sub-cluster. The literature treats HR practices as mediators, but almost exclusively in the context of centralized or standardized approaches.

Overall, the Co-occurrence Network shows both the high thematic coherence and the limitations of the current field of research: While the literature shows a dense and robust network in the area of SME performance, innovation and dynamic skills, the specific relationship between decentralized personnel development, transfer of responsibility to managers and organizational agility has so far been underrepresented. This gap underlines the scientific relevance of the present work, which systematically brings together precisely these previously weakly networked concepts and thus makes an important contribution to the further development of the field (to RQ4).

Figure 8. Co-occurrence network



Source: Own processing using Biblioshiny

The Conceptual Structure Map (Figure 9), which is based on a factor analysis (Multiple Correspondence Analysis; MCA), visualizes the conceptual structure of the research field in a two-dimensional representation (to RQ3). On the first dimension (Dim 1), three clearly definable clusters can be identified. The left blue cluster (negative values on Dim 1) groups topics such as *research-and-development, absorptive-capacity, firm, productivity and competitiveness*. This area represents a technologically and innovation-driven strand of literature that focuses heavily on the absorption of knowledge and the competitiveness of companies.

In the central red cluster, which extends around the zero point of the first dimension, the terms *smes, performance, innovation, firms, management, business, dynamic capabilities, model, barriers* and *development* dominate. This cluster forms the conceptual core of the entire field and confirms the central position of performance, innovation and management practices in SMEs, which is already evident in the WordCloud and the Co-occurrence Network (see RQ3). The close spatial proximity of *smes*, *performance* and *innovation* underlines that these topics not only often occur together, but are also closely interwoven conceptually.

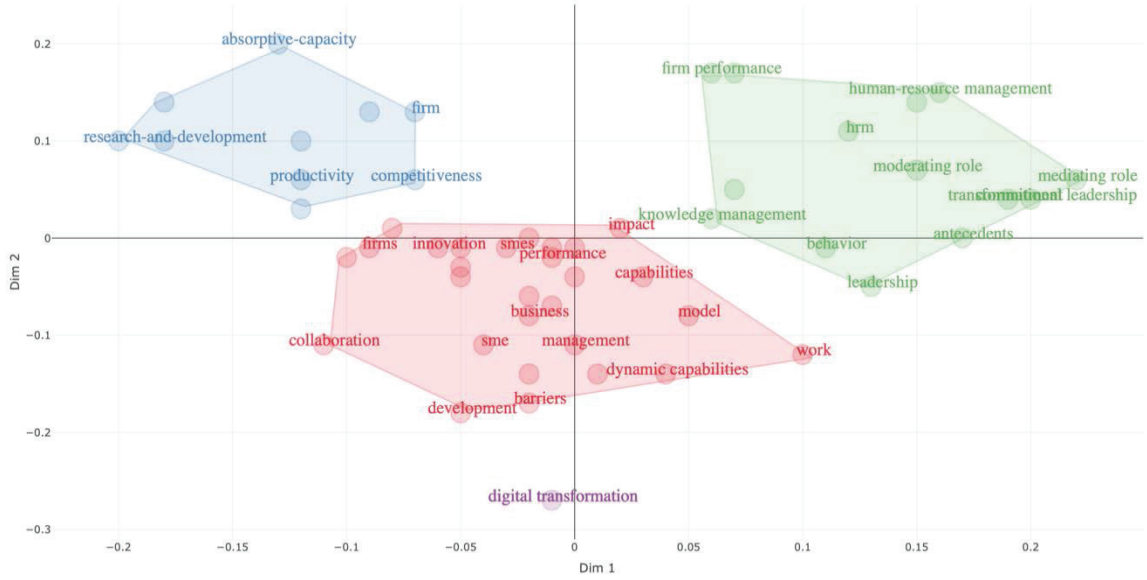
On the right side (positive values on Dim 1) is a green cluster grouped around *firm performance, human-resource management, hrm, moderating role, mediating role, transformational leadership, leadership, behavior* and antecedents. This cluster represents the HR and leadership-related strand of the literature and shows that personnel development and leadership are primarily understood as moderators or mediators of corporate performance (see RQ3).

Overall, the Conceptual Structure Map confirms a clear division of the field: On the one hand, an innovation- and productivity-oriented pole (left side), on the other hand, a *performance*- and HR-oriented pole (right side), with the central red cluster connecting both poles (to RQ2). At the same time, a clear conceptual gap becomes visible (to RQ4): The specific concepts of decentralized HRD, line managers as decentralized multipliers, individualized competence development and organizational agility are not prominently represented in any of the three clusters. Neither in the innovation-driven nor in the HR/leadership cluster are these terms found in a central position. The literature treats HR practices as mediators or facilitators, but almost exclusively in the context of traditional or centrally organized approaches.

This clear positioning of the topics in factor analysis underlines the scientific relevance of the present work. By systematically bringing together the previously weakly networked concepts of decentralized personnel development and organizational agility, she closes a central gap in the conceptual structure of the research field and expands the existing intellectual structures (to RQ4).

This clear positioning of the topics in factor analysis underlines the scientific relevance of the present work. By systematically bringing together the previously weakly networked concepts of decentralized personnel development and organizational agility, she closes a central gap in the conceptual structure of the research field and expands the existing intellectual structures (to RQ4).

Figure 9. Factorial analysis



Source: Own processing using Biblioshiny

The Trend Topics analysis (Figure 10) shows the development of the central keywords over time and thus illustrates the thematic evolution of the research field (to RQ1). By 2020, terms such as *small and medium enterprises, firm growth, organizational innovation, technical efficiency, and exploitation will dominate*. From 2020 onwards, the focus will shift towards *sme, entrepreneurship, knowledge and research and development*. From 2022 onwards, *performance, innovation, productivity, impact,*and *smes* will become increasingly important. Since 2023/2024, there has been a clear upward trend in *digital transformation, dynamic capabilities, sustainability, framework, and pls-sem*, which will have the highest term frequency by 2026 (to RQ1).

This development confirms the conceptual structure identified in the MCA and co-occurrence analysis (to RQ3): The field is moving from an early, rather static SME and growth focus to dynamic, adaptive and technologically supported concepts. The intellectual structure continues to be shaped by a few highly productive authors and countries (especially China and the UK) (see RQ2).

At the same time, the trend analysis reveals a persistent conceptual gap (to RQ4): The terms *decentralized HRD, line manager empowerment, individualized competence development* and *organizational agility, which are central to the present work,* do not appear or only peripherally appear during the entire period. Although the literature increasingly addresses HR issues as mediators of performance and innovation, it is almost exclusively in the context of central or standardized approaches. This gap underlines the scientific contribution of the dissertation, which systematically examines precisely these previously underrepresented relationships.

Figure 10. Trends of topics by keywords

5. Discussion

The present bibliometric analysis of 628 documents (2016–2026) from Scopus and Web of Science provides a comprehensive picture of current research on personnel development, performance improvement, and innovation in SMEs and enables a direct location of the dissertation topic.

For RQ1, the Trend Topics and Annual Scientific Production analysis shows a clear upward trend in publication activity until 2025, followed by a shift towards dynamic and technologically driven concepts. While small and medium enterprises, firm growth and organizational innovation dominated until 2020, performance, innovation, productivity gained in importance from 2022 onwards and, since 2023/2024, digital transformation, dynamic capabilities, sustainability and framework. This development reflects the increasing relevance of adaptive and agile management approaches, but only partially corresponds to the decentralized and individualized personnel development focused on in the dissertation.

For RQ2, the authorship, collaboration, and country analyses confirm a compact intellectual structure. A small group of highly prolific authors (notably Hitka M, Lorincova S, Wang Y) and a few countries (UK, USA, China) dominate both publication and citation output. The collaboration networks prove to be fragmented and consist mainly of small dyads and regionally bound clusters. Although this concentration allows for thematic depth, it limits the breadth of research and makes it difficult to integrate new perspectives such as the decentralised shift of responsibility to line managers.

For RQ3, the Co-occurrence Network, Thematic Map, WordCloud and Conceptual Structure Map (MCA) reveal a clear conceptual division of the field. The focus is on a stable performance–smes–innovation cluster, which is supplemented by dynamic capabilities, management and research-and-development (motor and basic themes). HR and leadership topics (human-resource management, leadership, mediating/moderating role) appear only as mediators or moderators of corporate performance, but not as independent, decentralized design elements. The factor

analysis confirms this structure by three distinct clusters: an innovation- and knowledge-based pole, a central performance-oriented core and an HR/management pole.

Regarding RQ4, the central research gap is clearly apparent: The concepts of decentralized HRD, line manager empowerment, individualized competence development and organizational agility, which are central to the dissertation, are not prominently represented in the entire literature corpus either in the Motor Themes or in the Basic Themes. They either do not appear at all or only peripherally. Although the literature increasingly treats HR practices as mediators of performance and innovation, it is almost exclusively in the context of centralized or standardized approaches. As a result, there has been a lack of systematic empirical and conceptual discussion of the shift of personnel development responsibility to decentralised multipliers in SMEs and their contribution to organisational agility.

The results thus underline the high relevance of the present work. By systematically closing the identified gap, it not only contributes to the further development of the bibliometrically mapped literature but also provides a theoretical and practical contribution for SMEs that want to implement agility-promoting personnel development under resource constraints. Future research should conduct longitudinal and empirical studies on decentralised HRD models in SMEs to causally validate the relationships shown here.

6. Conclusion

The field has developed thematically from static SME growth and innovation approaches to dynamic, adaptive and technologically supported concepts (RQ1). The intellectual structure is shaped by a small group of highly productive authors and a few dominant countries (UK, USA, China), with collaboration networks remaining fragmented (RQ2). Conceptually, a stable performance–smes–innovation cluster dominates, supplemented by dynamic capabilities; HR issues only act as mediators (RQ3).

The central research gap lies in the fact that the concepts of *decentralized HRD*, *line manager empowerment*, *individualized competence development* and *organizational agility*, which are central to this dissertation, are not prominently represented in either the motor or basic topics in the entire literature corpus (RQ4). This thesis closes this gap by systematically investigating the decentralization of personnel development as a strategic lever of organizational agility in SMEs. It thus combines two previously separate research strands and provides both a theoretical contribution to the dynamic capabilities' perspective and a practice-relevant approach for resource-constrained SMEs. Future research should conduct empirical studies to causally validate the effect of decentralized HRD models on agility and productivity. The dissertation thus makes an independent and relevant contribution to management research.

*5.1 Concrete Managerial Implications:*The bibliometric analysis shows that decentralized and individualized personnel development in SMEs has so far represented a clear research gap, although it holds considerable potential for organizational agility and productivity increase. For SME managers, this results in the following concrete recommendations for action:

1) Strengthen line managers as decentralized HRD multipliers: Instead of centralized personnel development programs, companies should systematically enable line managers to take over individual competence development of their employees. This can be done through short train-the-trainer modules and clear decision-making powers (e.g. budget for individual training).

2) Introduce individualized competence development: Instead of standardized training, SMEs should focus on needs-oriented, personalized learning paths, e.g. through mentoring tandems,

micro-learning, e-learning and regular structured and systematic competence feedback meetings between line managers and employees, also by means of information technology support.

3) Increase organizational agility through decentralized HRD: Shifting HRD responsibility to line managers shortens decision-making paths and enables faster adaptation to market changes. SMEs should support this through agile HR processes (e.g. quarterly competence checks).

4) Ensure measurement and proof of success: Simple metrics such as employee engagement, time-to-productivity of new competencies, and organizational agility indicators (e.g., response time to change) should be tracked regularly to prove the ROI of decentralized HRD, as well as HRD-specific employee and company metrics.

These measures are resource-saving, can be implemented directly and address precisely the connections that have been neglected in the literature so far. SMEs can thus realize competitive advantages through higher agility and productivity without having to rely on complex central HR structures. The addition of information systems in particular gives SMEs enormous potential to save resources while improving productivity and agility.

*5.2 Limitations of the Analysis:*The present bibliometric analysis is subject to several methodological and data-related limitations. The dataset is based exclusively on Web of Science as well as on English-language publications from EU, North American and Asian countries. As a result, relevant papers in other languages or from other regions are systematically excluded. The search string is not free of false negatives despite careful Boolean construction; some specific studies on decentralized HRD may not have been recorded, despite broad keyword coverage. The bibliometric method per se is quantitative and does not allow a qualitative assessment of the depth of content or methodologies of the studies included. While the analysis identifies thematic clusters and gaps, it cannot assess causal relationships or the actual quality of research results. In addition, the period 2016-2026 is characterized by incomplete indexation data for 2026, which explains the negative annual growth rate and allows for a slight distortion of recent trends.

Although all documents were screened, the interpretation of the visualizations (Co-occurrence Network, Thematic Map, MCA) is limited to the metadata generated in Bibliometrix/Biblioshiny. A complete full-text analysis of all 628 documents was outside the scope of this work. Despite these limitations, the study provides a robust, systematic mapping of the current state of research and clearly identifies the research gap relevant to the dissertation. The results are therefore to be understood as a starting point for further empirical investigations.

5.3 Suggestions for Future Research: The present bibliometric analysis has identified a clear conceptual and empirical gap in the field of decentralized and individualized personnel development in SMEs. Future research should close this gap through empirical studies that systematically investigate the effect of shifting HRD responsibility to line managers as decentralized multipliers on organizational agility, skill development, and productivity.

Overall, the research gap identified here offers a large field for empirical and theoretical developments that are highly relevant for both science and practice and offers potential for interdisciplinary approaches for further research to expand them with practical models for decentralized HRD.

Abstract

Governments worldwide embraced the digitalization revolution through GovTech implementation reforms to deliver public services faster and more transparently, responding to their citizens' needs and enhancing citizen engagement in decision-making. Modernization of public services requires full engagement of all stakeholders in an economy, where citizens and Civil Society Organizations play a key role. With the digitalization of governments conforming to global trends of digital economies and the demand of their citizens for digital public services, there is a need for research in this topic. This paper presents findings related to the impact of GovTech on citizen engagement. The focus of this research is Western Balkan countries as candidate countries in the EU family. To come up with the main findings, a combination of descriptive and comparative analyses based on secondary data was used, extracted by the World Bank's GovTech Maturity Index (GTMI 2020, 2022, and 2025). This paper contributes to digital citizen engagement literature. It concluded a positive relationship between GovTech maturity and digital citizen engagement, and it demonstrated a positive correlation between the GovTech advancements and citizen engagement across the region. Governments must aim for the EU family to consider building strategies with a focus on citizens' digital literacy and engagement in decision-making.

Keywords:*GovTech, Citizen Engagement, Digital Transformation, government systems, digital platforms*

Jel Code: H10, H11, O33

1. Introduction

The digital revolution has changed the traditional model of citizen engagement, which was mostly through voting and public consultations. Government digitalization through GovTech platforms has transformed public administration, public services, public finances, and public participation, enhancing interaction between the two main actors in the country's economy: the government and its citizens. Through these changes, active citizen engagement is prioritized in having easy access to public finances and justice, giving timely feedback to different issues, getting public services with higher transparency, and having better monitoring processes with the final purpose of building strong relationships between citizens and government. In developing countries, governments are investing and building long-term strategies in the digital infrastructure of public administration resources and services, which is essential for enhancing citizen engagement and ensuring that these investments lead to meaningful participation in governance. When citizens are actively engaged in the Public Financial Management cycle, they can help shape budget decisions, improve inclusiveness, and ensure that public resources respond better to the needs of vulnerable groups, especially when engagement goes beyond simply sharing information and builds real understanding of the budget on both sides (Kumagai et al., 2019). Understanding the actual and future impact of these technologies on citizen engagement has become a priority field of research for economists, policymakers, and researchers. Despite the positive impact of GovTech on citizen engagement presented in the literature review, a critical gap remains in better understanding this relationship when

comparing Western Balkan countries that aspire to integration in the EU. This paper attempts to fill this gap in literature by using GovTech Maturity Index (GTMI) data to compare and analyze the importance of GovTech platforms in improving citizen engagement throughout WB countries. This paper is organized into five sections. In the second section an overall relevant literature on GovTech and citizen engagement, background theory, and empirical aspects is presented. In section 3 the methodology is outlined. To continue, section 4, where analytical results are described and findings are discussed, and section 6 present the main conclusions and recommendations to be followed.

2. Literature Review

This section encompasses a general literature review on digitalization of citizen engagement and the role that GovTech developments have played in citizen engagement. Theories of digital democracy propose that digital technologies transform political communication by allowing more interactive forms of citizen engagement and by enhancing government accountability (Chadwick, 2013). However, early and ongoing challenges related to e-government services and citizens' engagement require profound analysis. Ferro et al. (2013) identified the main challenges in the public sector digital area as digital gaps, limitations of trust in government platforms, and changing of the citizens' expectations over time. The OECD (2014) recommendation on digital government redefined the government's mission of modernization and changed the direction of global conversation by going beyond traditional e-government into a new data-driven public sector as a strategic asset, putting citizens at the center of every decision. Lee & Kwak (2012) and Bolívar (2015) demonstrated that the appropriate communication and the undertaking of government efforts can enhance the levels and effectiveness of citizen engagement, particularly by addressing the identified challenges such as digital gaps and trust issues, which are crucial for fostering a more inclusive and participatory digital environment. Medaglia (2012) and Zuiderwijk et al. (2015) emphasized the need for building inclusive digital strategies, enhancing the public feedback, and providing training to citizens on how to effectively use public digital platforms. With the digital strategies in place and improvement of digital platforms, citizen engagement started to enhance. David (2018) and Kumagai et al. (2020) emphasized that digital government platforms can enhance civic engagement in democratic societies, providing more and equal opportunities for a large group of people. Citizen engagement enhances by providing transparent and universally accessible public services (Bolívar, 2015; Chatfield & Reddick, 2018).

The World Bank has helped the digitalization of governments worldwide. In 2019 it started to implement a modern approach GovTech initiative, which put countries to public sector remodulation towards economy and digital transformation. GovTech encloses all digital platforms used in the public sector, aiming to improve accessibility, efficiency, and transparency (OECD, 2024; World Bank, 2025). The World Bank (2023) defines citizen engagement as a long-term relationship among citizens and governments, which includes activities that allow citizens to intervene in policies and projects with effect in their communities, be heard by government, and strengthen their abilities in taking better decisions. With the digital revolution in the government area, the concept of citizen engagement has been developed into digital citizen engagement, which is conceptualized as online public participation, digital feedback platforms, and online consultations that enable citizens to intervene in decision-making, drafting policies, and delivery of public services (OECD, 2025). The World Bank (2023) and OECD (2025) founded a positive relationship through GovTech and citizen engagement, having a stronger effect in countries with robust digital infrastructure and effective institutions. However, the relationship between digital platforms and effective citizen engagement is more complex. Some critics are concerned about superficial and artificial inclusion, digital divides, privacy, and asymmetries (Dijk et al., 2003 and Benlahcene et al., 2024). The same concerns were brought up by Zhou et al.

(2025) on GovTech, stressing transparency and social context issues in digital engagement platforms. In contrast to this, Gunasilan (2024) concluded that digitalization has enhanced the public service delivery and citizen trust in government. Schmidthuber et al. (2023) highlighted that public trust is higher when governments are transparent and use web platforms. The citizens' readiness to interact with government digitally is influenced not solely by digital access, but also by their trust in public institutions (Norris, 2011; Welch et al., 2005), digital literacy, and inclusivity (OECD, 2025). The World Bank (2025) further emphasized that effective citizen engagement depends on the willingness and capability of both governments and citizens to participate. Digital literacy has identified additional costs for citizens and governments (Peeters, 2023), which can hinder their ability to participate effectively in governance platforms and limit overall citizen engagement. De Marco (2021) concluded that citizens' engagement is more effective when there exists a high level of digital literacy and economic and educational status. According to Diakite et al. (2024), GovTech platforms have a higher positive impact on citizen engagement and are more effective in developing countries compared to low-income countries.

3. Methodology

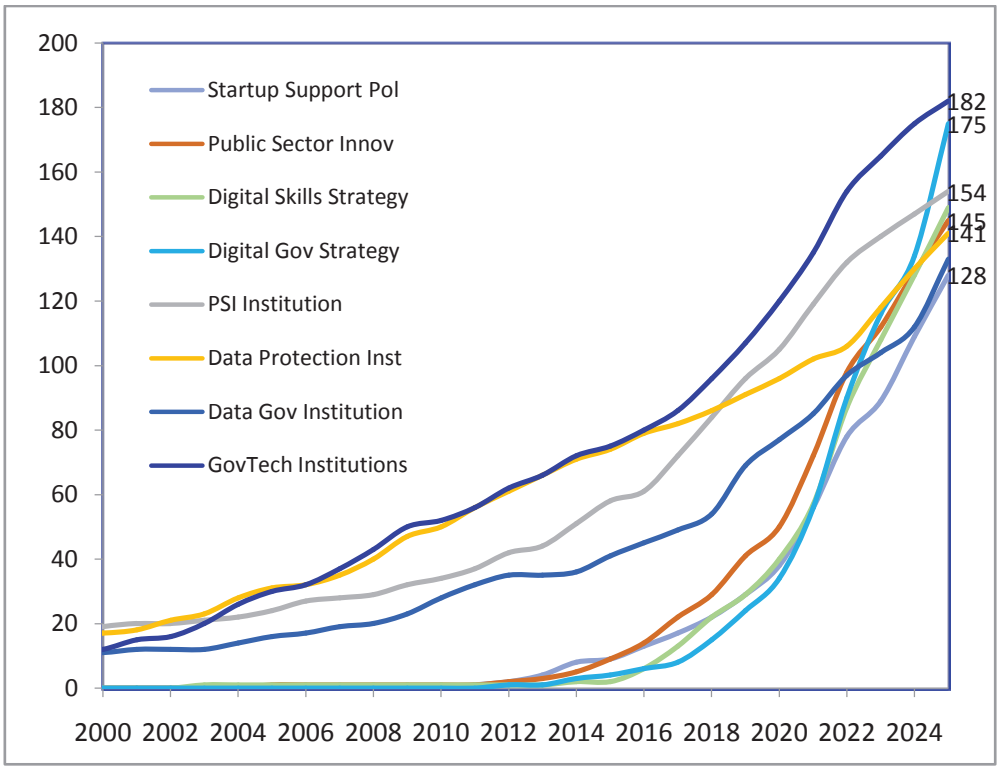
This study uses a descriptive and comparative analysis based on country-level secondary data during 2020-2025. The World Bank GovTech Maturity Index (GTMI) 2020/2022/2025 is the main source of data. The analysis includes Western Balkan countries (Albania, Bosnia and Herzegovina, Kosovo, Montenegro, North Macedonia, and Serbia). The GovTech Maturity Index (GTMI) launched for the first time by the World Bank in 2020 with the purpose of measuring the digital transformation of the public administrations in 198 economies, focusing on the four areas: core government systems and shared digital infrastructure (CGSI); online public-service delivery (PSDI); digital citizen engagement (DCEI); and GovTech enablers (GTEI). In this paper we have analyzed the key aspect of digital citizen engagement focus area in the Western Balkan countries, coming up with a comparative analysis between the countries. Other international reports and data from other sources are considered in this analysis too, to fully complete the big picture of the digital revolution in these countries. The following section shows an overall view of the situation of GovTech, and Digital Citizen Engagement in each of these countries by graphic illustration and result discussion of the data analyzed and described.

4. Discussion and analysis

4.1 Digital government evolution worldwide

The digital transformation of the public sector has evolved over the years, thus bringing about a transformation of the government's relationship with its citizens. This relationship is still in a transition phase and central to this digital transition has been the digital evolution in the institutional aspect, digital strategies, and other GovTech initiatives undertaken by the government. Chart no. 1 below illustrates the digitalization of government, GovTech institutions, and strategies, giving the whole picture of government institutional digital evolution at a global level, where progress and growth are clearly visible.

Graph no. 1: Digital Government and GovTech Institutions & Strategy



Source: World Bank 2025

Governments have been investing in technology to modernize the public sector. Trajectories depicted in the above graph illustrate the government digital evolution, which can be divided into three main stages:

The first stage encompasses the period 2000-2014. It marked the beginning of gradual progress of government tech enablers and the beginning of shaping the enabling conditions for digital citizen engagement. Progress in this stage was limited and mostly related to essential elements, such as GovTech institutions, data protection institutions and initial data governance institutions.

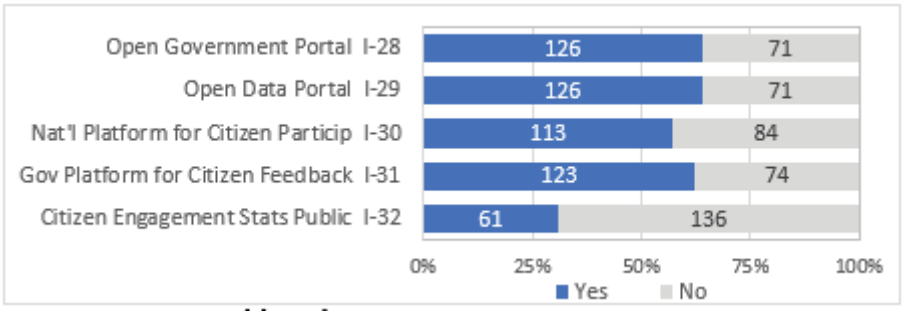
The second stage, 2015-2019, brought into light the establishment of GovTech institutions, digital government strategies, digital skills strategies, and public sector innovation frameworks. The number of published strategy documents to support the digital public administration transformation increased starting from 2015. In 2024, 175 out of the 198 surveyed countries had digital strategy documents in place. In 2019, the GovTech initiative launched by the World Bank brought an increase in intensity and progress in the public sector's digital transformation. In this worldwide initiative, a focus area was projected on the development of digital citizen engagement as a key element in assessing public sector modernization while using digital solutions. In this stage governments began to embrace digital transformation as a fundamental function of the state.

The third stage, 2020-2025, is marked as the revolution period with a high intensity of public sector digitalization. The beginning of this period, derived from a sharp acceleration of public sector digitalization, coincides with COVID 19, defined as an external shock to public sector digitalization with a critical impact worldwide. Over the past five years, developing countries have been increasingly requesting external support and increasing their investments in digital

transformation projects, particularly in response to the challenges posed by the COVID-19 pandemic and the need for more resilient public services. It brought a significant increase in demand for remote government data and service delivery, GovTech institutions, and digital strategies. The government viewed the strengthening of GovTech as an emergency, necessitating more flexible and achievable digital citizen engagement. Consolidation of digital strategies and institutions explains the improvements on the GovTech maturity index overall, which defines the preconditions for better digital citizen engagement, but still, citizen engagement tends to lag institutional development.

Word Bank through GTMI index evaluates the level of digital citizen engagement through indicators: open government portal, open data portal, national platform for citizen participation, citizen engagement statistic publication, and government platform for citizen feedback. Based on these indicators, digital engagement worldwide is presented in graph no. 2.

Graph no. 2: Digital Citizen Engagement



Source: World Bank 2025

Digital citizen engagement in 2025 is considered to have a positive result in most of the countries (126 out of 197). Even though it is assessed as the least mature GovTech component worldwide, there still are countries that have not progressed in this direction. As conclusion, we can say that GovTech initiatives have a critical role in narrowing the gap between institutions and citizens by fostering citizens' trust and their collaboration through innovative digital platforms and tools.

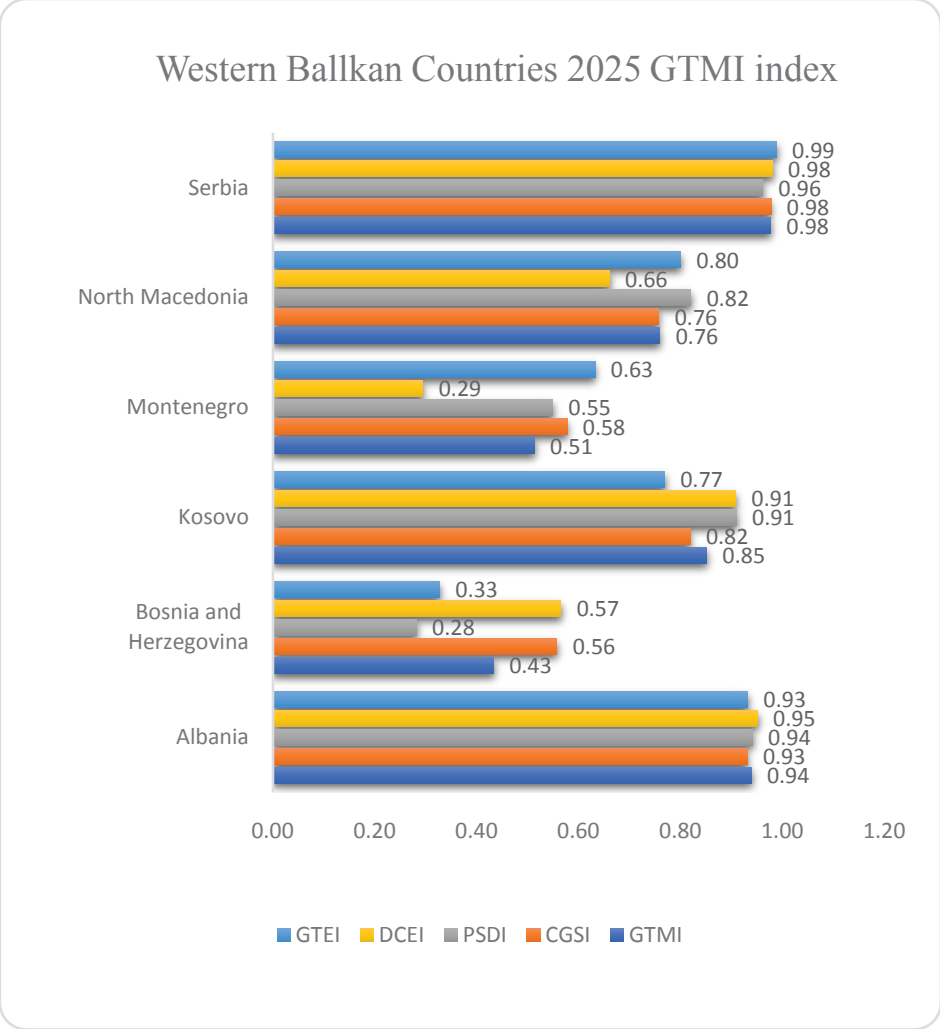
4.2 Digital government and Digital Citizen Engagement in Western Balkan Countries

The governments in the Western Balkans have invested in technological development and the digitalization of the public sector, as well as the drafting of the necessary strategic documents in this regard. A trend towards civic involvement is increasingly being observed. These countries, being aspirants to the EU, have incorporated reform agendas in their policies in line with the EU agenda, in which the element of digitalization of the public sector and society as a whole plays an important role.

Western Balkans countries show a GovTech maturity gap where countries with higher GTMI scores typically have advanced more rapidly in GovTech institutions and digital strategies. Albania, Kosovo, North Macedonia, and Serbia, according to the World Bank's GTMI 2025, are classified in Group A, showing the highest GovTech maturity tier. Montenegro is classified in Group B, and Bosnia and Herzegovina is classified in Group C, showing a weak GovTech maturity tier.

In graph no. Figure 3 presents the distribution of the main components of GovTech maturity for Western Balkan countries.

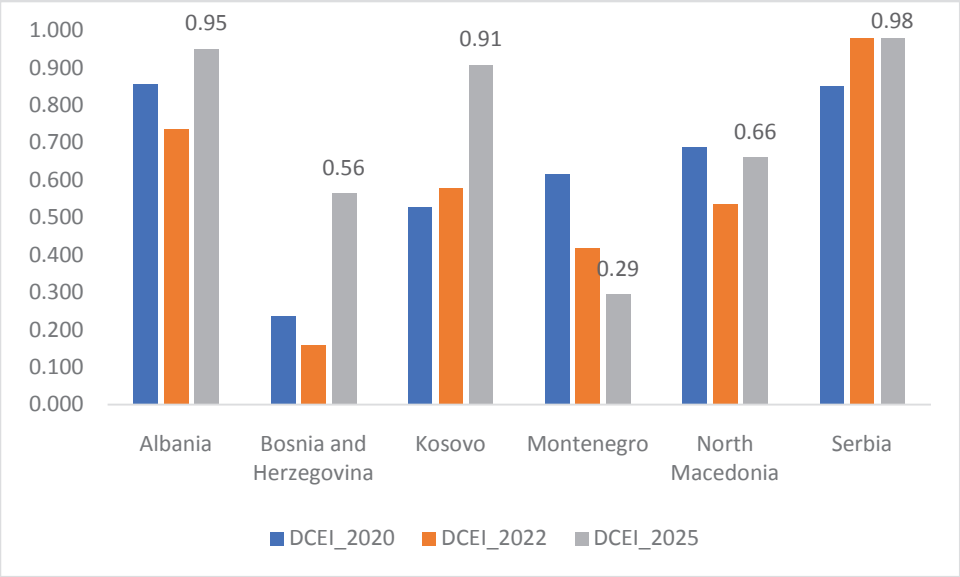
Graph no. 3: Western Balkan government digitalization 2025



Source: Author's calculations based on World Bank 2025

Albania and Serbia have a better balanced GTMI components score among other Western Balkan economies, with strong performance in four key areas: core government systems and shared digital infrastructure (CGSI) respectively 0.93 and 0.98; online public-service delivery (PSDI) respectively 0.94 and 0.96; digital citizen engagement (DCEI) respectively 0.95 and 0.98; and GovTech enablers (GTEI) respectively 0.93 and 0.99. Kosovo and North Macedonia follow, with the good levels of GTMI. Kosovo reflects higher scores on PSDI (0.91) which demonstrates a good performance in digital public service delivery, and DCEI (0.91) demonstrates high score on active digital citizen engagement and coordination. Comparing the above countries Kosovo is lagging on the development of digital government strategies, public sector Innovation, and digital Skills. Whereas North Macedonia needs to further improve the component of digital citizen engagement. Montenegro and Bosnia and Herzegovina have the lower GTMI scores with persistent gaps between institutional readiness and effective digital citizen engagement. The Digital Citizen Engagement (DCEI) component is presented in Graph no. 4. It illustrates diverging trajectories in DCEI across the six Western Balkan economies between 2020, 2022, and 2025.

Graph no. 4: Digital Citizen Engagement in Western Balkan Countries



Source: Author's calculations based on Word Bank data

Albania, Serbia, and Kosovo have the highest DCEI levels in 2025, indicating important investment in digital platforms for the delivery of public services and citizens' participation channels. The DCEI score is measured through indicators: the UN E-Participation Index, the existence of an open government website/portal, the existence of an open data portal, a citizen engagement national platform, and a citizen engagement feedback platform.

Serbia scores the highest level of digital citizen engagement among WB6 countries (0.98), with a well-developed government digital infrastructure, especially in the urban areas. Serbia scored the highest level on the e-Participation Index (0.89), followed by Albania (0.72). Serbia has an open government website (https://www.srbija.gov.rs/), which is regularly updated on a weekly or daily basis with comprehensive data catalog content, and it is regularly used. Also, there is an Open Data Portal (https://data.gov.rs/) updated automatically, with a frequency update of weekly or daily. It is widely used for access to Serbia's government data. Furthermore, the national platform (https://ekonsultacije.gov.rs/) is available for their citizens to participate in the decision-making process. Also, Serbia is the only country in WB6s that has a dedicated portal for petition (https://rsjp.gov.rs/cir/inicijative-privrede-i-gradjana/). Digital public services reach the EU average in several dimensions. But still the cybersecurity dimension remains a concern. Digital trust and cybersecurity legislation within the EU regulatory framework need to be further aligned.

Albania is the second with the highest scores on the DCEI (0.91) in the WB6, with the Open Government Portal, Open Data Portal, Citizen Engagement Statistic Publication, and Government Platform for Citizen Feedback all operational. The Open Government Portal and Open Data Portal (https://opendata.gov.al/) are frequently updated on a weekly or daily basis. Also, there is a national platform (https://www.shqiperiaqeduam.al/) for citizens to participate in policy decision-making and to give their feedback. Digital delivery of public services is done through e-Albania, which enables interoperability with several databases of government platforms and technology systems. Albania has incorporated artificial intelligence in the e-Albania portal. In this regard, on January 19, 2025, "Diella" came to life to serve Albanian citizens, with the mission of full digitalization of state documents, accessibility in public services for all its citizens, and integration of artificial intelligence in key public sectors. As main challenges for Albania to better

perform regarding digital engagement are the digital divide being present and citizens' ability to use digital public services independently.

Kosovo has made notable progress in 2025 compared with 2020 and 2022, with accelerated improvements in digital citizen engagement. There is no E-participation index available for Kosovo. Even though Kosovo has an open government website available (https://www.atk-ks.org/en/open-data/), it is annually updated with basic information content manually updated. The e-Kosova portal (https://ekosova.rks-gov.net/) offers online services. Also, Kosovo has a national platform (https://konsultimet.rks-gov.net/), which allows their citizens in policy decision-making and allows them to provide feedback on service delivery.

Based on GTMI results, Bosnia and Herzegovina and Montenegro in the report with other WB countries stand comparatively weaker with continuous gaps in translating digital government reforms into effective citizen engagement outcomes. About Bosnia and Herzegovina, digital capabilities are noticeable, especially in e-commerce and the private sector, but national-level digital transformation is constrained by a constitutional and governance structure. There are three e-government portals (instead of one) in the Federation of Bosnia and Herzegovina, Republic Srpska, and Brčko District, which operate independently, and the interoperability among them is limited. As presented in the graph above, Bosnia and Herzegovina show minimal progress since 2020 and remains in group C, with some focus on GovTech but low digital citizen engagement.

Montenegro, even though it is the most advanced country in EU accession negotiations among the WB6, has lower GovTech progress and a lower DCEI score (0.294). Montenegro still does not have an open government website/portal or a citizen engagement platform to allow citizens in decision-making or to give their feedback.

5. Conclusions

Literature review findings and analytical results provide us with a solid foundation on how citizens manifest their engagement through technology across different governance levels, economic development, and social contexts. With the growing demand for public finances and other public services to be transparent and accountable, and for citizen participation in policy decision-making, the engagement between citizens and their governments, as well as with other actors, is crucial.

Digital citizen engagement serves as a catalyst that strengthens accountability pressures and increases governments' engagement to improve public service delivery by being easily accessible, transparent, and equal to all citizens`. Findings derived from GTMI 2020-2025 data analysis for Western Balkan countries are a good reference for their governments to identify opportunities, gaps, and challenges in how they can improve their GovTech strategies compared with most well-performing countries. Also, it helps them to implement effective digital initiatives in the public sector. These findings are valuable insights for all stakeholders in the public sector who want to contribute to digital initiatives and serve as useful data for research and development in this area.

Digital citizen engagement (DCEI) in Western Balkan countries has shown progress since 2020, but still, it remains the lowest-performing component of the GovTech Maturity Index, on the same line as the worldwide DCEI level. Economies that score higher on the DCEI have better institutionalized open data, digital participation, and feedback mechanisms. In this context we can say that digital citizen engagement has the weakest performance among GovTech key areas, which is related to political and institutional restrictions, compared with countries paying more attention to technical intervention.

Findings highlight that GovTech's impact on citizen engagement is mediated by citizens' digital literacy and the adequacy of digital infrastructure.

Abstract

Inteligjenca Artificiale (IA) po shndërrohet gjithnjë e më shumë në një forcë transformuese në industrinë e turizmit, duke përmirësuar ofrimin e shërbimeve, duke optimizuar proceset operacionale dhe duke mundësuar përvoja të personalizuara për konsumatorët. Aplikacionet e bazuara në IA, si chatbot-et, sistemet e rekomandimit, analiza parashikuese dhe modelet dinamike të çmimeve, kontribuojnë në rritjen e efikasitetit dhe konkurrueshmërisë në tregun turistik. Megjithatë, integrimi i këtyre teknologjive shoqërohet me sfida të rëndësishme etike që kërkojnë vëmendje të veçantë.

Ky studim synon të analizojë sfidat etike që lidhen me përdorimin e IA në turizëm, me fokus të veçantë në privatësinë e të dhënave dhe pasojat për qëndrueshmërinë. Studimi bazohet në një qasje cilësore, përmes rishikimit sistematik të literaturës bashkëkohore shkencore dhe raporteve institucionale në fushën e etikës së IA.

Gjetjet tregojnë se, përkundër përfitimeve të shumta, përdorimi i IA sjell rreziqe të konsiderueshme, si mbledhja dhe përdorimi i paautorizuar i të dhënave, shkelja e privatësisë, njëanshmëria algoritmike dhe mungesa e transparencës në proceset e vendimmarrjes së automatizuar. Këto problematika mund të ndikojnë negativisht në besimin e konsumatorëve dhe të çojnë në rezultate diskriminuese. Gjithashtu, IA paraqet ndikime komplekse për qëndrueshmërinë, duke kontribuar njëkohësisht në optimizimin e burimeve dhe në rritjen e presioneve mjedisore.

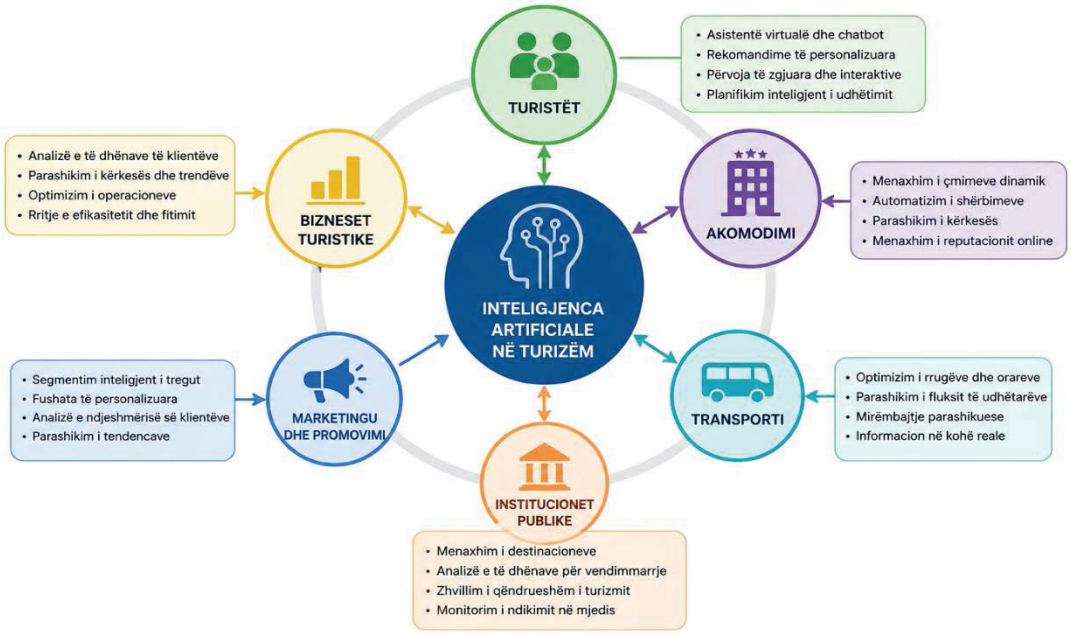
Në përfundim, studimi thekson nevojën për hartimin e kornizave të forta etike dhe rregullatore për përdorimin e përgjegjshëm të IA në turizëm, nëpërmjet bashkëpunimit ndërmjet politikëbërësve, industrisë dhe institucioneve akademike.

***Keywords**: Inteligjenca Artificiale, Turizëm, Etikë, Privatësia e të Dhënave, Paragjykimi Algoritmik, Qëndrueshmëri; Transformim Digjital.*

1. Hyrje

Industria globale e turizmit ka përjetuar një transformim të rëndësishëm digjital gjatë dekadës së fundit, duke ndryshuar mënyrën se si planifikohen, menaxhohen dhe konsumohen shërbimet turistike (Buhalis & Law, 2008). Zhvillimi i teknologjive inteligjente dhe integrimi i Inteligjencës Artificiale (IA) kanë krijuar mundësi të reja për personalizimin e eksperiencës së turistëve, optimizimin e proceseve operative dhe rritjen e konkurrueshmërisë së bizneseve turistike. Përdorimi i sistemeve inteligjente, si chatbot-et, algoritmet e rekomandimit, analiza e të dhënave në kohë reale dhe sistemet automatike të rezervimeve, ka përmirësuar ndjeshëm cilësinë e shërbimeve dhe efikasitetin organizativ (Gretzel et al., 2015). Platformat turistike përdorin algoritme inteligjente për të analizuar preferencat e konsumatorëve dhe për të ofruar produkte dhe shërbime të personalizuara.

Figura 1. Ekosistemi i Inteligjencës Artificiale në Turizëm



Burimi: Përshtatur nga Gretzel et al. (2015).

Megjithatë, zgjerimi i përdorimit të Inteligjencës Artificiale ka krijuar edhe sfida të rëndësishme etike dhe sociale. Sistemet inteligjente mbështeten në mbledhjen dhe analizimin e sasive të mëdha të të dhënave personale, gjë që ngre shqetësime serioze mbi privatësinë, transparencën dhe sigurinë e informacionit (European Commission, 2021). Për më tepër, algoritmet mund të krijojnë paragjykime diskriminuese dhe mungesë drejtësie në proceset automatike të vendimmarrjes (Floridi & Cowls, 2019). Një aspekt tjetër me rëndësi lidhet me ndikimin e IA në qëndrueshmërinë e turizmit. Nga njëra anë, IA mund të kontribuojë në optimizimin e përdorimit të energjisë, menaxhimin e flukseve turistike dhe reduktimin e ndikimeve negative mjedisore (UNWTO, 2022). Nga ana tjetër, infrastruktura digjitale dhe qendrat e mëdha të të dhënave kërkojnë konsum të lartë energjie dhe krijojnë sfida të reja ekologjike (UNEP, 2020).

Qëllimi i këtij studimi ishte të analizonte sfidat etike të përdorimit të Inteligjencës Artificiale në turizëm, me fokus në privatësinë e të dhënave, transparencën algoritmike dhe dimensionin e qëndrueshmërisë.

Studimi synoi gjithashtu të ofrojë rekomandime për përdorimin etik dhe të përgjegjshëm të IA në industrinë turistike.

2. Rishikimi i Literaturës

2.1 Inteligjenca Artificiale dhe transformimi i turizmit: Inteligjenca Artificiale përfaqëson një grup teknologjish që simulojnë procese të inteligjencës njerëzore përmes sistemeve kompjuterike. Në industrinë e turizmit, IA përdoret gjerësisht për analizimin e sjelljes së konsumatorëve, personalizimin e ofertave turistike, automatizimin e komunikimit me klientët dhe optimizimin e proceseve operacionale (Ivanov & Webster, 2019). Studimet bashkëkohore tregojnë se përdorimi i IA ka ndikuar pozitivisht në rritjen e efikasitetit operacional dhe përmirësimin e eksperiencës së turistëve (Tussyadiah, 2020). Platformat turistike online përdorin algoritme inteligjente për të analizuar preferencat e përdoruesve dhe për të sugjeruar destinacione, hotele dhe aktivitete të personalizuara. Gjithashtu, chatbot-et dhe asistentët

virtualë janë bërë pjesë integrale e sektorit turistik, duke ofruar mbështetje të vazhdueshme për klientët dhe duke reduktuar kostot operative të kompanive turistike (Zeng et al., 2020).

2.2 Privatësia e të dhënave dhe sfidat etike: Privatësia e të dhënave konsiderohet një nga sfidat më të rëndësishme etike të përdorimit të Inteligjencës Artificiale në turizëm (European Commission, 2021). Sistemet inteligjente mbështeten në mbledhjen dhe analizimin e sasive të mëdha të të dhënave personale të turistëve, duke përfshirë preferencat individuale, historikun e udhëtimeve, vendndodhjen gjeografike dhe sjelljen online. Rreziku kryesor lidhet me mungesën e transparencës mbi mënyrën se si të dhënat ruhen, përpunohen dhe shpërndahen nga kompanitë turistike. Shpesh, përdoruesit nuk janë plotësisht të informuar mbi përdorimin e informacionit të tyre personal, duke cenuar të drejtën për privatësi dhe kontroll mbi të dhënat personale. Një tjetër problematikë lidhet me sigurinë kibernetike. Sulmet kibernetike dhe rrjedhjet e të dhënave mund të ekspozojnë informacion të ndjeshëm të turistëve dhe të dëmtojnë reputacionin e kompanive turistike.

Figura 2. Sfidat Etike të Inteligjencës Artificiale në Turizëm

Burimi: Përshtatur nga European Commission (2021).

2.3 Paragjykimi algoritmik dhe mungesa e transparences: Algoritmet e Inteligjencës Artificiale mund të reflektojnë paragjykime të pranishme në të dhënat e përdorura për trajnim (Floridi & Cowls, 2019). Kjo mund të çojë në diskriminim në proceset e rekomandimit të shërbimeve turistike, në modelet dinamike të çmimeve ose në aksesin ndaj ofertave turistike. Për shembull, sistemet automatike të çmimeve mund të ofrojnë çmime të ndryshme për përdorues të ndryshëm bazuar në vendndodhje, histori kërkimesh ose sjellje online. Kjo krijon shqetësime serioze mbi drejtësinë sociale dhe barazinë në aksesin ndaj shërbimeve turistike.

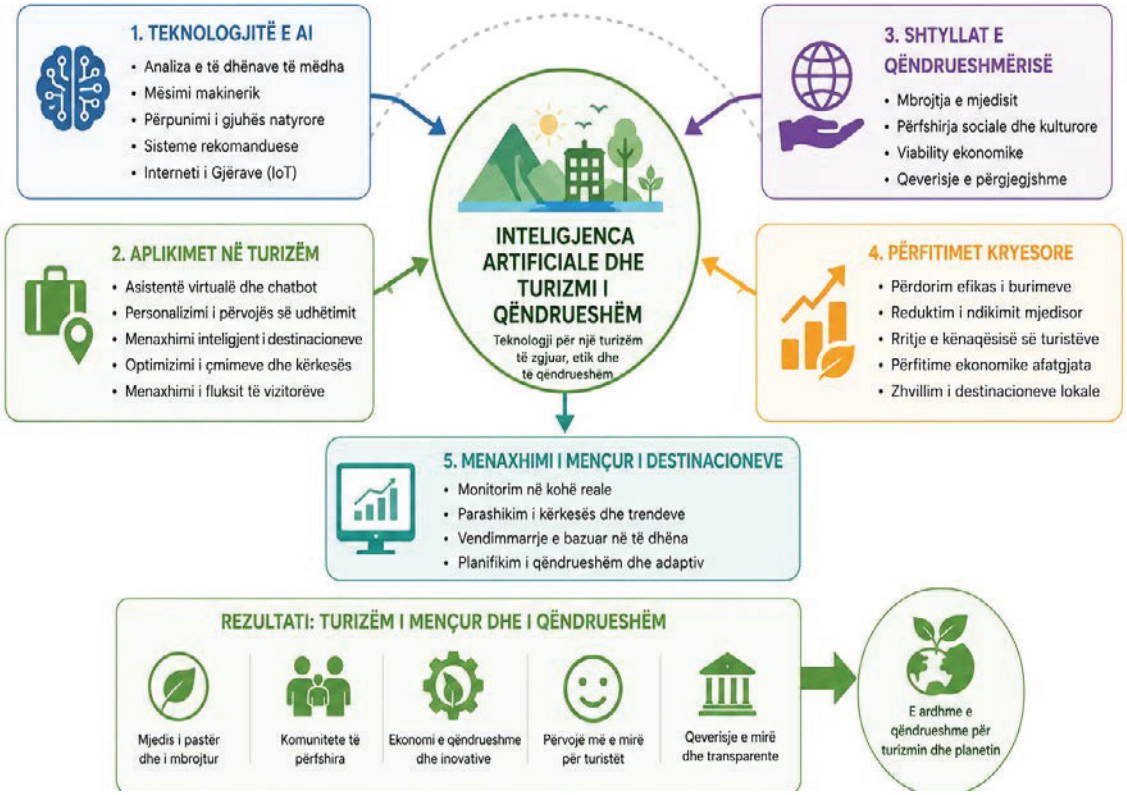
Një tjetër sfidë lidhet me mungesën e transparencës në proceset algoritmike. Shumë sisteme inteligjente funksionojnë si "black box", ku përdoruesit nuk kuptojnë mënyrën se si merren vendimet automatike. Kjo ul besimin e konsumatorëve dhe krijon pasiguri mbi përgjegjshmërinë e sistemeve inteligjente.

2.4 Inteligjenca Artificiale dhe qëndrueshmëria: Inteligjenca Artificiale luan një rol të rëndësishëm në promovimin e turizmit të qëndrueshëm (UNWTO, 2022). Teknologjitë inteligjente mund të përdoren për menaxhimin e flukseve turistike, optimizimin e konsumit të energjisë dhe reduktimin e ndikimeve negative mjedisore.

Përmes analizës së të dhënave në kohë reale, destinacionet turistike mund të monitorojnë kapacitetet mbajtëse dhe të shmangin mbingarkesën turistike. Gjithashtu, sistemet inteligjente mund të ndihmojnë në optimizimin e transportit dhe menaxhimin e mbetjeve.

Megjithatë, zhvillimi i IA kërkon përdorimin e infrastrukturave të avancuara digjitale dhe qendrave të mëdha të të dhënave, të cilat konsumojnë sasi të konsiderueshme energjie (UNEP, 2020). Kjo krijon një paradoks midis inovacionit teknologjik dhe mbrojtjes së mjedisit.

Figura 3. Inteligjenca Artificiale dhe Turizmi i Qëndrueshëm



Burimi: *Përshtatur nga UNEP (2020) dhe UNWTO (2022).*

3. Metodologjia

Ky studim u mbështet në një qasje cilësore dhe interpretuese, e cila synoi të analizonte në mënyrë kritike literaturën bashkëkohore mbi Inteligjencën Artificiale, etikën digjitale dhe zhvillimin e qëndrueshëm në turizëm (OECD, 2021).

Të dhënat u mblodhën përmes rishikimit sistematik të literaturës shkencore, artikujve akademikë dhe raporteve institucionale ndërkombëtare.

Analiza u fokusua në tre dimensione kryesore:

- **Privatësia dhe siguria e të dhënave;**
- **Transparenca dhe paragjykimi algoritmik;**
- **Ndikimi i IA në qëndrueshmërinë ekonomike, sociale dhe mjedisore.**

Përzgjedhja e literaturës u bazua në relevancën shkencore, aktualitetin e burimeve dhe lidhjen e tyre me objektivat e studimit.

Tabela 1. Përfitimet dhe Sfidat Etike të IA në Turizëm

Teknologjia IA	Përfitimet Kryesore	Sfidat Etike
Chatbot dhe asistentë virtualë	Shërbim i shpejtë dhe 24/7	Privatësia e të dhënave
Sistemet e rekomandimit	Personalizim i eksperiencës	Mbledhja masive e të dhënave
Dynamic Pricing	Optimizim i fitimeve	Diskriminim algoritmik
Smart Systems	Efikasitet energjetik	Konsum i lartë energjie

Burimi: Përpunim i autorëve

4. Analiza dhe diskutimet

4.1 Përfitimet e IA në industrinë e turizmit: Integrimi i Inteligjencës Artificiale në industrinë turistike ka krijuar mundësi të rëndësishme për përmirësimin e efikasitetit operacional dhe personalizimin e eksperiencës së turistit (Ivanov & Webster, 2019). Automatizimi i proceseve ka reduktuar kostot operative dhe ka përmirësuar shpejtësinë e ofrimit të shërbimeve.

Sistemet inteligjente të rekomandimit analizojnë preferencat individuale të turistëve dhe krijojnë eksperienca të personalizuara (Tussyadiah, 2020). Kjo rrit kënaqësinë e klientëve dhe përmirëson besnikërinë ndaj markave turistike.

4.2 Sfidat e privatësisë dhe mbrojtjes së të dhënave: Një nga çështjet më të ndjeshme etike lidhet me mbledhjen dhe ruajtjen masive të të dhënave personale të turistëve (European Commission, 2021). Platformat turistike monitorojnë sjelljen online të përdoruesve, preferencat individuale dhe aktivitetet gjatë udhëtimit.

Mungesa e transparencës mbi përdorimin e këtyre të dhënave cenon të drejtën për privatësi dhe ul besimin e konsumatorëve. Për më tepër, rritja e sulmeve kibernetike paraqet rrezik serioz për sigurinë e informacionit personal.

4.3 Diskriminimi dhe paragjykimi algoritmik: Algoritmet inteligjente mund të krijojnë diskriminim të pavetëdijshëm bazuar në të dhënat historike të përdorura për trajnim (Floridi & Cowls, 2019). Për shembull, sistemet dinamike të çmimeve mund të favorizojnë kategori të caktuara përdoruesish dhe të krijojnë pabarazi në aksesin ndaj shërbimeve turistike.

Për të shmangur këto problematika, kompanitë turistike duhet të zhvillojnë algoritme transparente dhe të audituehsme, të cilat respektojnë parimet e drejtësisë sociale dhe mosdiskriminimit.

4.4 IA dhe qëndrueshmëria në turizëm: Inteligjenca Artificiale mund të kontribuojë ndjeshëm në zhvillimin e turizmit të qëndrueshëm përmes optimizimit të përdorimit të burimeve dhe reduktimit të ndikimeve negative mjedisore (UNWTO, 2022).

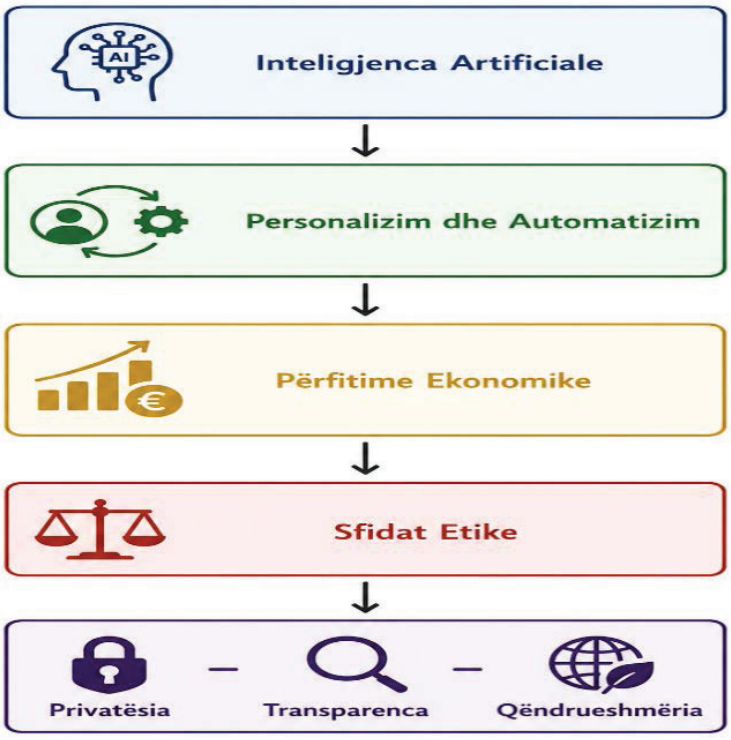
Sistemet inteligjente mund të monitorojnë konsumin e energjisë në hotele, të menaxhojnë flukset turistike dhe të optimizojnë transportin në destinacionet turistike. Megjithatë, infrastruktura teknologjike e IA kërkon konsum të lartë energjie dhe përdorim intensiv të qendrave të të dhënave (UNEP, 2020).

5. Rekomandimet

Për të garantuar përdorimin etik dhe të qëndrueshëm të Inteligjencës Artificiale në turizëm, rekomandohen këto masa:

1. Hartimi i politikave të qarta për mbrojtjen e të dhënave personale dhe respektimin e privatësisë së përdoruesve.
2. Kritja e transparencës në përdorimin e algoritmeve dhe informimi i konsumatorëve mbi proceset automatike të vendimmarrjes.
3. Zhvillimi i algoritmeve të drejta dhe pa paragjykime diskriminuese.
4. Investimi në sisteme të avancuara të sigurisë kibernetike.
5. Promovimi i përdorimit të IA për menaxhimin e qëndrueshëm të destinacioneve turistike.
6. Bashkëpunimi ndërmjet institucioneve akademike, industrisë turistike dhe politikëbërësve për krijimin e standardeve etike.
7. Edukimi dhe ndërgjegjësimi i profesionistëve dhe përdoruesve mbi etikën e Inteligjencës Artificiale.

Figura 4. Modeli Konceptual i Marrëdhënies midis IA, Etikës dhe Qëndrueshmërisë



Burimi: *Hartuar nga autorët.*

6. Përfundime

Inteligjenca Artificiale po transformon në mënyrë të thellë industrinë e turizmit, duke krijuar mundësi të reja për personalizim, efikasitet dhe inovacion. Megjithatë, përdorimi i saj shoqërohet me sfida të rëndësishme etike që lidhen me privatësinë e të dhënave, paragjykimin algoritmik, mungesën e transparencës dhe ndikimet mjedisore.

Studimi evidentoi se zhvillimi etik dhe i qëndrueshëm i Inteligjencës Artificiale kërkon balancimin e inovacionit teknologjik me mbrojtjen e të drejtave themelore të individit, garantimin e transparencës dhe respektimin e parimeve të drejtësisë sociale.

Për të garantuar besimin e konsumatorëve dhe zhvillimin afatgjatë të turizmit inteligjent, është e domosdoshme krijimi i kornizave të forta rregullatore dhe etike. Në të ardhmen, përdorimi i IA duhet të orientohet drejt modeleve të përgjegjshme, transparente dhe të qëndrueshme, të cilat respektojnë privatësinë, barazinë dhe mbrojtjen e mjedisit.

Abstrakt

Teknologjitë të informacionit janë bërë sot dhe gradualisht pjesë e rëndësishme e aktiviteteve njerëzore si gjatë studimeve, punës, ashtu edhe gjatë kohës së lirë të tyre. Ndërkohë që në sektorin e turizmit po shohim një rritje të shpejtë të përdorimit të kësaj teknologjie me inteligjencë artificiale si dhe me përdorimin e realitetit virtual dhe të aplikacioneve mobile.

Me përparimin e madh të shkencave dhe teknologjive, Inteligjenca Artificiale (AI) është krijuar dhe ka evoluar sipas kërkesave jo vetëm të individëve, por edhe të bizneseve. Qëllimi i AI në afate kohore të gjatë, është që të arrijë nivelin e inteligjencës njerëzore në mënyrë që të zvogëlojë sasinë e punës manuale dhe mendore për njerëzit (McCarthy 2005, 39).

Rëndësia e këtij punimi qëndron në faktin e të kuptuarit, se si risitë teknologjike po ndryshojnë mënyrat e funksionimit të industrisë së turizmit, e konkretisht atë të shërbimeve të udhëtimit, të mikpritjes si dhe të përvojës së vizitorit.

Kërkimi shkencor ka si qëllim, të identifikojë avantazhet dhe sfidat e përdorimit të kësaj teknologjie në shërbimet e turizmit, të lidhura këto me përdorimin e inteligjencës artificiale (AI), me realitetin virtual (VR), si dhe me aplikacionet mobile (MA) në këtë industri, për të mundësuar përmirësimin e cilësise së tyre.

Avantazhet e punimit do të shihen në personalizimin e përvojës së udhëtarit, përmirësimin e efikasitetit operacional, reduktimin e kostove dhe në rritjen e transparencës në tregun e udhëtimeve.

Ndërsa, sfidat do të lidhen me sigurinë e të dhënave personale, barrierat kulturore dhe ligjore në përdorimin e teknologjive të informacionit si dhe në ndikimin e mundshëm të tyre në punësim dhe në ekonominë vendase të destinacioneve turistike. Ky studim gjithashtu thekson rëndësinë e adoptimit të teknologjive të informacionit në industrinë turistike në një kontekst global, duke u përshtatur me tendencat dhe standardet ndërkombëtare të shërbimeve turistike.

***Fjalët kyçe**: Industri turistike, Inteligjencë Artificiale (AI), Realitet virtual (VR), Aplikacione Mobile (MA), shërbime visitor-turistë.*

I. HYRJE

Turizmi dhe industria përkatëse, ka qenë e orientuar drejt shërbimeve njerëzore, por me kalimin e kohës, rritja e kërkesës për shërbime të personalizuara dhe të shpejta, ka bërë që bizneset të kuptojnë nevojën e përfshirjes së AI në operacionet e tyre, me qëllim përmirësimin e vazhduar të cilësisë së shërbimeve për vizitorët.

Teknologji të tilla të AI, si chatbot, sistemet e rekomandimeve, përpunimi natyral i gjuhës dhe të tjera si këto, kanë bërë të mundur që bizneset turistike të ofrojnë shërbime të personalizuara për vizitorët e tyre, si p.sh. chatbot-et kanë ndihmuar vizitorët të bëjnë rezervime, të porosisin ushqime dhe të ofrojnë informacione të tjera rreth një biznesi të caktuar.

Ndërkohë që, sistemet e rekomandimeve dhe aplikacionet mobile mund të sugjerojnë për vizitorët produkte ose të japin rekomandime të personalizuara për aktivitete, restorante dhe atraksione, bazuar në preferencat dhe në eksperiencat e udhëtimit të individëve.

Ndërsa, përpunimi natyral i gjuhës, mund t'u mundësojë bizneseve të kuptojnë reagimet e vizitorëve dhe të përmirësojnë shërbimet e tyre në përputhje me rrethanat e krijuara.

Inteligjenca artificiale është përdorur për të përmirësuar efikasitetin operacional në këtë industri, si p.sh. në parashikimet e ndryshme të cilat mund të ndihmojnë bizneset të ndikojnë tek kërkesa dhe të rregullojnë veprimtarinë e tyre, duke optimizuar burimet, reduktuar mbetjet dhe rritur fitimin. Për më tepër, sistemet me teknologji të AI, mund të automatizojnë detyrat rutinë, të tilla si proceset e check-in dhe check-out dhe t'u mundësojnë bizneseve të përqëndrohen në detyra më komplekse të cilat kërkojnë vëmendjen e burimeve njerzore.

Studimi synon të ofrojë një analizë me qëllim që të kuptohet se si teknologjia e informacionit po e ndryshon funksionimin e industrisë së turizmit në kuadrin e ofrimit të udhëzimeve të vlefshme në përdorimin e saj më efektiv dhe më inovativ në këtë sektor të rëndësishëm të ekonomisë, duke identifikuar përfitimet që ofrohen për turistët, si dhe sfidat me të cilat përballen operatorët turistikë në adaptimin e saj.

Punimi synon të:

- *Analizohet* ndikimi i inteligjencë artificiale në personalizimin e përvojave turistike dhe në optimizimin e shërbimeve në destinacione të ndryshme turistike.
- *Shqyrtohet* roli i aplikacioneve mobile në lehtësimin e komunikimit, rezervimit dhe udhëzimeve për turistët gjatë përvojës së tyre të udhëtimit.
- *Vlerësohet*përdorimi i realitetit virtual për të krijuar përvojat e paharrueshme për turistët, të cilat ndihmojnë në promovimin e destinacioneve dhe planifikimin e udhëtimeve.

  Gjatë punimit, në mënyrë shumë të natyrshme, lindi *pyetja:*

- Si ndikon përdorimi i inteligjencës artificial me aplikacionet mobile dhe me realitetin virtual në përmirësimin e përvojës së turistëve dhe zhvillimin e industrisë së turizmit?

Punimi bazohet në analizën e teknologjive të përmendura (AI, VR, dhe MA), si dhe në identifikimin e tyre specifik në industrinë e turizmit, duke përdorur një gamë të gjerë burimesh dhe metodologji hulumtimi për të mbështetur analizën e bërë.

II. METODOLOGJIA

Ky punim fokusohet në një analizë të literatures ekzistuese mbi përdorimin e inteligjencës artificiale, aplikacioneve mobile dhe realitetit virtual në industrinë e turizmit, duke shqyrtuar dhe analizuar artikujt të ndryshëm shkencorë dhe kohor, raporte hulumtuese si dhe materiale të ndryshme të botuara që lidhen me të, sipas referencave përkatëse.

Punimi mbështetet në analizën e artikujve të studiuesve të ndryshëm të cilët kanë trajtuar aplikimin e këtyre teknologjive në sektorin e turizmit; në raporte të organizatave ndërkombëtare të turizmit për teknologjitë e informacionit të bëra për këtë industri; si dhe në analizën e studimeve të rasteve,të cilat kanë pasqyruar aplikime praktike të inteligjencës artificiale, të aplikacioneve mobile dhe të realiteteve virtuale në destinacione turistike, të realizuara këto nga ofruesit e shërbimeve përkatëse.

III. ANALIZA E PËRDORIMIT TË TEKONLOGJIVE TË INFORMACIONIT NË INDUSTRINË E TURIZMIT

Inteligjenca Artificiale në industrinë e hoteleve

Vitet të fundit, në industrinë hoteliere, teknologjitë e reja të informacionit kanë pësuar një rritje të konsiderueshme, nërmjet proceseve inteligjente të tilla, si në check-in, Front Desk-inteligjente, asistentë dixhitalë, chatbot ose robotë shërbimi, etj., të cilat janë bërë të gjithëpranishëme dhe që po shoqërohen edhe me një ndryshim të madh në mënyrën se si ofrohen ato (Li et al., 2021; Foris et al., 2020).

Në të ardhmen e afërt, nëpërmjet AI, vizitorët, për të shkuar në dhomë, mund të mos ndjekin nga pas një punonjës hoteli, por një robot shërbimi (Li et al., 2021). Madje, pytjet rreth qëndrimit të tyre në hotel, mund të mos marrin përgjigje nga personeli i shërbimit, por nga chatbot-et; po kështu edhe pritja tradicionale, mund të mos jetë më me personel shërbimi, por mund të jetë e ndërtuar mbi bazën Front Desk-e inteligjente, duke përdorur lehtësira për vetë-check-in në hotele.

Kjo tregon se industria e mikpritjes është disa hapa para, ose po kalon një ndryshim të madh teknologjik, për të cilën ka shumë aplikime të mundshme të inteligjencës artificiale, që nga rezervimi i hotelit e deri tek marrja e check-out-eve të vizitorëve, të cilat do të jenë të prekura nga përdorimi i inteligjencës artificiale gjithnjë e më shumë (Nguyen et al., 2020).

Ndikimi i AI në operacionet e industrisë hoteliere

Sot inteligjenca artificiale (AI) duket si një mjet i fuqishëm që po përmirëson efikasitetin dhe efektivitetin e operacioneve të ndryshme të turizmit, të cilat lidhen si me rritjen e përvojës pozitive të vizitorit, ashtu edhe me të ardhurat e bizneseve.

Shumë studime janë bërë në këtë drejtim dhe ndër të tjera janë qartësuar çështje të tilla, se:

- Si ndikojnë teknologjitë e AI, të tilla si chatbot, sistemet e rekomandimeve dhe përpunimi natyral i gjuhës, në përvojën e vizitorit në industrinë e turizmit?

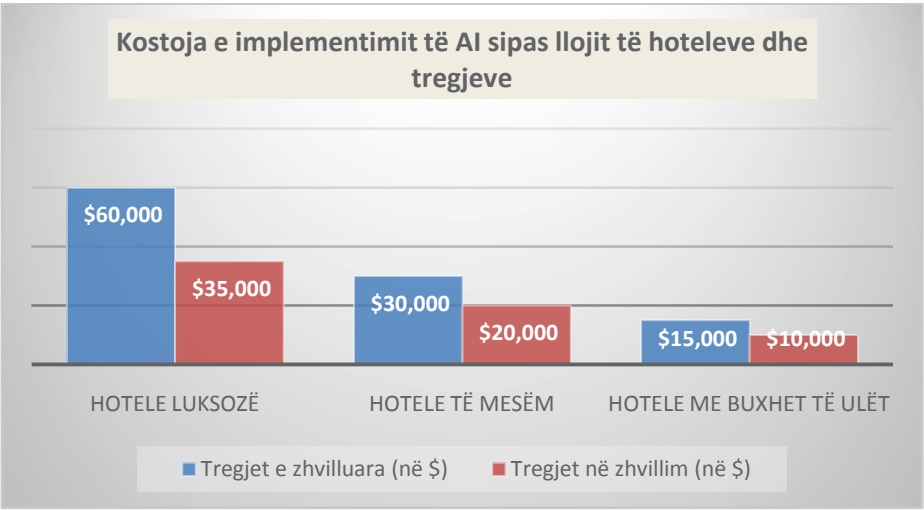
- Si sistemet me teknologji të AI, të tilla si analiza parashikuese, optimizojnë efikasitetin operacional dhe menaxhimin e të ardhurave në industrinë e turizmit?

- Cilat janë sfidat me të cilat përballen bizneset në industrinë e turizmit në adaptimin dhe zbatimin e teknologjive të AI dhe si mund t'i kapërcejnë këto sfida?

- Cili është perceptimi i vizitorëve ndaj përdorimit të teknologjive të AI në industrinë e turizmit dhe si ndikon ai në besnikërinë dhe kënaqësinë e tyre?

Gjatë analizës së këtyre problematikave, në këtë punim doli se ndikimi i AI në operacionet e hoteleve ka:

- *Përfitime dhe sfida* të shumta, duke përfshirë rritjen e efikasitetit, uljen e kostos dhe përmirësimin e cilësisësë shërbimit. Automatizimi i detyrave rutinë nga chatbot-et, si pastrimi dhe menaxhimi i mirëmbajtjes ka ulur kostot e punës dhe ka përmirësuar efikasitetin operacional. Megjithatë, sfida të tilla si kostot e larta të zbatimit, mungesa e ekspertizës teknike dhe shqetësimet e sigurisë për të dhënat personale, pengojnë deri diku përfshirjen e gjerë të AI.
- *Ka dallime midis llojeve të hoteleve dhe tregjeve*, ku hotelet luksoze kanë më shumë burime për të investuar në AI, ndërsa hotelet me buxhet të ulët kanë vështirësi me kostot e zbatimit, sikurse hotelet në tregjet e zhvilluara kanë akses më të madh në teknologjinë dhe ekspertizën e AI se sa ato në tregjet në zhvillim.



Grafiku Nr.1 *Kosto e implementimit të AI sipas llojit të hotelit dhe tregjeve. Burimi: Nga studimi*

-Ka ndikim në efikasitetin operacional, uljen e kostos dhe në cilësinë e shërbimit.

Chatbot-et me teknologji AI dhe asistentët virtual kanë përmirësuar ndërveprimet me vizitorët dhe kanë reduktuar kohën e pritjes. Mirëmbajtja e parashikuar dhe sistemet e menaxhimit të inventarit kanë reduktuar kohën e ndërprerjes së pajisjeve dhe mbetjet e inventarit, duke çuar në uljen e kostos. Sistemet e pastrimit me teknologji të AI kanë përmirësuar cilësinë e pastrimit dhe kanë reduktuar kohën e ri-kthimit të kapitalit.

Gjatë analizës në këtë punim doli se ndikimi i AI në përvojën e vizitorëve ka:

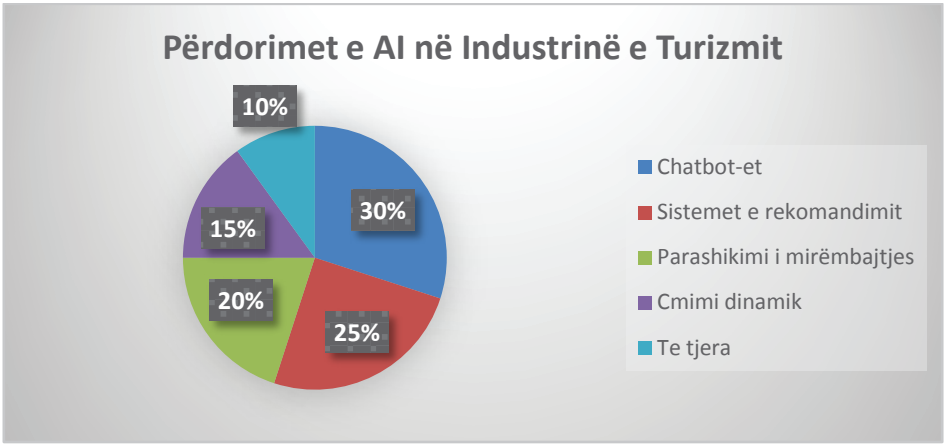
- *Përfitime dhe sfida në përdorimin e* AI në menaxhimin e përvojës së vizitorëve, duke ofruar përvoja dhe rekomandime të personalizuara, të cilat rrisin kënaqësinë e vizitoreve, besnikërinë dhe përtëritjen e biznesit. Sidoqoftë, shqetësimet për mungesën e sigurusë për të dhënat personale të vizitorëve dhe mundësia për ndërveprime jo-personale mund të pengojnë deri diku përdorimin e AI në shërbimin ndaj vizitorëve.
- *Dallime midis llojeve të hoteleve dhe tregjeve* kundikimi i AI në përvojën e vizitorëve ndryshon në hotele dhe tregje të ndryshme. Hotelet luksoze mund të përdorin inteligjencën artificiale për të ofruar përvoja më të personalizuara, ndërsa hotelet me buxhet të ulët mund të luftojnë për të balancuar uljen e kostos dhe rritjen e kënaqësisë së vizitorëve. Hotelet në tregjet e zhvilluara kanë akses më të madh në teknologjinë dhe ekspertizën e AI se sa ato në tregjet në zhvillim.
- *Ndikim në kënaqësinë e vizitorëve, besnikërinë dhe përtëritjen e biznesit*. Sistemet e rekomandimeve me teknologji të AI si dhe preferencat e personalizuara të vizitorëve kanë përmirësuar kënaqësinë dhe besnikërinë e vizitorëve. Chatbot-et dhe asistentët virtualë kanë ofruar informacion të saktë dhe në kohë duke reduktuar zhgënjimin e vizitorëve dhe duke përmirësuar përvojën e përgjithshme të tyre.

Gjatë analizës në këtë punim doli se ndikimi i AI në menaxhimin e të ardhurave ka:

- *Përfitime dhe sfida,* ku sistemet e menaxhimit të të ardhurave me teknologji të AI, i mundësojnë hoteleve të optimizojnë çmimet, parashikimin dhe shpërndarjen e gjëndjes së inventarit, duke çuar në rritjen e të ardhurave, normave të shfrytëzimit dhe fitimit.
- *Dallime midis llojeve të hoteleve dhe tregjeve,* kupërfitimet dhe sfidat e zbatimit të AI në menaxhimin e të ardhurave, ndryshojnë në lloje të ndryshme hotelesh dhe tregjesh, ku hotelet luksoze kanë më shumë burime për të investuar në AI, ndërsa hotelet buxhetore

mund të kenë vështirësi në kostot e zbatimit. Hotelet në tregjet e zhvilluara kanë akses më të madh në teknologjinë dhe ekspertizën e AI se sa ato në tregjet në zhvillim.

-*Ndikim në të ardhurat e hoteleve,* në *normat e okupimit dhe të rentabilitetit,* kupërdorimi isistemeve të menaxhimit të të ardhurave me teknologji të AI kanë rezultuar me rritje të të ardhurave, të normave të okupimit dhe të fitimit në hotele. Parashikimi dinamik i çmimeve dhe i kërkesave, ka bërë që hotelet të rregullojnë çmimet dhe të përdorin gjendjen e inventarit në kohë reale, duke çuar në rritjen e të ardhurave të tyre si dhe në shpërndarjen e inventarit me teknologji të AI, duke reduktuar mbetjet, rritur normat e shfrytëzimit dhe të fitimit.



Grafiku Nr.2. Përdotimet e AI në Industrinë e Turizmit, Burimi: Nga studimi

Aplikimi i AI në industrinë hoteliere në këndvështrimin e punonjësve

Robotët, Inteligjenca Artificiale dhe Automatizimi i Shërbimit, ose RAISA, janë bërë gjithnjë e më të aksesueshme dhe të përballueshme për një gamë më të gjerë biznesesh, duke përfshirë edhe operacionet mikpritëse të zbatuara gjatë dy dekadave të fundit, të shoqëruara këto edhe me një ndjenjë shqetësimi, që ky zhvillim teknologjik do të zëvendësojë fuqinë punëtore, për shkak të faktorëve të tillë, si kostoja e punës dhe shmangia e gabimeve njerëzore.

Integrimi i teknologjisë së "zgjuar" dhe internetit në industrinë hoteliere përmirëson shumë efikasitetin e punonjësve duke i mundësuar atyre evitimin e punëve të vogla dhe duke i dhënë më shumë kohë dhe burime për të kryer detyra më të rëndësishme. Prandaj, në vend të ndjenjës së shqetësimit për automatizimin, është e rëndësishme të kuptohet se si do të përdoret kjo teknologji për t'i shërbyer më mirë punonjësve të shërbimit.

Rëndësia e teknologjisë mobile në industrinë e turizmit

Smartfonët janë fenomeni më i ri në sektorin e turizmit dhe një realitet i shekullit të 21-të (Malmir et al., 2017), pasi sistemet celulare janë bërë mjete jetike që i mundësojnë turistëve lundrimin në një botë të pasigurt. Ato janë një pjesë integrale e industrisë, duke sjellë disa avantazhe që po prekin shumë biznese në tërësi, por edhe turizmin në veçanti.

Telefonat "smart" kanë transformuar sjelljet e konsumatorëve, sepse ata janë të lidhur në çdo kohë dhe kudo nëpërmjet mijëra aplikacioneve të ndryshme, duke zgjeruar funksionalitetin e tyre. Ata u përdorën shpejt si një mjet udhëtimi në kërkimin e informacionit turistik dhe në planifikimin e udhëtimit, duke i mundësuar turistëve aksesin e menjëherëshëm të informacionit në aspekte të ndryshme që po ndikon në udhëtimin e tyre, si: moti, akomodimet, atraksionet dhe transporti. Nëpërmjet aplikacioneve mobile, ata kanë akses në një shumëllojshmëri informacioni, duke zgjidhur problemet në mënyrë efektive, duke ndarë përvojat dhe ruajtur

kujtimet e tyre. Qasja në këto burime informacioni dhe kërkimi ka çuar në ndryshime të perceptimeve dhe sjelljeve të vizitorëve, ku theksohet rritja e fleksibilitetit, planifikimi më i detajuar dhe në një kohë më të shkurtër, si dhe rritja e numrit të udhëtimeve. Vlera e kohës dhe parasë është e rëndësishme për konsumatorët dhe kur ata janë nën presionin e tyre, vendimet meren në mënyrë emocionale.

Në këtë kuptim, konkludojmë se nevojat e udhëtarëve në lidhje me përdorimin e telefonave "smart", dhe rrjedhimisht të MTA-ve, (Aplikacioneve Mobile të Turizmit) janë të lidhura ngushtë me dobinë e perceptuar; që është komoditeti, efektiviteti dhe produktiviteti. Telefonat "smart" janë shoqërues udhëtimi dhe që jo vetëm shoqërojnë por edhe ndihmojnë turistët, duke i bërë përvojat e tyre më të këndshme.

Ndikimi i Aplikacineve Mobile në përvojën e turistëve

Motivet kryesore për përdorimin e aplikacioneve të udhëtimit janë performanca, kënaqësia dhe vlera e perceptuar e udhëtimit.

Një artikull hulumtues i botuar në Maj të vitit 2021, përdori një metodologji kërkimi sasior për të kuptuar perceptimet dhe qëndrimet e turistëve ndaj MTA-ve. Mënyra e mbledhjes së dhënave të studimit ishte nëpërmjet një pyetësori të shpërndarë online. Studimi ishte përqendruar tek turistë, të cilët përdorin ose kanë përdorur aplikacione mobile gjatë udhëtimit ose të paktën në një nga fazat e udhëtimit. Analiza e të dhënave konsistoi në një zgjedhje prej 110 personash nga mosha 22-73 vjeç. Duke marrë parasysh qëllimin për të vlerësuar perceptimin dhe qëndrimet e turistëve në lidhje me përdorimin e MTA-ve, pyetësori u strukturua në katër seksione: (1) njohuritë dhe përdorimi, (2) motivimet për përdorim, (3) momentet e përdorimit, dhe (4) shkalla e kënaqësisë, ndikimi në përvojë dhe vlera e perceptuar.

Rezulatet që u morën nga ky pyetësor ishin si më poshtë:

Motivet kryesore për përdorimin e aplikacioneve të udhëtimit janë performanca e tyre (28%), kënaqësia (23%) dhe vlera e perceptuar (21%). Këto gjetje janë gjithashtu në përputhje edhe me studime të tjera të mëparshme, të cilat kanë treguar se nevojat e udhëtarëve në lidhje me përdorimin e telefonave "smart" janë të lidhura ngushtë me dobinë e perceptuar; domethënë me komoditetin, efektivitetin dhe produktivitetin e udhëtimit të tyre.

Përfitimet kryesore të MTA-ve janë kudo: akses nga çdo vend (23%), disponueshmëri e menjëhershme (21%), qasje në informacion (20%) dhe komoditeti (15%). Një përfitim tjetër është edhe organizimi dhe kapaciteti i planifikimit (12%), i cili vërteton motivet e identifikuara.

Nga kjo arrijmë në përfundimin se udhëtarët kërkojnë zgjidhje me përgjigje të menjëhershme dhe funksionale, si dhe lehtësimin e fazës së planifikimit që mund të bëhet gjatë udhëtimit, si gjetja e një restoranti ose blerja e biletave të hyrjes në një monument ose atraksion, etj.

Sipas studimit shumica e të anketuarve e pranuan ndikimin e përdorimit të MTA-ve në përvojën e udhëtimit. Nga të anketuarit 60.3% pranuan se ka patur ndikim në përvojën e tyre të udhëtimit dhe vetëm 23.4% besonin se nuk kishte asnjë ndikim.

Ndikimi në përvojën e udhëtimit vjen nga fakti se MTA-të mundësojnë planifikim më të mirë gjatë udhëtimit dhe komoditet më të madh. Këto konfirmojnë se MTA-të nxisin lidhje më të mëdha dhe akses në informacion si dhe rrisin ndjenjën e sigurisë, duke siguruar më shumë argëtim, më shumë siguri dhe më pak stres. Nga ana tjetër, ato i ofrojnë turistëve mundësinë për të përmirësuar përvojën në një destinacion, duke i ofruar informacionin përkatës dhe të personalizuar në çdo kohë dhe kudo.

Punimi tregon qartë se telefonat celularë po ndryshojnë funksionimin e turizmit, duke plotësuar nevojat e turistëve, të cilët kërkojnë akses me shpejtësi të lartë në informacionin përkatës dhe

me përmbajtje multimediale. Udhëtarët e rinj janë agjentët e udhëtimit të vetes së tyre, duke kërkuar përvoja të individualizuara, duke fituar akses në shërbime dhe informacione përmes telefonave "smart", kudo dhe në çdo kohë. Aplikacionet mobile kanë ndryshuar mënyrën se si turistët jetojnë dhe përjetojnë një destinacion. Për turizmin, biznesi i MTA-ve është një sfidë e vërtetë, sepse duhet të ecet me ritmin e nevojave dhe dëshirave të vizitorëve.

Realiteti i Zgjeruar (AR) dhe Virtual (VR) në Turizëm

Zbavitjet dhe argëtimet nëpërmjet teknologjive të reja sot, jo vetëm po zgjerojnë horizontet për industrinë turistike por, po krijojnë edhe një përvojë të dëshiruar për udhëtarët në turizëm. Këto teknologji gjithëpërfshirëse po ndikojnë shumë në vendimet për udhëtimet, si dhe po ndihmojnë udhëtarët të kapërcejnë sfidat që lindin gjatë udhëtimit.

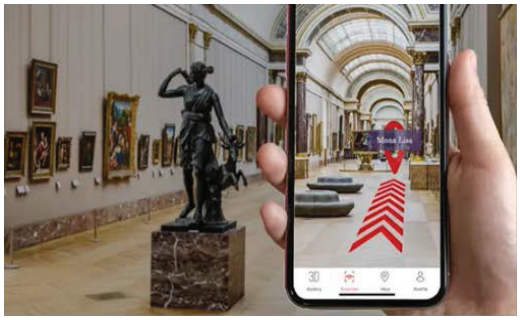
Sipas një raporti nga Expedia, pothuajse 78% e vendimeve të udhëtarëve ndikohen nga përmbajtja interaktive e realizuar nga markat e udhëtimit. Me ardhjen e Realitetit Dixhital, bizneseve u janë hapur rrugë dhe mundësi të shumta për të përmirësuar shërbimet e tyre dhe për të personalizuar përvojat e ofruara për vizitorët.

Realiteti i zgjeruar (AR) po transformon përvojën turistike përmes zgjidhjeve të tij interaktive të navigimit, udhëtimeve të personalizuara dhe tërheqëse, nëpërmjet faqeve për të kapërcyer pengesat e gjuhëve të huaja dhe sigurimit të informacionit në kohë reale, për ta bërë udhëtimin sa më të përshtatshëm. Me ndihmën e telefonave "smart", aplikacionet e udhëtimit me teknologji të AR po ndihmojnë turistët të zbulojnë rrugët, vendet e interesit, etj. Për më tepër, AR kanë revolucionarizuar menutë e restoranteve, duke i sjellë ato përmes pamjeve paraprake 3D të pjatave dhe të servirjeve. Fytyra e marketingut të turizmit po ndryshon plotësisht, pasi broshurat dhe katalogët tradicionalë po zëvendësohen me katalogët vizualë të animuar të cilët lejojnë vendim-marrje më të shpejta për turistët si dhe mundësi eksplorimi dhe përjetimi virtual të një destinacioni që ata duan të rezervojnë. Sot, pushimet me VR janë gjëja tjetër e rëndësishme që bie ndesh me idenë e udhëtimeve tradicionale dhe që përqafon udhëtimin virtual në vende jo-reale, si udhëtimi në hapësirë ose edhe në vende historike.

Vizitat në muze nëpëmjet AR, si eksperienca të reja në Turizëm

Teknologjia e re AR ka marrë vëmendje të madhe nga kompani dhe industri të shumta. Industria e turizmit ka përfituar menjëherë nga zbatimi i kësaj teknologjie për të rritur eksperiencat turistike të paprovuara më parë. Shëmbull mund të jetë përdorimi i AR, Mountains Map dhe Vieë Ranger, dy aplikacione në natyrë, që kanë përshtatur informacionet e detajuara për shtigjet gjatë ecjeve në mal, duke u mundësuar alpinistëve të realizojnë aventurat e tyre.

Adaptimi i teknologjisë së AR në sektorin e muzeve premton përfitime të mëdha, pasi ai transformon ekspozitat përmes imazheve dhe animacioneve vizuale 3D duke i ofruar vizitorëve një nivel të ri të pranisë virtuale (Tussyadiah et al., 2018). Për më tepër, teknologjia AR mund të përdoret si një mjet për të menaxhuar përvojat e turistëve në muze.



Studiuesit kanë zhvilluar shumë aplikacione të VR për të vizituar katedrale të rëndësishme si Bazilika e Shën Pjetrit në Vatikan, të cilat mund të përdoren nga turistët që vizitojnë vendet e shenjta pa shkuar fizikisht. Ka aplikacione që lejojnë ecjen në parqe kombëtare, shikimin e safareve të kafshëve, eksplorimin e objekteve hoteliere, etj. Për më tepër, sistemet argëtuese të simulatorëve të VR janë bërë një pajisje standarde në parqet tematike, si Dreamëorld apo edhe Cyber Speedëay në LasVegas (Pestek & Sarvan, 2020).

Fakti që VR mund të jetë një kërcënim për industrinë e turizmit dhe të zëvendësojë udhëtimet tradicionale është diskutuar për disa vite me rradhë (Schiopu et al., 2021). Edhe pse Kang (2020) argumenton se nuk është më e nevojshme të kalosh orë të tëra në aeroplan dhe të harxhosh një shumë të madhe parash për të vizituar një destinacion turistik. Ndërkohë, Guttentag (2010) beson se nuk ka asnjë provë që realiteti virtual së shpejti do të jetë në gjendje të zëvendësojë udhëtimin tradicional. Megjithatë, gjithnjë e më shumë studimet theksojnë se risitë dixhitale, si realiteti virtual mund të jenë një zgjidhje për turizmin pa pengesa (Schiopu et al., 2021). VR po bëhet një burim jetik për të reduktuar lëvizjen e njerëzve me udhëtim fizik. Për sa i përket ofrimit të një përvoje udhëtimi, VR mund të ofrojë përvoja mbi aftësitë standarde të një individi në komoditetin e shtëpive të tyre (Loureiro, Guerreiro, & Ali, 2020). Për shembull, Srifar (2018) diskuton se VR duket një alternativë e shkëlqyer për njerëzit e moshuar. Shumë njerëz nuk janë në gjendje të udhëtojnë dhe VR mund të jetë i dobishëm për grupe të veçanta që vuajnë nga ankthi ose ata me disa pa-aftësi fizike. Megjithatë, ka shqetësime në lidhje me ndikimet negative që VR mund të sjellë tek përdoruesit. Kjo teknologji nuk është ende e aksesueshme për të gjithë, veçanërisht ata me disavantazhe ekonomike. Ekziston edhe shqetësimi për efektet anësore të mundshme në shëndetin fizik të përdoruesve. Për shembull, Srifar (2018) argumenton se njerëzit e moshuar mund të përjetojnë disa shqetësime gjatë eksperimenteve të VR. Sipas studimit të tij, shumica e përdoruesve ankohen për shqetësime si: marramendje, nauzea dhe dhimbje koke.

Përdorimi i Teknologjisë së Informacionit në vendin tonë

Shqipëria është vend me një pasuri të jashtëzakonshme natyrore dhe kulturore, e cila po përjeton një transformim të rëndësishëm në sektorin e turizmit. Ndërsa teknologjitë e reja si inteligjenca artificiale (AI), aplikacionet mobile (MA) dhe realiteti virtual (VR) po zënë një rol gjithnjë e më të madh në zhvillimin global të turizmit, këto inovacione po fillojnë të përdoren edhe në vendin tonë, duke ofruar mundësi të reja për rritje dhe inovacion.

Inteligjenca artificiale po përdoret gjithnjë e më shumë në sektorin e turizmit për të përmirësuar shërbimet dhe përvojën e turistëve. Në Shqipëri, AI po integrohet në mënyrë graduale përmes chatbot-eve dhe sistemeve të rekomandimit që ndihmojnë turistët të marrin informacion në kohë reale dhe të gjejnë destinacionet e duhura, bazuar në preferencat e tyre. Një nga shembujt është përdorimi i platformave të rezervimeve dhe guidave që ofrojnë rekomandime të personalizuara për hotele, restorante dhe aktivitete kulturore, duke krijuar një përvojë të mirë për vizitorët.

Aplikacionet mobile kanë përmirësuar mënyrën se si turistët planifikojnë dhe përjetojnë udhëtimet e tyre në vendin tonë. Turistët tani mund të përdorin aplikacione për të bërë rezervime, për të naviguar në atraksione turistike dhe për të marrë udhëzime të personalizuara për çdo destinacion. Platforma si *Visit Tirana* dhe *Albania Holiday* ofrojnë informacion të përditësuar për vendet e vizitueshme, udhëzues kulturor dhe për aktivitetet që zhvillohen në zona të ndryshme turistike. Gjithashtu, aplikacionet për bileta online për muze dhe evente të ndryshme kanë lehtësuar aksesin dhe përvojën e vizitorëve vendas dhe të huaj.

Një tjetër teknologji që po fiton terren në Shqipëri është realiteti virtual (VR), i cili ofron një mënyrë unike për të promovuar destinacionet turistike shqiptare përmes përvojave virtuale, që i

lejojnë turistëve të eksplorojnë vende të ndryshme para se t'i vizitojnë fizikisht ato. Kjo teknologji po përdoret veçanërisht për promovimin e atraksioneve historike dhe kulturore, si për *Beratin, Gjirokastrën,* dhe*Butrintin,* të cilat mund të eksplorohen virtualisht nga vizitorët përmes turizmit virtual, gjë që ka ndihmuar në zgjerimin e tregut turistik dhe ka rritur ndërgjegjësimin për trashëgiminë kulturore të vendit.

Megjithatë, përfshirja e këtyre teknologjive të reja në vend përballet edhe me disa sfida. Infrastruktura teknologjike dhe aksesueshmëria mbeten pengesa për adaptimin më të gjerë të AI, MA dhe VR. Për më tepër, trajnimi i punonjësve dhe përgatitja e industrisë për të përqafuar këto inovacione është ende në një fazë jo shumë të zhvilluar. Pavarësisht këtyre sfidave, potenciali për rritje është i madh. Nëse Shqipëria vazhdon të investojë në teknologji dhe në përmirësimin e aftësive digjitale të sektorit turistik, ajo mund të bëhet një destinacion tërheqës për turistët që kërkojnë përvoja mbresëlënëse dhe të personalizuara.

IV. KONKLUZIONE DHE REKOMANDIME

Përdorimi i teknologjive të reja po transformon turizmin në Shqipëri, duke e bërë atë më të aksesueshëm, më të personalizuar dhe më inovativ, si dhe duke ofruar mundësi të shumta për të përmirësuar përvojën e turistëve dhe rritur ekonominë e vendit. Shqipëria, me burimet e saj mund të përqafojë këto zhvillime dhe të ecë drejt një turizmi të zgjuar dhe të qëndrueshëm.

Nga literatura e studiuar dhe nga shembujt konkretë, gjatë këtij punimi nxjerrim kokluzionet si vijon:

1. *Përmirësimi i Përvojës së Udhëtarëve:*

Inteligjenca artificiale (AI), aplikacionet mobile dhe realiteti virtual (VR) kanë sjellë një transformim të ndjeshëm, se si udhëtarët planifikojnë, eksplorojnë dhe ndajnë përvojat e tyre, duke lehtësuar aksesin në informacione dhe shërbime, e duke e bërë udhëtimin më të personalizuar më të këndshëm dhe më të besueshëm.

2. *Rritja e Efikasitetit Operacional:*

Përdorimi i AI në menaxhimin e operacioneve të hotelerisë ka çuar në automatizimin e detyrave rutinë dhe optimizimin e burimeve, duke rezultuar në uljen e kostove dhe në përmirësimin e cilësisë së shërbimeve.

3. *Sfida të Sigurisë dhe Etikës:*

Transformimi teknologjik sjell me vete sfida të rëndësishme, si çështje të sigurisë së të dhënave personale dhe të etikës në përdorimin e AI. Këto sfida kërkojnë një vëmendje të veçantë nga ana e operatorëve të turizmit për të siguruar përdorimin e tyre në përputhje me standardet etike dhe ligjore.

4. *Ndikimi në Ekonominë Lokale:*

Zbatimimi i këtyre teknologjive mund të ndikojë negativisht në punësim dhe në ekonominë lokale, duke sjellë një reduktim të nevojës për punonjës të caktuar. Prandaj, Industria pëkatëse duhet të zhvillojë strategji për të trajtuar ndikimet sociale dhe për të ofruar trajnime për punonjësit e saj.

5. *E Ardhmja e Turizmit Inteligjent:*

Në vendin tonë, turizmi inteligjent i mbështetur në këto teknologji është në rrugën e zhvillimit. Destinacionet që adaptojnë këto teknologji janë më të prirura të rrisin efikasitetin dhe të ofrojnë përvoja më të mira për turistët, duke u bërë më konkurruese në tregun global.

Rekomandime për të Ardhmen e Teknologjisë së Informacionit në fushën e turizmit në vendin tonë:

1. Të formulohen strategji të zhvillimit turizmit, bazuar në teknologjitë të reja të informacionit në mënyrë të përgjegjëshme dhe etike.
2. Të ngrihet baza ligjore e funksonimit etik të TI në vend, për të mundësuar sigurinë normale të përdorimit të të dhënave në sistem.
3. Të bëhen studimet përkatëse në këtë drejtim, me qëllim çdo investim i bërë, të jetë efiçent dhe t'i rezistojë kohës.
4. Të krijohen mundësitë për trajnime të ndryshme në fushën e TI në turizëm, përfishirë edhe trajnimet e vazhduara, me qëllim që performanca e funksionimit të tyre të jetë maksimale.

Menaxhimi i rrezikut kibernetik në banka: Ndërthurja e teknologjisë së avancuar me qëndrueshmërinë financiare

Msc.Elida Toli[1*], Dr. Pranvera Mziu[2]

[1,2]Departmenti Kolegji i Studimeve te Larta Profesionale, Kolegji Universitar I Biznesit

**Corresponding Author: e-mail: etoli@kub.edu.al*

Abstrakt

Nga analiza e realizuar në ambientet e Union Bank, në zyrën qendrore në Tiranë, evidentohet se siguria e të dhënave bankare duhet të trajtohet përmes një qasjeje të integruar, diskrete dhe dinamike. Kjo qasje përbën bazën teorike dhe praktike të këtij punimi dhe synon të orientojë edhe zhvillimin profesional në sektorin financiar.

Thelbi i studimit lidhet me nevojën për implementimin e teknologjive të avancuara dhe standardeve të larta të sigurisë për mbrojtjen e rrjeteve dhe bazave të dhënave. Institucionet bankare janë struktura komplekse dhe të ndjeshme ndaj kërcënimeve kibernetike, për shkak të natyrës kritike të informacionit dhe volumit të lartë të transaksioneve në kohë reale.

Një sfidë e rëndësishme është shpërndarja gjeografike e filialeve në të gjithë vendin, e cila e bën të domosdoshëm komunikimin në distancë. Ky komunikim rrit rrezikun e aksesit të paautorizuar dhe ekspozimin ndaj sulmeve, duke kërkuar masa të forta për mbrojtjen e transmetimit dhe përdorimit të dhënave, në përputhje me parimet e konfidencialitetit, integritetit dhe disponueshmërisë.

Në aspektin teknik, studimi mbështetet në standarde si Cisco CCNA dhe CCNP, sistemet Windows Server, programimi në C++ dhe menaxhimi i databazave te dhenave bankare me Oracle. Metodologjia përfshin analizën e sistemeve ekzistuese, identifikimin e dobësive dhe përmirësimin e tyre përmes zgjidhjeve bashkëkohore.

Në përfundim, siguria e informacionit në banka është një element strategjik që ndikon drejtpërdrejt në besimin e klientëve dhe stabilitetin financiar, duke e bërë investimin në këtë fushë një domosdoshmëri afatgjatë.

***Fjalet kyce**: Siguria kibernetike; Siguria e të dhënave bankare; Rrjetet kompjuterike; Bazat e të dhënave; Komunikimi në distancë; Menaxhimi i rrezikut; Infrastrukturë bankare.*

HYRJE

Pyetja kryesore kërkimore e këtij punimi lidhet me mënyrën se si duhet të trajtohet siguria e të dhënave në institucionet bankare: a duhet ajo të mbështetet vetëm në komponentët software, vetëm në infrastrukturën hardware, apo në një kombinim të integruar të të dyjave?

Analiza teorike dhe praktike e realizuar në këtë studim çon në përfundimin se siguria efektive e informacionit bankar nuk mund të garantohet në mënyrë të plotë vetëm nga njëra prej këtyre komponentëve. Përkundrazi, ajo duhet të trajtohet në mënyrë të harmonizuar dhe të integruar, ku teknologjitë software dhe infrastruktura hardware bashkëpunojnë për të krijuar një sistem të qëndrueshëm dhe të besueshëm sigurie.

Nga këndvështrimi teknologjik, komponentët software përfshijnë sistemet e enkriptimit, firewall-et, antiviruset, sistemet e autentifikimit dhe monitorimit të aksesit, ndërsa komponentët hardware lidhen me serverët, pajisjet e rrjetit, firewall-et fizike, storage systems dhe pajisjet e sigurisë së dedikuar. Integrimi i këtyre elementeve siguron mbrojtje më të lartë ndaj sulmeve kibernetike, aksesit të paautorizuar dhe humbjes së të dhënave.

Nga aspekti ekonomik, investimi në sigurinë e integruar përfaqëson një domosdoshmëri strategjike për institucionet bankare. Kostoja e implementimit të teknologjive të avancuara të sigurisë është dukshëm më e ulët krahasuar me humbjet financiare, ligjore dhe reputacionale që mund të shkaktohen nga një incident kibernetik apo rrjedhje e të dhënave. Një sistem sigurie i mirëstrukturuar ndikon drejtpërdrejt në rritjen e besimit të klientëve, stabilitetin operacional dhe vazhdimësinë e aktivitetit të bankës.

Për më tepër, në një treg financiar gjithnjë e më të dixhitalizuar, siguria e informacionit përbën jo vetëm një kërkesë teknologjike, por edhe një faktor ekonomik dhe konkurrues. Bankat që investojnë në sisteme të avancuara sigurie krijojnë avantazh konkurrues, reduktojnë riskun operacional dhe rrisin efikasitetin e menaxhimit të të dhënave dhe shërbimeve financiare.

Në këtë kontekst, konkluzioni kryesor i këtij punimi është se siguria e të dhënave bankare duhet të konceptohet si një bashkëveprim i balancuar ndërmjet software-it, hardware-it dhe menaxhimit strategjik ekonomik, duke krijuar kështu një arkitekturë sigurie të qëndrueshme, efikase dhe afatgjatë.

Metodologjia e Punimit

Metodologjia e ndjekur në këtë punim ka pasur si objektiv kryesor afrimin sa më pranë problematikave reale që lidhen me sigurinë e të dhënave në kompani dhe institucione biznesi, veçanërisht në sektorin bankar, ku mbrojtja e informacionit përbën një element kritik për funksionimin dhe stabilitetin e aktivitetit ekonomik.

Në këtë kuadër, metodologjia e aplikuar është bazuar në disa etapa kryesore studimore dhe implementuese. Fillimisht është realizuar analiza e gjendjes aktuale të infrastrukturës së rrjetit (network infrastructure), me fokus identifikimin e dobësive teknologjike, pikave të cenueshme të sigurisë dhe mënyrës së administrimit të komunikimit të të dhënave. Më pas, mbi bazën e rezultateve të analizës, janë përzgjedhur teknologji të avancuara të networking-ut dhe të sigurisë, të cilat janë propozuar për implementim në funksion të rritjes së nivelit të mbrojtjes së informacionit dhe garantimit të vazhdimësisë së operacioneve bankare.

Një pjesë e rëndësishme e metodologjisë ka qenë edhe integrimi i moduleve të reja të sigurisë në ato segmente të rrjetit ku mungonin mekanizmat adekuatë të mbrojtjes. Gjatë studimit praktik është konstatuar në disa raste përdorimi i pajisjeve të thjeshta të rrjetit, si routera të kategorisë standarde apo module të tipit “Plug and Play”, të cilat nuk ofrojnë nivele të mjaftueshme kontrolli dhe sigurie për një institucion financiar. Për këtë arsye, janë propozuar zgjidhje që konsistojnë në zëvendësimin e këtyre moduleve me pajisje të programueshme dhe të menaxhueshme, të afta për të implementuar politika të avancuara sigurie, autentifikimi dhe kontrolli të aksesit.

Nga këndvështrimi teknologjik, kjo qasje synon reduktimin e rrezikut të aksesit të paautorizuar në serverat dhe bazat e të dhënave të biznesit, si dhe rritjen e integritetit dhe konfidencialitetit të informacionit. Ndërsa nga aspekti ekonomik, implementimi i teknologjive moderne të sigurisë përfaqëson një investim strategjik afatgjatë, i cili kontribuon në minimizimin e humbjeve financiare të shkaktuara nga sulmet kibernetike, ndërprerjet operative apo kompromet imi i të dhënave sensitive.

Për më tepër, përmirësimi i sigurisë së rrjetit ndikon drejtpërdrejt në rritjen e besueshmërisë së institucionit ndaj klientëve dhe partnerëve financiarë, duke krijuar stabilitet operacional dhe avantazh konkurrues në treg. Në këtë mënyrë, metodologjia e ndjekur në këtë punim nuk trajton sigurinë e informacionit vetëm si një problem teknik, por edhe si një faktor me ndikim të rëndësishëm ekonomik dhe menaxherial për zhvillimin e qëndrueshëm të biznesit.

Pikat Kryesore Te Implementimit Te Sigurise

- Komunikimet Head Office me Filialet në Distance(Remote Control).
- Vendosja e Firewall midis Head Office dhe Bankave te tjera ne www.
- Marrja ne konsiderate dhe implementimi i Sistemit SEPA /nga pikepamja e Sigurise ne Banken lokale te Nivelit te dyte .
- Perdorimi nga klientet e wireless te bankes dhe ndryshimi i IP pasi klientet jane larguar nga Netwok –U.

Komunikimi ndërmjet Head Office dhe Filialeve në Distancë (Remote Control)

Një nga elementët më të rëndësishëm të infrastrukturës bankare moderne është realizimi i komunikimit të sigurt ndërmjet selisë qendrore (Head Office) dhe filialeve të shpërndara në distancë. Në një sistem bankar me shtrirje të gjerë gjeografike, transmetimi i të dhënave financiare dhe administrimi në kohë reale i operacioneve kërkon përdorimin e teknologjive të avancuara të komunikimit dhe kontrollit në distancë (Remote Control).Ky komunikim duhet të garantojë konfidencialitetin, integritetin dhe disponueshmërinë e të dhënave, duke minimizuar rrezikun e ndërhyrjeve të paautorizuara apo sulmeve kibernetike. Për këtë arsye, implementimi i protokolleve të sigurta të komunikimit, si VPN dhe SSH, përbën një domosdoshmëri për realizimin e lidhjeve të mbrojtura ndërmjet selisë qendrore dhe degëve të bankës.

Vendosja e Firewall-it ndërmjet Head Office dhe WWW

Një komponent thelbësor i arkitekturës së sigurisë është implementimi i firewall-it ndërmjet rrjetit të brendshëm të bankës dhe rrjetit publik global (World Wide Web – WWW). Firewall-i shërben si mekanizëm filtrimi dhe kontrolli të trafikut të rrjetit, duke monitoruar dhe kufizuar aksesin në bazë të politikave të sigurisë të përcaktuara nga institucioni bankar.

Në këtë mënyrë, firewall-i mbron serverat dhe bazat e të dhënave të bankës nga akseset e paautorizuara, malware-et dhe sulmet kibernetike, duke krijuar një shtresë të rëndësishme mbrojtjeje për infrastrukturën e informacionit. Implementimi i pajisjeve të avancuara të sigurisë, si Cisco ASA dhe sistemet e monitorimit të trafikut, rrit ndjeshëm nivelin e kontrollit dhe menaxhimit të rrjetit bankar.Nga aspekti ekonomik, përdorimi i firewall-eve dhe sistemeve të mbrojtjes redukton kostot potenciale që mund të vijnë nga incidentet e sigurisë, humbja e të dhënave, ndërprerja e shërbimeve bankare apo dëmtimi i reputacionit të institucionit financiar.

Implementimi i Sistemit SEPA nga Pikëpamja e Sigurisë

Në kuadër të integrimit të sistemit bankar lokal me standardet evropiane të pagesave, një rëndësi të veçantë merr implementimi i sistemit SEPA (Single Euro Payments Area). Për bankat lokale të nivelit të dytë, implementimi i këtij sistemi kërkon jo vetëm përshtatje teknologjike, por edhe përmbushje të standardeve të larta të sigurisë së informacionit dhe mbrojtjes së transaksioneve financiare.

Në këtë kontekst, banka duhet të implementojë mekanizma të avancuar autentifikimi, enkriptimi të të dhënave dhe monitorimi të transaksioneve, me qëllim garantimin e sigurisë së transfertave dhe mbrojtjen ndaj mashtrimeve financiare. Përputhshmëria me standardet ndërkombëtare të sigurisë ndikon drejtpërdrejt në rritjen e besueshmërisë së institucionit bankar dhe në zgjerimin e mundësive të bashkëpunimit financiar ndërkombëtar.Nga këndvështrimi ekonomik, implementimi i sigurt i sistemit SEPA rrit efikasitetin e transaksioneve, redukton kostot operative dhe përmirëson cilësinë e shërbimeve bankare për klientët dhe bizneset.

Përdorimi i Wireless-it nga Klientët dhe Menaxhimi Dinamik i IP-ve

Një komponent me rëndësi të veçantë në sigurinë e infrastrukturës bankare është menaxhimi i rrjeteve wireless të përdorura nga klientët në ambientet e bankës. Duke qenë se aksesi në këto rrjete realizohet në mënyrë të përkohshme dhe nga përdorues të ndryshëm, lind nevoja për implementimin e mekanizmave të avancuar të kontrollit dhe mbrojtjes së rrjetit, me qëllim garantimin e sigurisë së infrastrukturës së brendshme dhe të të dhënave sensitive të institucionit bankar.

Në këtë kontekst, përdorimi i sistemit **DHCP (Dynamic Host Configuration Protocol)** paraqet një zgjidhje funksionale dhe efikase për menaxhimin dinamik të adresave IP. Përmes këtij sistemi, adresat IP alokohen automatikisht për pajisjet e lidhura në rrjet dhe ri-alokohen pas përfundimit të sesionit të përdoruesit. Ky mekanizëm kontribuon në rritjen e sigurisë së rrjetit, duke reduktuar mundësinë e aksesit të paautorizuar dhe duke minimizuar rrezikun e identifikimit apo shfrytëzimit të infrastrukturës wireless nga përdorues të jashtëm.

Nga pikëpamja funksionale dhe ekonomike , implementimi i DHCP-së përfaqëson një element të rëndësishëm në administrimin modern të rrjeteve kompjuterike, pasi mundëson automatizimin e konfigurimit të rrjetit, optimizimin e menaxhimit të burimeve dhe përmirësimin e kontrollit të sigurisë në mjediset bankare dhe institucionale.

Ndarja e rrjetit wireless të klientëve nga rrjeti i brendshëm operativ i bankës përmes VLAN-eve dhe firewall-eve ka një rëndësi të dyfishtë: **siguri dhe ekonomi**, të cilat janë të ndërlidhura ngushtë në funksionimin e institucioneve financiare.

Nga **aspekti i sigurisë**, kjo arkitekturë rrjeti redukton ndjeshëm sipërfaqen e sulmit (attack surface), duke kufizuar mundësinë e depërtimit të përdoruesve të jashtëm në sistemet kritike të bankës. VLAN-et mundësojnë segmentim logjik të trafikut, ndërsa firewall-et vendosin politika strikte kontrolli mbi komunikimin ndërmjet segmenteve të rrjetit. Kjo qasje minimizon rrezikun e sulmeve si akses i paautorizuar, përhapje malware-i apo ndërhyrje në sistemet e pagesave dhe të dhënave sensitive. Si rezultat, rritet integriteti, konfidencialiteti dhe disponueshmëria e informacionit bankar.

Nga **aspekti ekonomik**, kjo strategji ka ndikim të drejtpërdrejtë në uljen e kostove të lidhura me incidentet kibernetike. Parandalimi i shkeljeve të sigurisë shmang shpenzime të mëdha për rikuperim të sistemeve, kompensime financiare, penalitete rregullatore dhe humbje reputacioni. Gjithashtu, garantimi i vazhdueshmërisë së shërbimeve (business continuity) siguron që transaksionet dhe operacionet bankare të mos ndërpriten, duke ruajtur të ardhurat dhe efikasitetin operacional. Në mënyrë indirekte, rritet edhe besimi i klientëve, çka ndikon pozitivisht në stabilitetin dhe konkurrueshmërinë e institucionit financiar në treg.

Pra , izolimi i rrjeteve përmes VLAN-eve dhe firewall-eve përfaqëson një investim strategjik që forcon sigurinë kibernetike dhe njëkohësisht mbron interesat ekonomike të bankës në afatgjatë.

PIKAT KRYESORE TE IMPLEMENTIMIT TE SIGURISE

Ne te gjitha nivelet e aksesismit te network-ut dhe serverave db te bankes te gjeneroje nepermjet kodeve te C++ password-e dinamike dhe random, ndryshimin e password-eve te administratoreve te serverave dhe ruajtjen e tyre automatike pas cdo logimi dhe perdorimi te ketyre serverave nga personat e autorizuar.

Zbatimi i një sistemi ku kredencialet e aksesit (password-et) gjenerohen në mënyrë dinamike dhe ndryshohen automatikisht pas çdo përdorimi të serverave dhe databazave bankare përfaqëson një **investim në menaxhimin e riskut operacional dhe kibernetik**.

Nga **aspekti ekonomik**, ky mekanizëm ul ndjeshëm probabilitetin e ndodhjes së incidenteve të sigurisë, të cilat zakonisht sjellin kosto të larta direkte dhe indirekte për institucionin financiar. Kostot direkte përfshijnë rikuperimin e sistemeve, hetimet teknike dhe kompensimet e mundshme, ndërsa kostot indirekte lidhen me humbjen e reputacionit, rënien e besimit të klientëve dhe uljen e aktivitetit financiar.

Në këtë kuptim, ndryshimi automatik i kredencialeve pas çdo aksesimi funksionon si një **politikë parandaluese e humbjeve**, duke reduktuar ekspozimin e bankës ndaj sulmeve të brendshme ose të jashtme dhe duke kufizuar kohëzgjatjen e vlefshmërisë së një kredenciali të kompromentuar. Kjo rrit stabilitetin e operacioneve dhe siguron **vazhdimësi të shërbimeve bankare**, që është një faktor kyç për ruajtjen e të ardhurave dhe efikasitetit.

Në aspektin e **menaxhimit financiar të riskut**, një sistem i tillë mund të konsiderohet si një formë e "sigurimit operacional", ku një investim i vogël në automatizimin e sigurisë (përmes teknologjisë) sjell reduktim të konsiderueshëm të humbjeve potenciale. Kjo e përmirëson profilin e riskut të institucionit dhe rrit besimin e investitorëve dhe klientëve.

Nga ana teknologjike, ky proces realizohet përmes gjenerimit të kredencialeve të rastësishme dhe rotacionit automatik të tyre, të integruar në sistemet e menaxhimit të aksesit. Megjithatë, vlera kryesore nuk qëndron vetëm në teknologji, por në **efektin ekonomik të uljes së riskut dhe rritjes së qëndrueshmërisë financiare të bankës**.

KOMUNIKI I HEAD OFFICE ME FILIALET

- **PER KOMUNIKIMET NE DISTANCE ZGJIDHJET E REALIZUARA :**
- **IMPLEMENTIMI I SSH**
- **IMPLEMENTIMINI I NAT**
- **IMPLEMENTIMI I IP BURIM DHE IP DESTINACION**
- **VENDOSJA E PASSWORD PER SSH SERVER**
- **VENDOSJA E TIMEOUT PREJ 5 MIMUTASH**

Zgjidhjet e implementuara për komunikimet në distancë, si **SSH**, **NAT**, kontrolli i **IP burim/destinacion**, vendosja e **password-it për SSH server** dhe **timeout 5 minuta**, përbëjnë një strukturë bazë për sigurinë dhe efikasitetin e rrjetit.

SSH (Secure Shell) siguron komunikim të enkriptuar midis përdoruesit dhe serverit, duke parandaluar ndërhyrjet dhe vjedhjen e të dhënave gjatë aksesit në distancë. Kjo ul rrezikun e sulmeve dhe mbron informacionin kritik të institucionit.

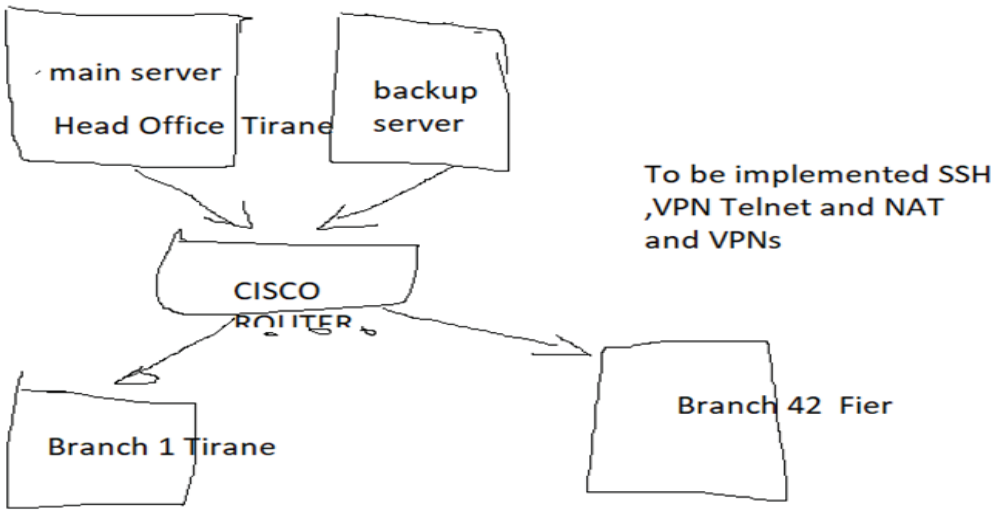
NAT (Network Address Translation) ndihmon në fshehjen e adresave të brendshme të rrjetit, duke rritur sigurinë dhe duke optimizuar përdorimin e IP-ve. Kjo redukton ekspozimin direkt të sistemeve të brendshme ndaj internetit.

Kontrolli i **IP burim dhe IP destinacion** lejon filtrimin e trafikut dhe aksesin vetëm nga burime të autorizuara, duke ulur ndjeshëm rrezikun e aksesit të paautorizuar.

Vendosja e **password-it për SSH server** forcon kontrollin e aksesit dhe siguron që vetëm përdoruesit e verifikuar mund të hyjnë në sistem.

Timeout prej 5 minutash ndihmon në mbylljen automatike të sesioneve joaktive, duke reduktuar rrezikun e keqpërdorimit të aksesit të lënë hapur.

Diagrama e Kapitullit



Kryesoret per implementimin e SSH:

IP e server SSH/head office administrator 10.10.10.1

Porta fizike e implementimit te SSH 23 ne linjat VTY

Admin password: ubankelti2002

Procesi qe mbrohet , trasferimi i fileve me ane te aksesite te FTP server te sigurte tunelimi dhe enkriptimi gre me qellim realizimin e VPN

Tuneling është një zgjidhje që i vendos file ose paketat brenda disa paketave që shkëmbehen apo trasmetohen mbi një network të personalizuar , në tunele virtual plus janë të enkapsuluara dhe të pa deshifrueshme nga të tjerët por vetëm nga dy IP e dedikuara në këtë tunel.Me fjalë të tjera këto dy IP e vendosura në tunel do jenë, IP destinacion do jetë Serveri qendror në head office Tiranë që do marri kopjen e të dhënave dhe transaksioneve të bera nga filiali i Fierit , ku serveri i të dhënave te filialit Fier do jetë IP burim apo sic quhet me term standart IP Sourse.

Tunneling është një mënyrë e sigurt komunikimi që dërgon të dhënat përmes një kanali virtual të enkapsuluar midis dy pikave të rrjetit. Në këtë rast, të dhënat nga filiali i Fierit (IP burim) dërgohen te serveri qendror në Tiranë (IP destinacion), duke garantuar që informacioni të mos lexohet nga palë të treta gjatë transmetimit.

Nga pikëpamja ekonomike, tunneling kontribuon në uljen e kostove të lidhura me menaxhimin e incidenteve të sigurisë dhe ndërprerjeve të shërbimeve. Duke garantuar një transmetim të sigurt dhe të qëndrueshëm të të dhënave midis degëve, ai ndihmon në shmangien e humbjeve financiare që mund të vijnë nga rrjedhja e informacionit ose manipulimi i transaksioneve. Gjithashtu, përmirëson eficiencën operacionale dhe mbështet stabilitetin afatgjatë të institucionit, duke ruajtur besimin e klientëve dhe reputacionin e bankës në treg.

KAPITULLI FIREWALL DHE DMZFIREWALL I IMPLEMENTUAR I TIPIT CISCO ASA

Muri mbrojtës (Firewall) përfaqëson një mekanizëm kryesor sigurie që mbron rrjetin e brendshëm të bankës nga akseset e paautorizuara dhe sulmet kibernetike. Ai implementohet përmes një pajisjeje harduerike (p.sh. Cisco Firewall) në hyrje të rrjetit dhe më pas konfigurohet në nivel software për të kontrolluar dhe filtruar trafikun.

Ky sistem lejon vetëm daljen e trafikut të autorizuar përmes IP-ve të maskuara me NAT, ndërsa bllokon hyrjet nga IP të panjohura ose të paautorizuara. Gjithashtu, ai filtron dhe kufizon protokollet e komunikimit si TCP/UDP dhe akseset në shërbime të ndjeshme si SQL, duke reduktuar ndjeshëm rrezikun e ndërhyrjeve dhe sulmeve në databazat bankare.

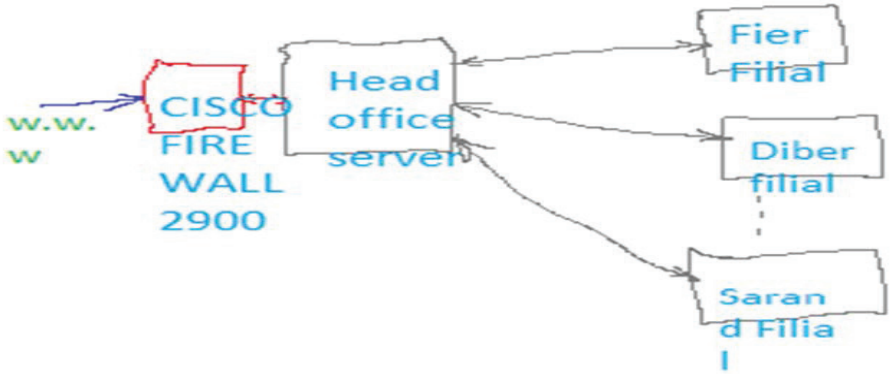
Rëndësia ekonomike qëndron në faktin se firewall-i minimizon mundësinë e incidenteve të sigurisë që mund të shkaktojnë humbje të mëdha financiare, ndërprerje të shërbimeve dhe dëmtim të reputacionit të bankës. Në këtë mënyrë, ai kontribuon në uljen e kostove të rikuperimit pas sulmeve dhe siguron një funksionim të qëndrueshëm dhe të besueshëm të sistemit bankar.

KAPITULLI I MURIT MBROJTESASA FIREWALL AND DMZ

Është përzgjedhur një firewall i teknologjisë së avancuar të tipit Cisco ASA, i cili ofron funksione të plota për filtrimin e trafikut hyrës dhe dalës të rrjetit bankar, duke rritur nivelin e sigurisë dhe kontrollit të aksesit.

Gjithashtu është trajtuar edhe NAT (Network Address Translation), i cili në kombinim me Cisco ASA rrit ndjeshëm sigurinë e rrjetit duke maskuar adresat e brendshme.

DIAGRAMA E FIREWALL



KODI I ZBATUAR PER FIREWALL ASA TIP 5506

UBANK - ASA-Init(config)# hostname UBANK-ASA-FIREËALL

UBANK-ASA(config)# password ELTI-adm-2002

Konfigurohet nderfaqe tip Gi1/2 (gigaethernet) e fireëall për rrjetin inside netëork (192.168.1.0/24) dhe vendoset niveli I sugurise 100 (highest) më I larti

UBANK -ASA(config)# interface gi1/2

UBANK -ASA(config-if)# nameif inside

UBANK -ASA(config-if)# ip address 192.168.1.1 255.255.255.0

UBANK -ASA(config-if)# security-level 100

UBANK -ASA(config-if)# no shutdoën

Konfigurohet ASA të lejojë lidhjet SSH për administratorin me ip (10.10.10.1 /24) për menaxhimin nga distanca për filialin e Fierit me ip (10.10.10.7) që konsiderohet si outside network dhe vendosim SSH timeout 5 minuta .

UBANK -ASA(config)# ssh 10.10.10.1 255.255.255.0 inside

UBANK -ASA(config)# ssh 10.10.10.7 255.255.255.0 outside

UBANK -ASA(config)# ssh timeout 5

Dhe së fundmi do konfigurojmë një NAT tek DMZ, me qëllimin që IP e administratorit sa herë që do aksesoj në distance filialet , IP vërtet e administratorit nuk do jetë ajo e vërteta në e www IP reale 10.10.10.0 do të shfaqet ne www si të ishte 209.165.200.227 .

UBANK -ASA(config)# object network dmz-server

UBANK -ASA(config-network-object)# host 10.10.10.0

UBANK -ASA(config-network-object)# nat (dmz,outside) static 209.165.200.2

Në këtë pjesë të konfigurimit të Cisco ASA firewall, pajisjes i është vendosur një emër për ta identifikuar më lehtë dhe një fjalëkalim për siguri.

Më pas është konfiguruar porta GigabitEthernet1/2, e cila përdoret për rrjetin e brendshëm të bankës (inside network).

Kësaj ndërfaqe i është caktuar adresa IP 192.168.1.1, e cila shërben si adresa kryesore e rrjetit të brendshëm. Gjithashtu është vendosur niveli i sigurisë më i lartë (security-level 100), duke treguar se ky rrjet është plotësisht i besuar. Në fund, ndërfaqja është aktivizuar me komandën “no shutdown”, në mënyrë që të funksionojë normalisht.

FILTRIM I TRAFIKUT INBOND

FILTRIMI I TCP , UDP , SQL-net

KAPITULLI I NDRYSHIMIT DHE GJENERIMIT I PASWORDEVE NE MENYRE DINAMIKE

Në këtë projekt është realizuar një sistem për gjenerimin automatik të fjalëkalimeve të rastësishme duke përdorur gjuhën programuese C++. Qëllimi kryesor është rritja e sigurisë së aksesit në sisteme, veçanërisht në mjedise si Windows Server.

Programi fillon me një menu të thjeshtë, ku përdoruesi zgjedh nëse do të gjenerojë një fjalëkalim ose të dalë nga sistemi. Në rastin e gjenerimit, përdoruesi përcakton gjatësinë e fjalëkalimit (në këtë rast 16 karaktere), dhe programi krijon një kombinim të rastësishëm me shkronja, numra dhe simbole.

Për implementim janë përdorur konceptet bazë të C++ si loops, arrays, switch-case, si dhe funksionet rand() dhe libraria <ctime> për gjenerimin e vlerave të rastësishme bazuar në kohën e sistemit. Gjithashtu është përdorur <iostream> për ndërveprimin me përdoruesin.

Ky mekanizëm ndihmon në krijimin e fjalëkalimeve më të sigurta dhe më pak të parashikueshme, duke rritur nivelin e përgjithshëm të sigurisë në sistem.

```
int main()
{
  int opt, length;
  //Menu
  do {
    cout << "\n----------------------------\n";
    cout << "  GJENERO PASS RASTESOR\n";
    cout << "----------------------------\n\n";
    cout << "    1. Generate Password"
<< "\n";
    cout << "    2. Exit"
<< "\n\n";
    cout << "Press key 1 to Generate Password and key 2 to exit: ";
    cin >> opt;
switch (opt) {
    case 1:
      cout << "Enter Length:  ";
      cin >> length;
```

```
        //if the length is less than 12, the program  will show an error
        if (length < 12) {
           cout << "\nError: Password Length Should be at least 12\n";
           cout << "Press any key to try again \n";
           getchar();
        }
else if (length > 16) {
           cout << "\nError: Maximum length of password should be 16\n";
           cout << "Press any key to try again \n";
           getchar();
        }
        //Otherwise call generate_password() function to generate password
        else
           generate_password(length);
        break;
if (opt != 2) {
           cout<<"\nInvalid choice\n";
           cout<<"Please Press ( 1 ) to generate password and ( 2 ) to exit.\n";
           cout << "Press any key to try again \n";
           getchar();
        }
        break;
     }
  } while (opt != 2);
  return 0;
}
if ((count_ALPHABET == 2) && (count_number == 0 || count_alphabet == 0 count_alphabet
== 1 || count_s_symbol == 0))
           break;
        key = getKey();
        password = password + ALPHABET[key];
        count_ALPHABET++;
        count++;
        break;
     case 3:
```

KRYESORET PER IMPLEMENTIMIN E PASS DINAMIKE

Kur administratori vendos fjalëkalimin dhe shtyp Enter për konfirmim, një modul Arduino i lidhur në portën seriale të serverit aktivizon automatikisht funksionin kryesor të sistemit. Ky modul shërben si ndërfaqe fizike ndërmjet përdoruesit dhe programit, duke mundësuar nisjen e procesit të ndryshimit të fjalëkalimit.

Sistemi merr si bazë fjalëkalimin ekzistues "ubankelti2002" dhe e përpunon atë duke shtuar karaktere të rastësishme, duke rritur kompleksitetin dhe sigurinë e tij. Procesi i implementuar në C++ ndjek një rrjedhë të strukturuar: **Admin Authentication → Change Password → Insert Old Password → Set New Password → Confirm New Password**. Pas përfundimit të suksesshëm të procesit, fjalëkalimi i ri ruhet në një file Notepad të administratorit për dokumentim dhe administrim të mëtejshëm.

Ky mekanizëm kombinon ndërveprimin harduer-software dhe rrit nivelin e sigurisë në menaxhimin e aksesit në sistem.

KONKLUZIONE

Siç është theksuar në fillim të këtij punimi , përzgjedhja dhe implementimi i moduleve të avancuara të teknologjisë Cisco, të cilat ofrojnë mundësi të plota konfigurimi dhe programimi në nivele të ndryshme të arkitekturës së rrjetit bankar, kontribuon ndjeshëm në rritjen e nivelit të sigurisë së sistemit. Integrimi i këtyre zgjidhjeve mundëson një menaxhim më të kontrolluar të trafikut dhe një mbrojtje më efektive të infrastrukturës së serverave.

Gjithashtu, gjenerimi dinamik i fjalëkalimeve për aksesin në serverat e bazave të të dhënave (DB) të bizneseve, së bashku me mekanizmat e maskimit të IP-ve reale të administratorëve gjatë aksesit në internet, përbëjnë elementë të rëndësishëm të sigurisë kibernetike. Këto teknika reduktojnë ndjeshëm ekspozimin e informacionit kritik dhe rrisin anonimitetin gjatë komunikimit në rrjet.

Në këtë mënyrë, monitorimi i aktiviteteve të serverave nga palë të paautorizuara, përfshirë sulmuesit kibernetikë, bëhet shumë më i vështirë, duke e bërë praktikisht të pamundur depërtimin dhe kompromet imin e të dhënave sensitive të biznesit.

REKOMANDIME

Së pari, një rëndësi të veçantë ka të menduarit në mënyrë dinamike nga ana e administratorëve të sistemeve të bizneseve, si dhe përditësimi i vazhdueshëm i niveleve të sigurisë. Administratorët nuk duhet të udhëhiqen nga ideja se zgjidhjet ekzistuese janë të mjaftueshme, por duhet të jenë vazhdimisht në proces përmirësimi dhe përshtatjeje me kërcënimet e reja kibernetike. Kjo është veçanërisht e rëndësishme duke pasur parasysh se sulmuesit kibernetikë disponojnë njohuri të avancuara dhe mund të monitorojnë në mënyrë të vazhdueshme fluksin e komunikimeve në rrjetet e bizneseve.

Së dyti, administratorët e të dhënave duhet të kryejnë matje të sakta të kohës së aksesit në serverat bankarë, si dhe të kohës së nevojshme për kopjimin ose transferimin e skedarëve. Bazuar në këto analiza, ata duhet të personalizojnë parametrat e komunikimit standard të sistemit, duke vendosur kohë të përshtatshme për çdo sesion (timeout). Kjo qasje kontribuon në rritjen e sigurisë duke kufizuar kohën e ekspozimit të sistemit ndaj aksesit të paautorizuar dhe duke kontrolluar më mirë ndërveprimet me serverat.

Së treti, në lidhje me punonjësit e bankës, të cilët përfshijnë ekonomistë dhe bankierë, është e domosdoshme që ata të instruktohen dhe të ndjekin rregulla të qarta të punës në lidhje me

përdorimin e sistemeve kompjuterike të institucionit. Një nga masat më të rëndësishme të sigurisë është kufizimi i përdorimit të kompjuterëve të dedikuar për veprimet bankare vetëm për qëllime profesionale, duke shmangur navigimin në internet për qëllime personale si leximi i lajmeve ose përdorimi i rrjeteve sociale gjatë orarit të punës.

Kjo masë është e rëndësishme pasi aksesimi i faqeve të ndryshme në internet rrit rrezikun e ekspozimit ndaj sulmeve kibernetike, ku mund të kompromet ohen të dhënat e përdoruesve, përfshirë adresat IP dhe kredencialet e aksesit. Nëpërmjet këtyre metodave, sulmuesit mund të përpiqen të depërtojnë në sistemet e brendshme të bankës dhe të rrezikojnë integritetin e të dhënave.

Për këtë arsye, administrata e sistemeve të sigurisë mund të implementojë edhe filtra (content filtering) që kufizojnë aksesin në faqe të caktuara si Facebook, Instagram, X (Twitter), TikTok dhe platforma të tjera të ngjashme, duke lejuar vetëm aksesin në burime të autorizuara dhe të nevojshme për punën. Kjo kontribuon në rritjen e sigurisë së përgjithshme të infrastrukturës bankare dhe redukton ndjeshëm rreziqet e sulmeve të mundshme kibernetike.

Digital Transformation and Artificial Intelligence: Economic, Legal, and Social Perspectives

Dhurata Saraçi

University College of Business

Abstract

The rapid digital transformation of economic and social structures, propelled by the integration of Artificial Intelligence (AI), has created a dual-reality where personal data serves as the primary engine for innovation while simultaneously becoming a critical vulnerability for legal certainty. This paper explores the "privacy expropriation" risks inherent in AI-driven systems, where advanced profiling and predictive analytics often bypass traditional consent mechanisms, leading to a loss of individual autonomy over digital identities.

The core legal problem analyzed is the opacity of algorithmic processing, the "black-box" effect, which complicates the oversight of data protection principles. Within the European legal landscape, these challenges directly collide with Article 8 of the European Convention on Human Rights (ECHR). By examining the landmark jurisprudence of the European Court of Human Rights, specifically the case of Big Brother Watch and Others v. the United Kingdom (2021), this study highlights the Court's shift toward requiring stricter "end-to-end" safeguards and independent authorization for bulk data interception. The Court's ruling serves as a vital precedent, asserting that digital surveillance and automated data processing without robust, transparent oversight are incompatible with the standards of a democratic society.

To mitigate these risks, the paper proposes a multi-layered regulatory solution. First, it advocates for the mandatory implementation of "Privacy by Design" and "Privacy by Default" within AI architectures. Second, it emphasizes the need for Algorithmic Accountability, requiring entities to provide meaningful explanations of the logic behind automated decisions. Finally, the study argues that aligning national frameworks with the EU AI Act is essential to ensure that digital transformation fosters progress without compromising the fundamental right to privacy and human dignity.

***Keywords**: Digital Transformation, Artificial Intelligence, Personal Data Protection, ECHR, Privacy by Design, Algorithmic Accountability*.

I. Artificial Intelligence as a Driver of Technological Developments

Digital transformations are continuously changing how people live, work and function in their societies. These applications of technology can be noticed in education, transportation, data storage, communications and healthcare, among other fields.

The development and use of digital technologies is also impacting how governments operate and function. Digital transformation, including artificial intelligence (AI) adoption, has become one of the highest priorities for public organisations. For instance, governments are increasingly trying to digitize their services through technology because of growing public expectations (UNESCO, 2023).

As industries and customer expectations evolve, businesses face mounting pressure to leverage emerging technologies that provide a competitive edge. Today, that often means having a clear strategy for using artificial intelligence (AI) and generative AI to develop new products and services, streamline operations, boost productivity, and avoid falling behind. Digital transformation is the process of adopting new technologies to fundamentally reshape how your business operates and creates value. It often involves:

1. Rethinking business models;
2. Optimizing operations;
3. Improving customer experiences.

It's not simply driven by technology but rather by addressing inefficiencies, enhancing agility, and making data-driven decisions (Gibson, 2024).

The emergence of new regulations also continues to demonstrate the importance of improving the innovation capacity of enterprises. In this context, digital transformation has become the core driving force to promote enterprises' continuous innovation and development. With the rapid advancement of information technology, enterprises are faced with unprecedented opportunities and challenges, and they also need to capitalize on the potential capabilities of digital transformation to improve their competitiveness and foster sustainable, high-quality economic development. By leveraging cutting-edge digital technologies like cloud computing, big data, and artificial intelligence (AI), enterprises can significantly enhance their productivity and innovate their products and services, leading to improved performance (Wang et al., 2025). To unlock the potential of digital government, establishing the right institutional arrangements, coordination mechanisms and policy instruments is critical to sustaining the needed long-term transformations and overcoming changing political priorities. The OECD Digital Government Policy Framework establishes six dimensions critical for establishing a digital government:

1. **Digital by design:** designing policies to enable the public sector to use digital tools and data in a coherent way when formulating policies or transforming public services.
2. **Data-driven:** developing the governance and enablers needed for data access, sharing and re-use across the public sector.
3. **Government as a platform:** deploying common building blocks such as guidelines, tools, data, digital identity and software to advance a coherent transformation of government processes and services across the public sector.
4. **Open by default:** openness beyond the release of open data, including efforts to encourage the use of technologies and data to communicate and engage with different actors.
5. **User-driven:** placing user needs at the core of the design and delivery of public policies and services, including through engagement with users and measurement of metrics to assess impact and satisfaction.
6. **Proactiveness:** anticipating the needs of users and service providers to deliver government services proactively (OECD, 2025).

Digital governance success is not merely a matter of technology adoption, but rather of the capability to institutionalize these principles within a robust legal and regulatory framework.

II. Transforming Public Governance through AI

AI can collect and analyze vast amounts of data that enable governments to understand societal needs and respond to them with unprecedented speed and precision. AI can also monitor policy performance dynamically, forecast emerging challenges, and optimize resource allocation to prioritize urgent issues. The result could be faster and more evidence-based decisions and more proactive, precisely tailored policy interventions. AI is redefining governance across three interconnected spheres: internal administrative efficiency, data-driven policy formulation, and transformative public service delivery. For administration, AI can automate repetitive and time-consuming tasks, and thereby increase efficiency and reduce human error. AI-driven task

management systems can automate scheduling, generate reports, and send reminders, freeing up human resources to focus on more complex and strategic activities. In medicine, for example, doctors save time on clinical documentation by automating appointment scheduling, billing coding, and clinical documentation, freeing them to focus more on patient care. This automation not only improves productivity but also ensures greater consistency and accuracy (UNDP, 2025).

The dimensions of AI in the public sector must align with the larger organizational settings and priorities of public administrations. AI's application encompasses three major aspects: enhancing internal processes, improving public service delivery, and fostering governance transparency. These efforts must be framed within existing organizational practices, as public managers remain ultimately accountable for decisions made, even when AI systems are involved. To support these dimensions, new organizational forms such as AI laboratories and innovation labs have emerged, providing safe environments for testing and refining AI technologies. These labs facilitate capacity building and address organizational challenges by integrating AI into workflows and decision-making processes. By aligning AI strategies with organizational goals and structures, public administrations can maximize the transformative potential of AI while ensuring accountability and effective service delivery (Mendhe, 2025).

Consequently, the integration of AI through innovation labs demonstrates that public modernization requires not just new tools, but a revised management culture where institutional strategies align with organizational goals without compromising human accountability.

III. The International Legal Framework and the Impact of Global Standards on Artificial Intelligence Regulation

The AI Act is the first-ever legal framework on AI, which addresses the risks of AI and positions Europe to play a leading role globally. The AI Act (Regulation (EU) 2024/1689 laying down harmonized rules on artificial intelligence is the first-ever comprehensive legal framework on AI worldwide. The aim of the rules is to foster trustworthy AI in Europe (European Commission, n.d.).

The purpose of the Regulation of the European Parliament and of the Council laying down harmonized rules on artificial intelligence and amending Regulations is to improve the functioning of the internal market and promote the uptake of human-centric and trustworthy artificial intelligence (AI), while ensuring a high level of protection of health, safety, fundamental rights enshrined in the Charter, including democracy, the rule of law and environmental protection, against the harmful effects of AI systems in the Union and supporting innovation (European Parliament & Council of the European Union, 2024).

First, AI systems affect privacy and personal data. The Universal Declaration of Human Rights declared that *"No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks."* (Article 12) However, generative AI raises several concerns related to the right to privacy. The longest and most sustained human rights debate on automated data processing and algorithms relates to the right to privacy. This issue derives from the massive data source necessary for the operation of AI systems. In other words, the input data is the essential factor for their functionality and performance. Through a series of algorithms and data, AI systems can solve prompts, create new outputs, have conversations, or make predictions. These algorithms are mathematical, logical commands with step-by-step instructions on how to process the input data. Thus, AI systems must collect extensive data from users, especially personal data, to learn and perform tasks. This data can

include personal information such as names, addresses, financial information, and sensitive information such as medical records and social security numbers (Pham Thi Minh Trang, 2025).

The adoption of the General Data Protection Regulation (GDPR) was a revolution in terms of data protection but also in how society perceived technology. As a result, the EU Data Protection Directive was substituted by the General Data Protection Regulation (GDPR) in 2016, effective from May 2018. The aim of GDPR was, summarily, ensuring a comprehensive and directly applicable set of rules for regular personal data processing in both public and private sectors, empowering individuals who those personal data refer (i.e., data subjects) in the exercise of control over and of their rights pertinent to the processing of data. Furthermore, GDPR has also entrusted specially designated authorities independent from the executive with vast powers to supervise the overall implementation of the provisions, and even impose astronomic fines in cases of non-compliance (Organization for Security and Co-operation in Europe Presence in Albania, 2022).

The analysis of international acts and global standards is essential to understanding how multilateral instruments guide states toward a harmonized regulatory system that ensures the safe and ethical development of algorithmic systems.

IV. Harmonization of Albanian Legislation with the Digital Age: Challenges of Regulating Artificial Intelligence

The process of Albania's European integration has entered a new and dynamic phase, where the alignment of the domestic regulatory framework with the latest European Union standards constitutes an essential condition for the country's progress on its path toward full membership.

Albania's obligation to harmonize its legislation with the EU AI Act arises primarily from the EU accession negotiations and the broader process of approximation with the Union's *acquis*. The AI Act falls under Chapter 10 – Digital Transformation and Media, which is part of the Competitiveness and Inclusive Growth cluster of negotiation chapters. With the formal opening of negotiations for this cluster in May 2025, the EU issued its Common Position, which provides that: "The EU notes Albania's partial alignment with the EU *acquis* related to digital transformation. The EU welcomes Albania's high level of alignment with the *acquis* related to electronic identification, open data, and broadband. The EU invites Albania to strengthen efforts to fully align with the *acquis* in the area of digital transformation and notably cybersecurity. In addition, the EU invites Albania to align with the EU Artificial Intelligence Act." (Center Science and Innovation for Development, 2026).

The journey of Albania towards digitalization is firmly aligned with the EU Digital Strategy, as the country moves actively to integrate its economy and society with European standards. The EU Commission's 2030 Digital Compass serves as a guideline for this alignment, focusing on four key priorities: skills, digital infrastructure, digital transformation of businesses, and digitalization of public services. In the last few years, the Albanian government has taken significant steps to shift from traditional offline services to digital platforms, building electronic systems, digitizing archives, and expanding public e-services on platforms like e-Albania, offering 95% of the services for its citizens online/digitally (UNDP, 2025).

E-Albania was implemented and launched in 2015. It had 400 government services online, including tax filings, vehicle registrations, business licenses, civil records, etc. By centralizing multiple public services under one portal, the government aimed to reduce bureaucratic barriers and improve administrative performance. In 2022, 1,570 services were integrated into the platform. This reflects a steady increase in the digitalization of government services, with adoption rates growing consistently over the years (Prifti & Sinoimeri, 2025).

On July 15, a severe cyberattack targeted the digital infrastructure in Albania. Initially perceived as a ransomware attack, it was soon revealed to be a decoy for a wiper attack aimed at annihilating the entire digital environment, including eAlbania. The primary objective of the attackers was not merely to disrupt files but to incapacitate the entire system. In response, the IT team promptly isolated the infrastructure and shut down all critical systems to prevent further damage (Kolleshi Syziu & Botusha, 2025).

Although much has been achieved, Albania's progress could be further enhanced in three ways:

- Public services can be further re-designed to make them even more "user-friendly".
- Public sector innovations could become even more inclusive. There are still aspects of a "social and digital divide" among some socioeconomic groups, and in the most rural parts of the country.
- The newest public sector and technological innovations could be further harnessed (World Bank, 2024).

While the e-Albania platform marks a revolutionary advancement in reducing red tape, the subsequent cyberattack underscores the critical imperative of establishing more robust regulatory and technical frameworks, demonstrating that digital environmental security is as paramount as service accessibility.

V. The Legal Framework of Digital Public Services in Albania

The Albanian Constitution stipulates that human rights are the core of the public administration in the country. Article 15 of the Constitution requires public authorities to actively ensure and respect fundamental rights and freedoms, so any AI use practice or AI-related policies, including laws and sublegal rules need to reflect and respect human rights. This foundation serves as a guide and limitation to any respective legal effort. The Albanian framework establishes a transparent and effective legal structure for providing public services in digital form. The core procedural legislation for the wholeness of public administration, the Albanian Code of Administrative Procedures, establishes the core principles for public administration and serves as the foundation for electronic service delivery. Law no. 43/2023 "On Electronic Governance" defines the technical aspects of the electronic governance and obligations that the public authorities and private subjects must respect to offer their services (Methasani Eralda & Mazelliu, 2025).

Albania, as an inseparable part of the global information ecosystem, is committed to facing the challenges and embracing the opportunities offered by cyberspace, in order to ensure a safe and trustworthy digital environment for its citizens, businesses, and institutions. National Cybersecurity Strategy 2025-2030 is an important document that reflects this commitment and sets out the strategic directions for the development and strengthening of cybersecurity in Albania. The main objective of this strategy is to strengthen national capacities to identify, prevent, and manage cyber threats, including the protection of critical and important information infrastructures, the protection of sensitive data, and the guarantee of the continuity of digital services (National Cyber Security Authority, 2025).

The Digital Agenda for Albania 2022–2026 aims to boost investments in key areas of advanced computing and data processing, artificial intelligence (AI), cybersecurity, and the advanced digital skills needed to develop them. It has the potential to connect businesses, the public administration, and citizens with the latest technologies and resources, and will help the country remain globally competitive and strategically autonomous, while developing and driving society toward Digital Transformation (Council of Ministers of the Republic of Albania, 2022).

On 7 May 2026, the Parliament of Albania approved the law "On Electronic Identification, Trust Services, and the Digital Identity Wallet".Fully aligned with the European Union's eIDAS1 and eIDAS2 Regulations, this law represents a significant step toward strengthening the security and reliability of digital services in Albania, while also advancing the country's European integration process.

One of the law's key innovations is the establishment of the Digital Identity Wallet, an electronic identification tool that will be provided free of charge to citizens. For the first time within the Albanian legal framework, a secure, practical, and comprehensive electronic identification solution is introduced, enabling users to securely store, manage, and verify identification data and electronic attestations of attributes, including digital identity documents, driving licenses, diplomas, electronically sealed documents, and other electronic records (National Cyber Security Authority of Albania, n.d.). Digital transformation marks great benefits, but it also brings risks to human rights. The violation of privacy and personal data is the main concern. Mass profiling systems can collect data without the individual's knowledge or consent. In the absence of proper safeguards, information can be misused by state or private actors, compromising the citizen's digital autonomy.

On 19 December 2024, the Parliament of the Republic of Albania passed Law No. 124/2024, titled "*On Personal Data Protection*". This legislation aims to align Albania's legal framework with the European Union's standards, particularly by incorporating Regulation (EU) 2016/679 (the General Data Protection Regulation, or GDPR) and Directive (EU) 2016/680, both of which address the protection of personal data in various contexts, including criminal law enforcement. The Data Protection Law establishes the rules for safeguarding individuals' personal data and aims to protect fundamental human rights and freedoms, particularly the right to personal data protection (DLA Piper, 2025).

Albania is rapidly building a dynamic legal and strategic ecosystem aimed at regulatory approximation with European standards, while simultaneously creating a secure digital environment.

VI. The Multidimensional Challenges of AI

The integration of artificial intelligence in Albania presents critical structural challenges, primarily driven by a stark digital divide where a vast majority of the population lacks advanced digital literacy, risking the exclusion of rural and older demographics from automated public services. Economically, rapid AI deployment threatens to displace workforce sectors like administration, customer service, and entry-level tech roles faster than local retraining programs can adapt. Institutionally, the lack of a dedicated national AI framework leaves data protection and algorithmic accountability reliant on fragmented, newly updated laws like Law No. 124/2024 *"On the Protection of Personal Data"*. Furthermore, automating processes using historically flawed public data risks institutionalizing systemic inefficiencies, while a heavy reliance on foreign cloud infrastructure introduces heightened cybersecurity vulnerabilities and threatens long-term national data sovereignty.

The main disadvantages of artificial intelligence can be summed up as follows:

1. High costs;
2. Lack of creativity;
3. Unemployment;
4. They make people lazy;
5. No ethics;

6. No emotions;

7. There is no improvement (Mediterranean University of Albania, n.d.).

In a landmark decision on mass surveillance, the European Court of Human Rights held that the UK's bulk interception regime violated the right to privacy for its lack of sufficient oversight and safeguards.

In 2013, former U.S. National Security Agency employee Edward Snowden leaked information that revealed that the United States and other governments use a wide range of techniques to spy on people at home and abroad. The public also learned that the UK has a mass surveillance program that allows it to acquire enormous amounts of personal information without a person's consent or knowledge, including both the content and metadata of communications. Four NGOs brought a case to the European Court of Human Rights. The Justice Initiative has intervened in the case, arguing that such untargeted, invasive, and widespread mass surveillance seriously interferes with the right to privacy. As a result, it requires enhanced preconditions and other safeguards to ensure that it is done in accordance with the law and only when strictly necessary (Open Society Justice Initiative, n.d.).

This judgment fundamentally alters the existing balance in Europe between the right to respect for private life and public security interests, in that it admits non-targeted surveillance of the content of electronic communications and related communications data, and even worse, the exchange of data with third countries which do not have comparable protection to that of the Council of Europe States. This conclusion is all the more justified in view of the CJEU's peremptory rejection of access on a generalised basis to the content of electronic communications, its manifest reluctance regarding general and indiscriminate retention of traffic and location data, and its limitation of exchanges of data with foreign intelligence services which do not ensure a level of protection essentially equivalent to that guaranteed by the Charter of Fundamental Rights. On all these three counts, the Strasbourg Court lags behind the Luxembourg Court, which remains the lighthouse for privacy rights in Europe.

With the present judgment, the Strasbourg Court has just opened the gates for an electronic "Big Brother" in Europe (European Court of Human Rights, 2021).

Firstly, the fairness of the system becomes paramount in relation to the right to non-discrimination. It is often categorized as a risk for rights, which poses a significant challenge to people's lives. AI-DRIVEN discrimination arises from biased data, flawed system design, and developer biases. It is primarily associated with 'bias', defined as prejudice towards certain individuals, objects or positions, which can manifest itself in data, algorithms and statistical analyses.Recitals 12 and 54 of the AI Act warn that self-learning capabilities may reinforce biases, potentially leading to systemic discrimination. The ethical deployment of AI hinges on ensuring that these systems do not perpetuate biases or inequalities (Brill, n.d.).

Artificial intelligence is not merely changing the tools we use, but fundamentally reshaping how we live, work, and make decisions, placing upon us the historical obligation to guide this transformative power toward human progress rather than human displacement.

VII. Conclusions

Analysis of the regulatory framework demonstrates that Artificial Intelligence constitutes a major legal priority, with the EU AI Act ($Regulation\ (EU)\ 2024/1689) and the Council of Europe Framework Convention establishing the global standard for human rights protection. According to OECD principles, successful digital governance depends not on the mere adoption of technology, but on maintaining human accountability within public administration. In this context, Albania's path toward EU integration advanced significantly with the opening of

negotiations for the Competitiveness Cluster in May 2025. Although the e-Albania platform offers 95% of services online, the destructive wiper cyberattacks proved that cybersecurity is just as imperative as accessibility. To address these challenges and in line with Article 15 of the Constitution, Albania has strengthened its protective barriers through the new Personal Data Protection Law No. 124/2024 (GDPR).

On this basis, it is recommended that Albanian authorities draft a specific national law on AI to fully transpose the European regulation and prohibit unchecked profiling in the public sector. In alignment with the National Cybersecurity Strategy 2025–2030, capital investments in critical infrastructure must be scaled up through defensive AI monitoring systems. Procedurally, no algorithmic system should be permitted to make autonomous executive administrative decisions; the Code of Administrative Procedures must guarantee human oversight.

Furthermore, before any deployment, institutions must conduct mandatory Data Protection Impact Assessments (DPIA). Finally, establishing innovation spaces such as AI Labs or regulatory sandboxes is highly advised to safely test emerging technologies before widespread rollouts while building the technical capacities of civil servants.

Regjimi Pasuror Martesor dhe dallimet midis pasurisë vetjake dhe bashkësisë ligjore në të drejtën shqiptare dhe kontrata e sipërmarrjes

Artan Manushaqe

Departamenti i Drejtësisë

Fakulteti i Ekonomise, Drejtesise dhe Shkencave Sociale, Kolegji Universitar i Biznesit

Abstrakt

Ky punim analizon regjimin pasuror martesor në të drejtën shqiptare, duke u fokusuar në dallimin midis pasurisë vetjake dhe pasurisë në bashkësi ligjore. Studimi trajton situatat juridike kur pasuritë e fituara para martesës zhvillohen ekonomikisht gjatë martesës përmes veprimeve kontraktore dhe administrimit aktiv. Qëllimi është të identifikohen kriteret juridike që përcaktojnë nëse rritja e vlerës së pasurisë mbetet vetjake apo përfshihet në bashkësinë ligjore. Metodologjia e përdorur është normative dhe analitike, duke u bazuar në dispozitat e Kodit të Familjes dhe doktrinën bashkëkohore. Gjetjet tregojnë se e drejta shqiptare aplikon një qasje të përzier midis pronësisë formale dhe kontributit ekonomik real të bashkëshortëve.

***Fjalë kyce**; Regjim pasuror martesor, pasuri vetjake, bashkësi ligjore, kontrata civile, administrim pasurie, e drejtë familjare.*

1. Hyrje

Regjimi pasuror martesor përbën një nga institutet më të rëndësishme të së drejtës familjare, pasi përcakton marrëdhëniet ekonomike midis bashkëshortëve gjatë dhe pas martesës. Në sistemin juridik shqiptar, në mungesë të një kontrate martesore, zbatohet regjimi i bashkësisë ligjore, i cili bazohet në prezumimin se pasuria e fituar gjatë martesës është e përbashkët.

Megjithatë, në praktikë lindin situata komplekse kur pasuria e fituar para martesës zhvillohet ekonomikisht gjatë martesës përmes kontratave, investimeve apo administrimit aktiv. Këto situata krijojnë paqartësi mbi kufirin midis pasurisë vetjake dhe asaj të bashkësisë, duke kërkuar interpretim të thelluar juridik.

Sipas Kodit të Familjes, pasuria vetjake përfshin pasuritë e fituara para martesës, trashëgimitë dhe dhurimet, si dhe pasuritë personale që nuk lidhen me ekonominë familjare. Ndërsa pasuria e bashkësisë përfshin të ardhurat dhe pasuritë e krijuara gjatë martesës.

Parimi bazë është se çdo pasuri e fituar gjatë martesës prezumohet e përbashkët, përveç nëse provohet e kundërta.

2. Problemi i pasurive të zhvilluara gjatë martesës.

Në praktikë, një pasuri e fituar para martesës mund të rrisë vlerën e saj gjatë martesës për shkak të, kontratave civile të lidhura gjatë martesës,administrimit aktiv ekonomik,investimeve ose zhvillimit të pasurisë.Në këto raste lind pyetja juridike: a mbetet kjo rritje pjesë e pasurisë vetjake apo bëhet pjesë e bashkësisë? Regjimi pasuror martesor në Shqipëri rregullohet nga dispozitat e Kodit të Familjes, i cili parashikon si regjim ligjor bashkësinë pasurore ndërmjet bashkëshortëve. Në mungesë të një kontrate të posaçme, zbatohet automatikisht ky regjim. Një

ndër parimet themelore është prezumimi i bashkësisë, sipas të cilit çdo pasuri e fituar gjatë martesës konsiderohet e përbashkët, derisa të provohet e kundërta. Ky parim përbën bazën e shumicës së konflikteve gjyqësore në këtë fushë.

Ligj i parashikon edhe kategorin të pasurisë vetjake, te cilat përjashtohen nga bashkësia, si pasuritë e fituara para martesës, pasuritë e fituara me trashëgimi ose dhurim, sende personale për përdorim personal dhe për për ushtrimin e profesionit, apo pasuritë e fituara si rezultat i tjetërsimit të pasurisë vetjake. Prona vetjake garantohet edhe nga KEDNJ[19].

3. "Kontrata e sipërmarrjes(porosisë) " dhe ndikimi i saj në regjimin pasuror martesor!

Kontrata e sipërmarrjes përfaqëson një instrument juridik të rëndësishëm në qarkullimin civil, veçanërisht në sektorin e ndërtimit. Nëpërmjet saj, një subjekt merr përsipër realizimin e një vepre kundrejt një shpërblimi ose përfitimi në natyrë.

Kur një pasuri e paluajtshme, që përbën pasuri vetjake të njërit bashkëshort, përfshihet në një kontratë sipërmarrjeje gjatë martesës, lind një problematikë thelbësore: a ndryshon karakteri juridik i kësaj pasurie apo i përfitimeve që rrjedhin prej saj? Nga analiza ligjore rezulton se, vetë pasuria bazë ruan karakterin e saj vetjak, ndërsa përfitimet ekonomike të krijuara gjatë martesës mund të konsiderohen pjesë e bashkësisë, nëse plotësohen kushtet ligjore.

Bashkësia (pasuria e bashkëshortëve y dhe x) përbëhet nga:

a) Pasuria e fituar nga të dy bashkëshortët, së bashku ose veç e veç, gjatë martesës;
b) Të ardhurat nga veprimtaria e veçantë e çdo bashkëshorti gjatë martesës, nëse nuk janë konsumuar deri në mbarimin e bashkëpronësisë;

c) Frytet e pasurisë së çdo bashkëshorti, që janë marrë dhe nuk janë konsumuar deri në mbarimin e bashkëpronësisë; veprimtaria tregtare e krijuar gjatë martesës.

Në rast se veprimtaria tregtare para lidhjes së martesës i përkiste vetëm njërit bashkëshort, por gjatë martesës drejtohet nga të dy bashkëshortët, bashkësia përfshin vetëm fitimet dhe shtimin e prodhimit. Pra, nëse "y" ka një pasuri dhe pronë të ardhur para martesës, ajo quhet pasuri vetjake dhe nuk bën pjesë në Bashkësinë e Regjimit Martesor.

"Konflikti dhe Procesi Gjyqësor për bashkëpronësinë dhe kontratën e sipërmarrjes... nëse do të kishte"!

Çfarë do të kërkoja unë në gjykatë nëse procesi do të shkonte drejt asaj rruge. Do të kërkoja në radhë të parë vërtetimin e origjinës së pronës? A është ajo vetjake? Më pas procedurën për vërtetimin e regjimit pronësor martesor (pra, kush e ka pasur këtë pronë, kush e ka poseduar, kush e ka disponuar, kush e ka gëzuar këtë pasuri, kush ka paguar dritat dhe ujin, kush i ka librezat dhe faturat dhe në emër të kujt janë "faturat), apo taksa dhe dokumente të tjera që vërtetojnë se kjo pasuri ka ardhur si pasojë jo e regjimit pasuror martesor, por si pasojë e pronësisë vetjake.Më pas kalojmë në fazën tjetër, atë të kundërshtimit të palëve të kontratës së sipërmarrjes lidhur me kuotën tjetër të 50% të drejtave pasurore të bashkëshortëve për të vërtetuar faktin se kjo pasuri/pronë nuk vjen nga regjimi martesor dhe subjekti nuk ka qenë dhe nuk mund të jetë pronare.Pasuria e krijuar gjatë martesës, e caktuar për administrimin e veprimtarisë tregtare te njërit prej bashkëshortëve, dhe shtesat e prodhimit të saj janë objekt i bashkëpronësisë vetëm nëse ekzistojnë si të tilla në çastin e mbarimit të martesës.

Pasuria e bashkëshortëve prezumohet si e përbashkët, me përjashtim të rastit kur bashkëshorti provon karakterin e saj vetjak. Në rastin konkret kuptojmë që, nesër, me përfundimin e objektit

[19] https://fra.europa.eu/en/law-reference/1st-additional-protocol-european-convention-human-rights-echr-0

njëri bashkëshort futet në posedim të sendit dhe e jep me qira, qofshin këto ambiente tregëtare, banimi apo përdorimi dhe nëse pala tjetër ka pretendime, ajo mund ti drejtohet gjykatës.

Pasuria vetjake

Pasuri vetjake e bashkëshortit që nuk bën pjesë në bashkësi është:

a) Pasuria që, para lidhjes së martesës, ishte në bashkëpronësi të bashkëshortit me persona të tjerë ose kundrejt së cilës ai ishte titullar i një të drejte reale përdorimi

b) Pasuria e fituar gjatë martesës me anë të dhurimit, të trashëgimisë ose lekut, kur në aktin e dhurimit ose në testament nuk përcaktohet se ato janë dhënë në favor të bashkësisë,

c) Pasuritë e përdorimit ngushtësisht vetjak të secilit bashkëshort dhe pasuritë e fituara si aksesore të pasurisë vetjake,

ç) Mjetet e nevojshme të punës për ushtrimin e profesionit të njërit prej bashkëshortëve, përveç atyre që janë caktuar për administrimin e një veprimtarie tregtare,

d) Pasuria e fituar nga shpërblimi i dëmëve vetjake, me përjashtim të të ardhurave që rrjedhin nga pensioni i fituar për shkak të humbjes së pjesshme ose të plotë të aftësisë për punë,

dh) Pasuria e fituar nga tjetërsimi i pasurive vetjake të sipërpërmendura;

e) Shkëmbimi i tyre, kur kjo është deklaruar shprehimisht në aktin e blerjes.

Bashkësia mund të përfitojë kompensim, pas mbarimit të saj, për të ardhurat dhe pasuritë që bashkëshorti ka neglizhuar të marrë ose për ato që ai ka shpenzuar në keqbesim. Kërkesa për kompensim duhet të paraqitet nga bashkëshorti i interesuar para mbarimit të procedurës së ndarjes së pasurisë. Pasuria e fituar në shkëmbim të një pasurie, e cila i përkiste individualisht njërit prej bashkëshortëve, është pasuri vetjake, me përjashtim të kompensimit që i bëhet bashkësisë, ose e kundërta, kur nga shkëmbimi rezulton të jetë diferenca. Nëse diferenca në ngarkim të bashkësisë është më e madhe se vlera e pasurisë vetjake të tjetërsuar, pasuria e fituar në këtë shkëmbim i përket bashkësisë, përveç kompensimit në favor të pasurisë vetjake të bashkëshortit. Të ardhurat e përfituara, si pasojë e një ankandi ose forme tjetër, të një pasurie të paluajtshme ku njeri nga bashkëshortët është bashkëpronar në pjesë të pandara, nuk përbëjnë pasuri të fituar gjatë martesës, me përjashtim të kompensimit që duhet t'i bëhet bashkësisë për shpenzimin që ajo ka bërë.

Bashkëshortët përgjigjen mbi pasurinë në bashkësi deri në gjysmën e vlerës së saj (dmth. y 50%, x 50%) kundrejt kreditorëve vetjakë të çdo bashkëshorti, kur pasuria vetjake e tij nuk mjafton për përmbushjen e detyrimit.

a) Bashkëshortët përgjigjen detyrimeve që ai ka marrë përsipër vetëm për administrimin e pasurisë në bashkësi, jashtë kufijve të tagrave të tij të administrimit.

b) Bashkëshortët përgjigjen detyrimeve të tij vetjake, cilido qofte çasti i lindjes së tyre.

Paragrafi i mësipërm nuk zbatohet nëse ka pasur mashtrim nga bashkëshorti debitor dhe keqbesim nga kreditori. Në rast se detyrimi vetjak i njërit bashkëshort është shlyer nga bashkësia, ai detyrohet të bëjë kompensimin e bashkësisë. Të ardhurat vetjake të një bashkëshorti nuk mund të preken nga kreditorët e bashkëshortit tjetër, vetëm nëse detyrimi ka qenë i kontraktuar për mirëmbajtjen e banesës dhe të familjes. Ky është korrigjimi për pjesën që trajton pasurinë vetjake, detyrimet dhe kompensimet.

Në rastin kur detyrimi është kontraktuar në interesin vetjak të njërit prej bashkëshortëve dhe ai është shlyer nga pasuria në bashkësi, bashkëshorti përfitues detyrohet të bëjë kompensimin e

bashkësisë. (Bashkëpronësia mes bashkëshortëve rregullohet me dispozitat e Kodit të Familjes)[20]. Në rast se nga pasuria në bashkësi janë paguar gjoba ose dëmshpërblime, për të cilat është detyruar njeri prej bashkëshortëve për shkak të një dënimi penal ose administrativ, ai detyrohet të kompensojë pasurinë në bashkësi.

Bashkësia ka të drejtën për kompensim nëse detyrimi që bashkësia ka shlyer ishte kontraktuar nga njeri prej bashkëshortëve në kundërshtim me detyrimet që i imponon martesa. Kur një detyrim vjen në bashkësi për shkak të njërit bashkëshort, ai nuk mund të kërkohet mbi pasuritë vetjake të bashkëshortit tjetër. Nëse ka detyrime solidare të të dy bashkëshortëve, ai mund të kërkohet mbi pasurinë në bashkësi.Në rast konflikti lidhur me pasurinë , në kushtet kur mund të diskutoni regjimin pasuror martesor e atë me kontratë, rruga më e mirë dhe efikase do të ishte pa shkuar në gjykatë, pasi procesi do të zgjaste shumë (në Shqipëri).

Administrimi i bashkësisë!

Secili bashkëshort ka të drejtën e administrimit të zakonshëm të pasurisë në bashkësi. Secili bashkëshort është përfaqësues ligjor edhe i bashkëshortit tjetër përpara organeve administrative dhe gjyqësore për çështje që kanë të bëjnë me administrimin e zakonshëm të pasurisë në bashkësi.

Kryerja e veprimeve që kapërcejnë administrimin e zakonshëm u takon bashkërisht të dy bashkëshortëve. Në rast largësie ose pengese tjetër të njërit bashkëshort dhe në mungesë të prokurës ose autorizimit të gjykatës, bashkëshorti tjetër mund të kryejë veprimet që janë të nevojshme edhe në rastin kur kërkohet pëlqimi i të dy bashkëshortëve, sipas nenit 90 të këtij Kodi.Pra, nëse jetoni në Itali prej më shumë se 30 vjetësh, bazuar në nenin 90[21] të Kodit të Familjes njëri bashkëshort, ka mundësi të administrojë pasurinë në Tiranë, e ta japi me qira apo ta përdorni si më sipër, por jo për tjetërsim të saj.Nëse njeri prej bashkëshortëve (bashkëshortja) refuzon të japë pëlqimin për kryerjen e një veprimi të administrimit të jashtëzakonshëm ose për veprime të tjera për të cilat kërkohet pëlqimi, bashkëshorti tjetër mund t'i drejtohet gjykatës për të marrë autorizimin me padi[22]. Gjykata mbas legjitimmit të palës, vendos dhënien e autorizimit kur kryerja e veprimit është e nevojshme për interesa të familjes ose të veprimtarisë tregtare që bën pjesë në bashkësi. P.sh., nëse keni dhënë më qera një apartament në bashkëpronësi ku 50% e keni ju dhe 50% bashkëshortja, kjo e fundit, nëse ka pretendime bazuar në nenin 91[23] të Kodit të Familjes, i drejtohet gjykatës. Nëse njeri nga bashkëshortët, për një kohë të vazhdueshme, ndodhet jashtë gjendjes për të shprehur vullnetin e tij, ose nëse administrimi i bashkësisë nga ana e tij dëshmon paaftësi ose keqbesim, bashkëshorti tjetër mund t'i kërkojë gjykatës të zëvendësojë atë në ushtrimin e të drejtave të tij. Bashkëshorti i privuar nga të drejtat e administrimit të bashkësisë mund ti kërkojë gjykatës rikthimin e tyre, nëse provon se janë zhdukur shkaqet e përjashtimit të tij nga administrimi.Bashkëshortët mund të bien dakort që të administrojnë së bashku

bashkësinë. Në këtë rast, aktet e administrimit të zakonshëm dhe të disponimit të pasurisë bëhen me nënshkrimin e përbashkët të të dy bashkëshortëve[24]. Nëse njeri nga bashkëshortët tejkalon të drejtat e tij mbi pasurinë në bashkësi, mund të kërkohet nga bashkëshorti tjetër anulimi i veprimit, nëse më vonë ai nuk ka dhënë pëlqimin për këtë veprim. Kjo padi mund të ngrihet brenda 1 viti nga data e marrjes dijeni për veprimin dhe, në çdo rast, jo më vonë se 1 vit nga mbarimi i bashkësisë (mbarim i bashkësisë nënkupton pjesëtimin e pasurisë mes bashkëshortëve, si në rruge vullnetare apo në gjyqësore).Secili bashkëshort ka të drejtë të administrojë dhe të disponojë lirisht pasuritë vetjake. Nëse gjatë martesës njeri nga

[20] Kondili. V, E Drejta Civile II,Pjesa e Posacme, fq 193
[21] Mandro, H. (2009). E drejta familjare, Tiranë. Fq 238
[22] Kodi Procedurës Civile Neni 153, Gjykimi i një çështjeje në gjykatë fillon me paraqitjen e kërkesëpadisë me shkrim.
[23] Kodi Familjes Neni 91
[24] Qarri, E.Doktoratrë (2014), fq 147

bashkëshortët i beson tjetrit administrimin e pasurisë së tij vetjake, zbatohen rregullat e përfaqësimit.
Nëse njeri nga bashkëshortët administron pasurinë vetjake të tjetrit, me dijeninë e këtij të fundit dhe pa pasur kundërshtim nga ana e tij, konsiderohet se ka marrë një akt përfaqësimi në heshtje, që mbulon veprimet e administrimit dhe të përdorimit, me përjashtim të tagrit të disponimit[25]. Ai përgjigjet kundrejt bashkëshortit tjetër me cilësinë e përfaqësuesit dhe, nëse është rasti, detyrohet të dorëzojë vetëm frytet që ekzistojnë, duke mos u përgjigjur për ato që janë konsumuar. Nëse njeri nga bashkëshortët, me gjithë kundërshtimin e tjetrit, administron pasurinë e tij vetjake dhe kryen veprime lidhur me të, përgjigjet për dëmin e shkaktuar dhe për frytet që duhet të ishin marrë. Bashkëshorti i dëmtuar ka të drejtë të ngrejë padi për anulimin e veprimit të kryer, sipas kritereve të përcaktuara në nenin 93[26]-94[27] të kodit të familjes.Mbarimi i bashkësisë së regjimit pronësor martesor.

a) Me vdekjen e njërit prej bashkëshortëve, shpalljen i zhdukur ose i vdekur të njërit prej tyre, shpalljen të pavlefshme dhe zgjidhjen e martesës.

b)Me pjesëtimin e pasurive.

c) Me ndryshimin e regjimit pasuror martesor, kur sjell mbarimin e bashkësisë si shprehje e lirisë së vullnetit të palëve të e garantuara nga neni 11/3 dhe 18/1 i [28].

Pjesëtimi i pasurisë mes bashkëshortëve!

Pjesëtimi i pasurisë në bashkësi mund të kërkohet në gjykatë në rast paaftësie dhe administrimi të keq të njërit prej bashkëshortëve, kur mënyra e administrimit të pasurisë prej tij vë në rrezik interesat e bashkëshortit tjetër ose të familjes, ose kur njeri nga bashkëshortët nuk kontribuon për nevojat e familjes në proporcion me gjendjen e tij dhe aftësinë për punë, dhe kur ka ndodhur një pjesëtim faktik i pasurisë në bashkësi.

Ndarja e pasurisë mund të kërkohet nga njeri prej bashkëshortëve ose nga përfaqësuesi i tij ligjor. Kreditoret e njërit bashkëshort nuk mund të kërkojnë vetë ndarjen e pasurisë.Kërkesa dhe vendimi i ndarjes së pasurisë duhet të depozitohen pranë zyrës së gjendjes civile dhe, nëse është rasti, edhe në regjistrin tregtar. Vendimi shënohet në regjistrin e gjendjes civile, si dhe në origjinalin e kontratës së martesës.

Secili nga bashkëshortët duhet të kompensojë shumat e marra nga pasuria në bashkësi, që janë përdorur për qëllime të ndryshme nga ato të përmbushjes së detyrimeve të parashikuara në nenin 81[29] të këtij Kodi.

Kompensimet dhe kthimet realizohen në çastin e mbarimit të bashkësisë. Gjykata mund të autorizojë dhe të urdhërojë për ato në çdo çast nëse e kërkon dhe e lejon interesi i familjes. Pjesëtimi i pasurisë në bashkësinë ligjore bëhet duke u nisur nga barazia e aktivit dhe pasivit të saj.

Pasi të jenë zbritur nga bashkësia detyrimet që ajo ka ndaj bashkëshortëve ose të tretëve, pasuria që mbetet ndahet në pjesë të barabarta midis bashkëshortëve. Gjykata, në bazë të

[25] Neni 118, Kodi i Familjes, Nëse njeri nga bashkëshortët administron pasurinë e bashkëshortit tjetër, me dijeninë e këtijte fundit dhe pa pasur kundërshtim nga ana e tij, konsiderohet se ka marre një mandat te heshtur, i cili mbulon veprimet lidhur me administrimin, por jo ato te disponimit.
[26] Neni 93, Kodi i Familjes "Nëse njëri nga bashkëshortët, për një kohë të vazhdueshme, ndodhet jashtë gjendjes për të shprehur vullnetin e tij, ose nëse administrimi i bashkësisë nga ana e tij dëshmon për paaftësi ose keqbesim, bashkëshorti tjetër mund t'i kërkojë gjykatës të zëvendësojë atë në ushtrimin e të drejtave të tij. Bashkëshorti i privuar nga të drejtat e administrimit të bashkësisë mund t'i kërojë gjykatës rikthimin e tyre, nëse provon se janë zhdukur shkaqet e përjashtimit të tij nga administrimi."
[27] Mando, H. (2009). E drejta familjare, Tiranë. Fq 237
[28] Neni 11/3 dhe 18/1 i Kushtetutës
[29] Kodi Familjes Neni 81

nevojave të fëmijëve dhe nga fakti se kujt do t'i besohen ata, mund të vendosë në favor të një bashkëshorti kalimin e një pjese të pasurisë së bashkësisë që i takon bashkëshortit tjetër.

Kur kompensimi bëhet në dobi të njërit bashkëshort, ky i fundit merr nga pasuria e bashkësisë një shumë të barabartë me vlerën që bashkësia i detyrohet atij. Nëse aktivi i pasurisë së bashkësisë është i pamjaftueshëm, bashkëshorti tjetër është i detyruar për diferencën. Në rastet kur aktivi i pasurisë nuk është i mjaftueshëm për të përmbushur detyrimet e bashkësisë ndaj të tretëve, kreditoret kanë të drejtë t'i drejtohen secilit prej bashkëshortëve, të cilët përgjigjen solidarisht. Bashkëshorti që ka shlyer detyrimin e bashkësisë ka të drejtën e regresit ndaj bashkëshortit tjetër për pjesën e detyrimit të shlyer për llogari të tij. Në fillim të procedurës së pjesëtimit të pasurisë në bashkësi, bashkëshortët ose trashëgimtarët e tyre kanë të drejtë të marrin pasurinë e luajtshme vetjake, që u përkiste para bashkësisë ose që ata e kanë fituar gjatë bashkësisë në formë trashëgimie ose dhurimi (përshembull vetura, apo një send për përdorimt personal që e ke pasur në emrin tënd). Në mungesë të provave të kundërta, prezumohet se pasuria e luajtshme bën pjesë në bashkësi. Nëse pasuria e luajtshme nuk ekziston në natyrë, bashkëshorti dhe trashëgimtarët e tij kanë të drejtë të marrin vlerën e saj duke zbritur amortizimin nga përdorimi në bashkësi, me kusht që mungesa e pasurisë të ketë ardhur për shkak të konsumit për përdorim, shkatërrimit ose humbjes së saj, ose për çdo shkak që nuk mund t'i kundërvihet bashkëshortit tjetër.

4. Gjetje dhe Rekomandime.

Verifikimi i origjinës së pasurisë mbetet elementi kryesor në përcaktimin e karakterit të saj,

Kontratat e lidhura gjatë martesës mund të ndikojnë në shpërndarjen e përfitimeve, por jo domosdoshmërisht në ndryshimin e pronësisë,

Roli i gjykatës është vendimtar në interpretimin dhe zgjidhjen e drejtë të këtyre marrëdhënieve,

Përcaktimi i regjimit pasuror martesor me kontrate do të ishte një zgjidhje e mirë paraprake e cila do të parandalonte konfliktet që mund të lindnin,

Rruga më efikase për zgjidhjen e këtyre konflikteve do të ishte nëpërmjet ndërmjetësimit dhe negocimit pa vajtur në gjykatë.

Kalimi në informacionin numerik – një hap madhështor i njerëzimit në gjithë historinë e tij

Petrit Demiraj

Departamenti i Studimeve të Larta Teknike, KSLP, KUB, Shqipëri

E-mail: pdemiraj@kub.edu.al

Abstrakt

Kalimi nga informacioni analog në atë numerik shënon një hap madhështor që përcaktoi një progres të paimagjinueshëm në gjithë aktivitetin njerëzor. U shënuan rritje shumë përmasëshe jo vetëm në teknologjinë e komunikimit, por në gjithë jetën shoqërore, në ekonomi, industri, arsim, art, kulturë, në mënyrën e jetesës, në mënyrën e të menduarit dhe konceptet e avancuara në udhën e zhvillimit dhe gjithë perspektivës njerëzore.

Possibilities for reducing the digital footprint of the most popular government institutions and media websites: a comparative analysis of the cases of Lithuania and Albania

Dr. Jūratė Ignatavičiūtė[1], Gerda Ivanickienė[2]

[1,2]*Utena Higher Education Institution*

Abstract

The study examines the possibilities of reducing the digital footprint of a website, which are particularly relevant from the perspective of sustainable software engineering. The rapidly growing pace of digitalization and the development of Internet services force more and more users to use the services they need online, but those who implement the services usually do not devote too much time to assessing the energy efficiency of the website and its impact on the environment. The purpose of this study is to analyze the digital footprint of the most popular government and media Lithuanian and Albanian websites from an engineering point of view and to identify opportunities for reducing their digital footprint. The article discusses the main indicators of the digital footprint of a website and the means to measure them, presents the results of the measurements of the digital footprint indicators of the most popular Lithuanian and Albanian websites in different sectors, and formulates recommendations based on them, creating the prerequisites for reducing the digital footprint of a website and contributing to the development of a more sustainable digital society.

Research methods used: analysis of scientific literature and internet sources, evaluation of measurement indicators, comparative analysis, generalization.

The study found that digital footprint of a website is a complex indicator determined by the weight of the website, the volume of data transfer, the website architecture and the infrastructure. Therefore, only overall assessment of these individual indicators allows us to determine the environmental impact of a website and identify optimization priorities.

Keywords*: website digital footprint, digital footprint reduction, sustainable software, digital footprint assessment indicators*

JEL code: O33

1. Introduction

The rapid growth of digitalization and the development of online services have created a misconception that digital space has no direct impact on the environment. However, studies show that the information and communication technology (ICT) sector generates between 2.1% and 3.9% of all global greenhouse gas emissions (Freitag et al., 2021). From an engineering point of view, the energy efficiency of a website directly depends on its software architecture: the amount of data transmitted, the number of requests and the complexity of calculations performed on the client side (Rani et al., 2024). While sustainable software engineering is becoming a standard in Western Europe, established by initiatives such as the Green Software Foundation (Green Software Foundation, 2023), in Lithuania, user interface solutions and search engine optimization indicators are still prioritized. This trend is confirmed by national regulations (Informacinės visuomenės plėtros komitetas, 2023), which specify in detail the technical requirements for information accessibility and compatibility with various devices, but do not discuss energy efficiency criteria or optimization of data transfer flows from an ecological perspective. Albania's national documents also emphasize the development of a sustainable

digital space (National Plan for Sustainable Development of Digital Infrastructure, 2020-2025). The plan outlines the development of digital infrastructure and broadband capacity, which is essential for sustainable software adoption. As can be seen, various initiatives and standards point towards sustainable engineering development, but there is a lack of research-based website optimization strategies.

This article aims to analyze the digital footprint of the most popular government and media Lithuanian and Albanian websites from an engineering point of view and to identify opportunities for reducing their digital footprint.

Tasks:

1. To discuss indicators for evaluating a website's digital footprint.

2. To measure and compare the digital footprint indicators of the most popular Lithuanian and Albanian media and government websites and identify engineering optimization opportunities.

3. To formulate general recommendations for reducing the digital footprint of a website.

The most visited websites in Lithuania and Albania from different sectors – media and government institutions – were selected for the study. These sectors were chosen because the majority of the population in the countries is forced to use these services, even if digital solutions are not always the most sustainable. The evaluation is carried out using publicly available and free tools. The study is limited to the analysis of the home page, as it generates the largest data flow (HTTP Archive, 2025).

The following research methods were applied in preparing the article: analysis of scientific literature and Internet sources, evaluation of measurement indicators, comparative analysis, and generalization.

2. Key indicators for evaluation of the digital footprint.

Sustainable software engineering is defined as the discipline of designing, developing, and operating software that aims to minimize its carbon dioxide (CO_2) emissions and energy consumption (Arnia, 2025), but it is also important that efficiency is not compromised.

The evaluation of the digital footprint starts with the weight of the page (MB), which directly determines the volume of data transfer and energy consumption. CO_2 emissions are considered a key indicator of sustainability performance. The number of HTTP requests reflects the efficiency of the network, as each request increases the load on the server and the client (Arnia, 2025). Server energy measures the consumption of server-side resources, while the number of elements in the hierarchical structure of the page elements (hereinafter referred to as the DOM) measures the complexity of client processing, both of which contribute to the overall digital footprint of a website (Contino, 2024).

According to the HTTP Archive Web Almanac 2024, data transfer and requests account for the majority of the page weight, which determines energy consumption and CO_2 emissions (HTTP Archive, 2024). These parameters, together with server and DOM load, dominate emissions according to the Green Software Foundation standards (Arnia, 2025; Contino, 2024). Therefore, they account for up to 80% of a website's emissions and are a priority for optimization (Arnia, 2025; Contino, 2024; HTTP Archive, 2024).

The main indicators that will be measured to evaluate the digital footprint are: page weight (MB), CO_2 emissions (g), number of HTTP requests, server energy, and number of DOM elements. These indicators cover both server-side and client-side impacts and allow for an accurate evaluation of the website's digital footprint and prioritization of optimization.

Recommended values for the indicators are given in Table 1.

Table 1. Values of indicators for evaluating the digital footprint of websites

Measured indicator	Recommended limit
Page weight (MB)	< 2-3 MB (HTTP Archive, 2024)
Number of HTTP requests	< 50 (HTTP Archive, 2024)
Number of DOM elements	< 800 (recommended), < 1500 (critical limit) (web.dev, 2023)
CO_2emissions (g)	< 1 g during first page load (EcoFriendlyWeb, 2023)

3. Selection of tools for evaluation of the digital footprint

Publicly available and free analysis tools were selected for the evaluation of the digital footprint, allowing for an objective evaluation of the main technical and environmental indicators of the website: page weight, CO_2 emissions, number of HTTP requests, server energy consumption, and number of DOM elements. Although these tools provide generalized evaluation, their functionality is sufficient to conduct comparative analysis and formulate reasonable conclusions about the digital footprint of websites. The tools for evaluation of the digital footprint of a website are listed in Table 2.

Table 2. Tools for evaluation of the digital footprint of websites

Measured Indicator	Why is the measured indicator important?	Selected Tool
Page weight (MB)	This indicator allows you to evaluate the total volume of data transfer and the resources used by the website (HTTP Archive, 2025)	Pingdom Tools
CO_2emission (g)	Indicator for evaluating compliance with sustainability standards (Green Software Foundation, 2023-2025)	Digital Beacon
Number of HTTP requests	Indicates the complexity of the architecture and network load. A high number of HTTP requests increases network load and latency(HTTP Archive, 2025)	Pingdom Tools
Server power	Determines whether the website hosting uses "green" energy. (Green Web Foundation, 2024), i.e. determines whether energy generated from renewable energy sources is used.	Green Web Foundation
Number of DOM elements	A measure of client-side processor load; a high number increases the power consumption of the user's device. (Google, PageSpeed Insights documentation, 2024)	PageSpeed Insights

All measurements were performed using the same device to avoid device differences affecting the results.

4. Evaluation of the digital footprint of the most popular Lithuanian and Albanian websites

The most visited Lithuanian and Albanian websites from the media and government institutions sectors were selected for the study. The platforms Semrush and SCImago Media Rankings, which record such statistical data, were used to determine the popularity of website traffic.

When selecting the websites of government institutions, data from the international market analytics platform Semrush was used, which allows evaluating the popularity of state institution websites on a global scale. According to this tool's report, the most visited websites of Lithuanian government institutions are lrt.lt, epaslaugos.lt, vmi.lt, sodra.lt, meteo.lt, lrv.lt, uzt.lt, kasvyksta.lt, stops.lt, eso.lt (Semrush, Lithuania, March 2026) and the most visited websites of Albanian government institutions are tatime.gov.al, e-albania.al, shqiptarja.com, rks-gov.net, europa.eu, app.gov.al, kosovajob.com, atk-ks.org, fsdksh.gov.al, bilanc.com (Semrush, Albania, March 2026). The study included the most popular Lithuanian media websites lrt.lt, 15min.lt, tv3.lt, kauno.diena.lt, lrytas.lt, respublika.lt, europeanhitradio.lt, relaxfm.lt, rc.lt, ziniuradijas.lt, which occupy leading positions in terms of the average number of daily real users according to the SCImago Media Rankings platform data (SCImago Media Rankings, Lithuania, March 2025). The same SCImago Media Rankings platform was used for selecting most popular Albanian media websites – panorama.com.al, balkanweb.com, kohajone.com, top-channel.tv, noa.al, gazetashqiptare.al, shekulli.com.al, rtsh.al, abcnews.al, oranews.tv (SCImago Media Rankings, Lithuania, March 2025). Note: botasoft.info, found in 4th place, was removed from the study because it failed to obtain results after repeated measurements.

The digital footprint indicators of the most popular websites in Lithuania and Albania in different sectors selected for the study are evaluated using the tools specified in Table 2. Measurements are performed on the same personal computer using the Google Chrome web browser. The research used statistical data from platforms reporting popularity results for April 2026. The results of the measurements are presented in Table 3 and Table 4 (websites in individual sectors are presented in descending order of popularity recorded during the study; measurement values marked in **red** indicate that the permissible values of the indicators have been exceeded, while those marked in **orange** indicate that they have exceeded the permissible norm but have not yet exceeded the critical limits).

The analysis revealed differences in CO_2 emissions between different sectors of Lithuanian websites. According to the results (Figure 1), the largest digital footprint is generated by media websites, which emit an average of 3.29 g of CO_2 per visit and this exceeds the permissible limit by more than 3 times. Meanwhile, the average CO_2 emission of Lithuanian government institutions websites is even lower than the recommended limit - 0.76 g. In the case of Albania, both the media and government institutions' websites generate on average two and a half to

three times the recommended CO_2 emissions - government websites generate an average of 2.45 CO_2 emissions, while media websites generate an average of 2.94 CO_2 emissions.

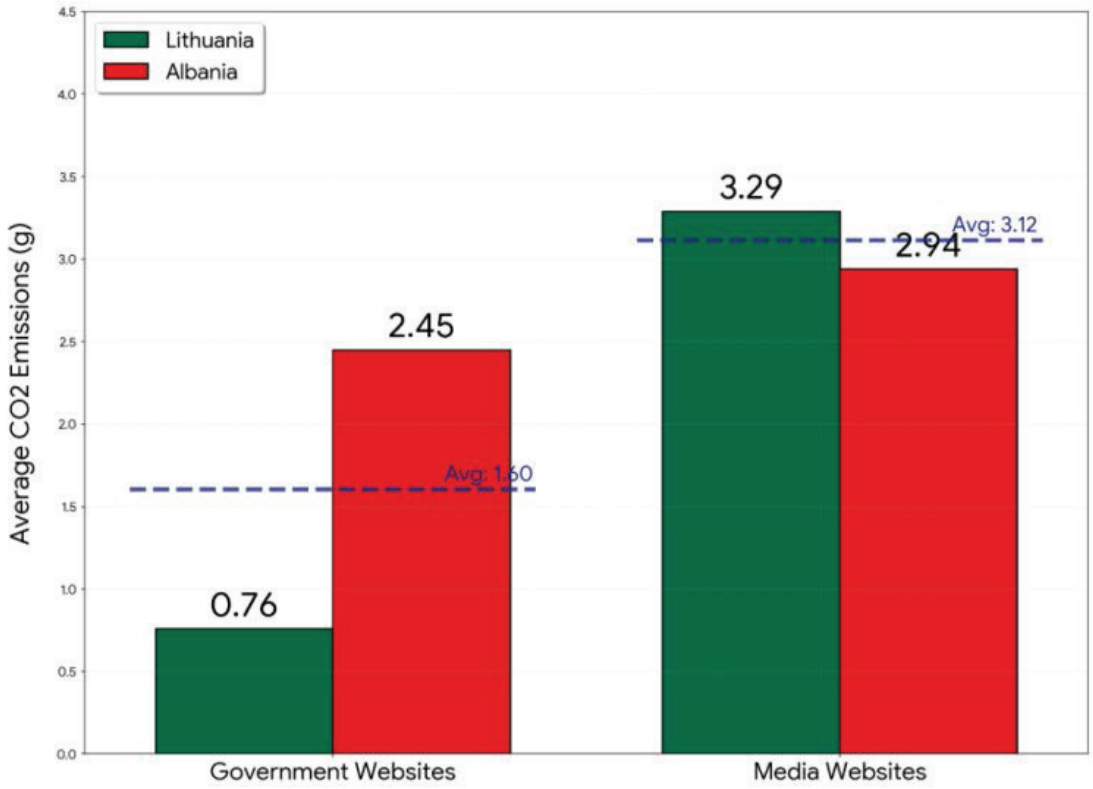

Figure 1. Comparison of average CO_2 emissions per visit by sector and country

The analyzed Lithuanian media websites also differ from others in the larger number of DOM elements (Figure 2), which indicates a potentially higher client-side load. A large number of DOM elements is associated with poorer website performance, according to web.dev, the complexity of the website structure is already increased if it has about 800 DOM elements, and more than 1400–1500 elements is considered a critical threshold that can significantly affect the functionality of the page (web.dev, 2023). Both countries' media websites are also distinguished by a larger number of HTTP requests, which directly affect the loading and performance speed of the website. Although on average websites generate about 185 HTTP requests, in order to avoid performance problems, optimization standards recommend not exceeding 50 (HTTP Archive, 2024). The number of DOM elements and the number of HTTP requests on the websites of government institutions in both countries do not deviate far from the recommended norms. The clear uniqueness of only one Albanian government institution (shqiptarja.com - 948 HTTP requests) is visible. However, as can be seen in Figure 2. There is no strong correlation between HTTP requests and the number of DOM elements, which indicates that the complexity of the website structure and network load depend on different optimization solutions and must be evaluated separately.

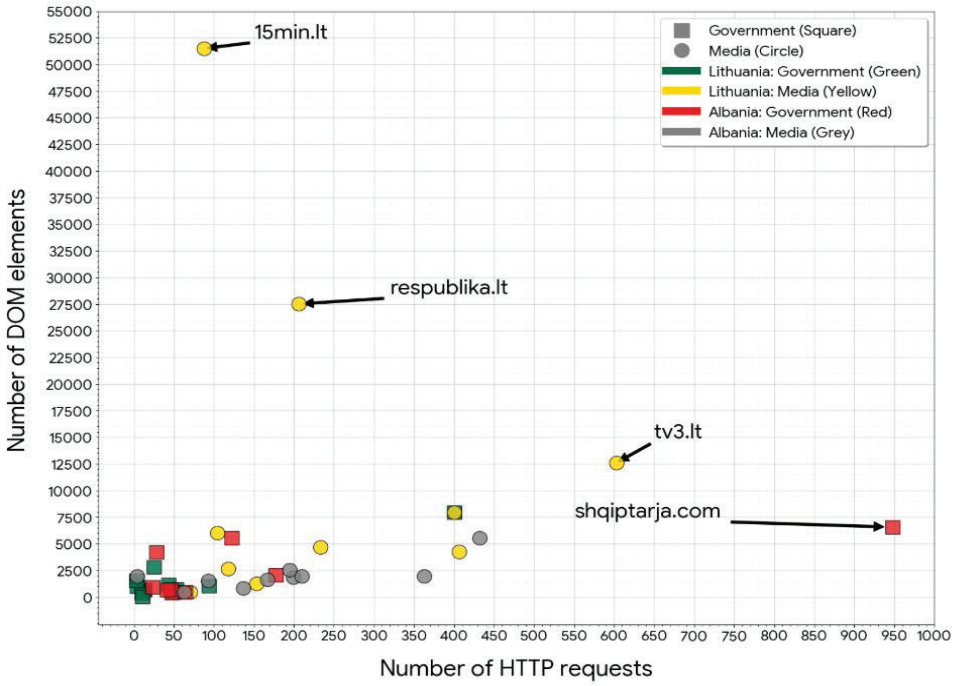

Figure 2. Diagram of the relationship between the number of HTTP requests and the number of DOM elements

Different structural solutions can also be seen in the analyzed Lithuanian media websites, for example, tv3.lt stands out with a very high number of HTTP requests (603), but a relatively lower number of DOM elements (12604), which indicates intensive use of external resources. Respublika.lt has a higher number of DOM elements (27512), but a relatively low number of requests (206), which indicates a different type of structural complexity. The 15min.lt website is the most prominent anomaly in the study, with an extreme number of DOM elements (51,508). The paradoxically low HTTP requests (88) indicate that a huge amount of content is embedded directly into the document code, rather than loaded from outside. This results in a high CPU load on the user's device, despite the average data traffic. Among Albanian websites, the government institutions website Shqiptarja.com stands out the most. It has an exceptionally high number of HTTP requests (948) but a rather average number of DOM elements (6563), indicating structural complexity driven by heavy loading of external resources rather than internal code depth.

There is a significant difference in the use of green energy on websites in Lithuania and Albania (Figure 3). Lithuanian government websites have the highest level of green energy – 80% of them use renewable energy sources. Lithuanian media websites do even better – 90% of them run on green energy, while only 10% still use conventional energy sources. In contrast, Albanian government websites show a significantly lower level of green energy deployment – only 30% of them use renewable energy sources, while 70% still rely on conventional energy. Since the use of renewable energy sources allows for greater environmental sustainability, the goal is to have as many government websites (which users are forced to use) as possible hosted on servers that use green energy. However, the situation is improving significantly in the Albanian media sector - all 100% of media websites use green energy, even overtaking Lithuania. These data show that while Lithuania leads the way in the government sector, the Albanian media has achieved a full green energy transition.

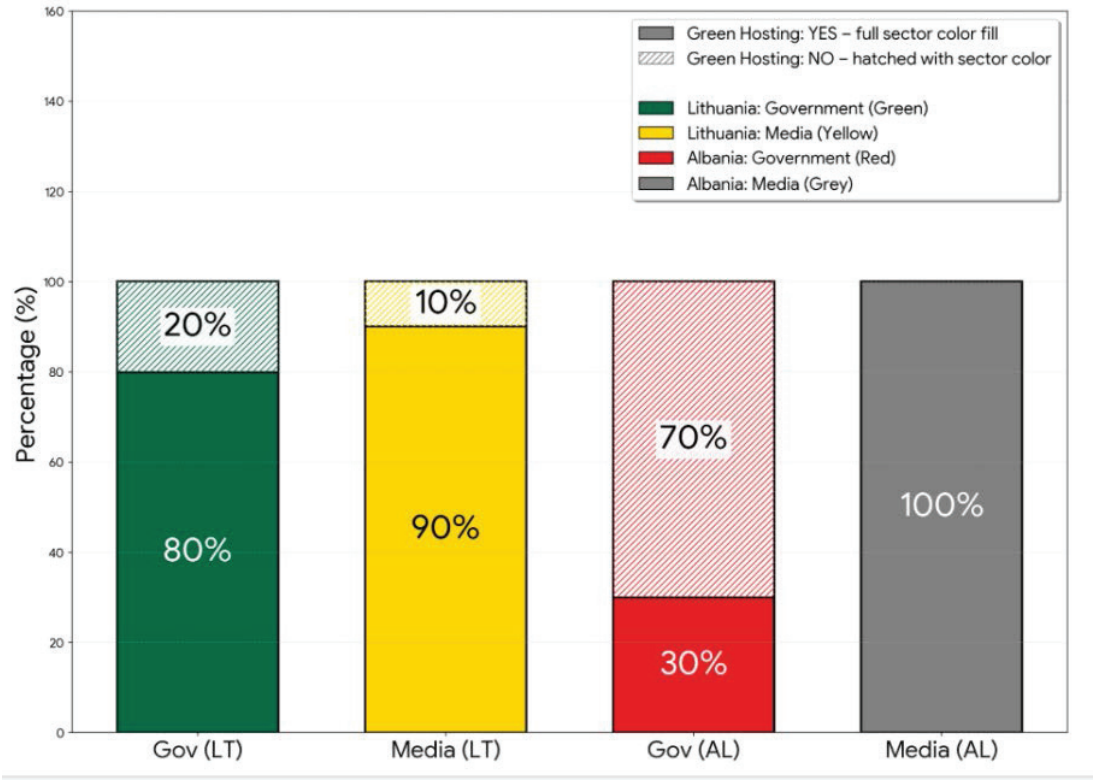

Figure 3. Diagram of green energy usage

Most often, a higher page weight also means a higher CO_2 emission (Figure 4). When comparing government sectors, Lithuania has a more even and stable result - most sites are lightweight, with low CO_2 emissions and more often combine this with the use of green energy. In Albania, the overall level is similar, but the sector is less consistent. While many sites are efficient, one (shqiptarja.com) particularly "heavy" and less sustainable case significantly distorts the overall picture.

Comparing the media sectors, Lithuania shows a great diversity - there are both fairly optimized websites and very "heavy" ones (e.g. over 50 MB), which significantly increase CO_2 emissions. However, most of them use green energy, so even larger pages are not as polluting as they could be. Albanian media websites are generally larger on average (average page weight ~11 MB) and their CO_2 emissions tend to be higher, although almost all of them use green energy. This shows that the main problem here is not the energy source, but the inefficiency of the content and technical solutions.

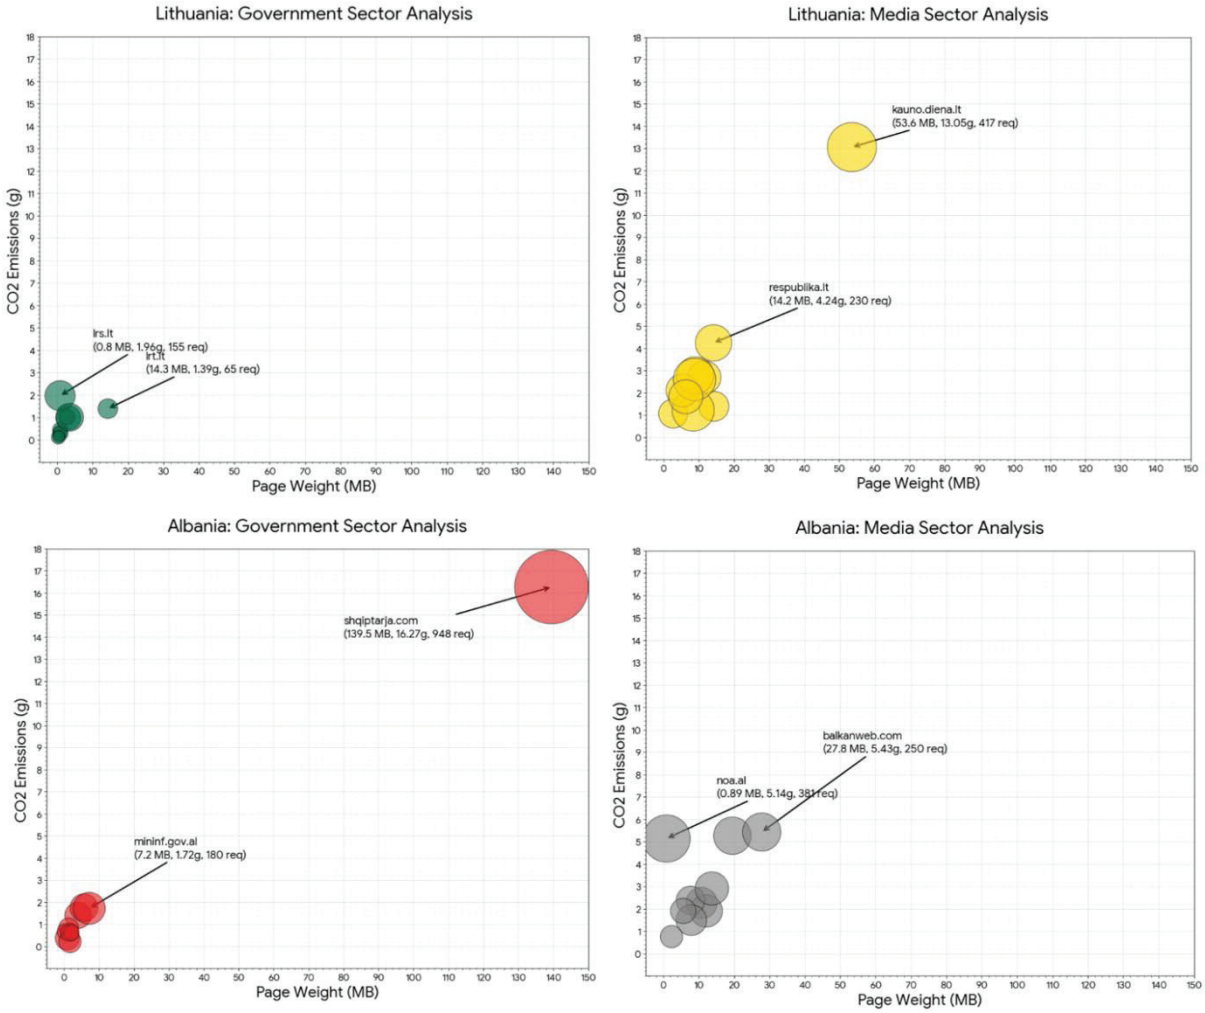

Figure 4. The impact of website page weight on CO_2 emissions

DOM elements and HTTP requests are not equally important for CO_2 emissions. From the data presented in Figure 5, it can be seen that websites with a large number of DOM elements (e.g. 15min.lt – 51508 elements) can have low CO_2 emissions (1.061 g) if the number of HTTP requests is low (88 HTTP requests). This shows that the server load (HTTP requests) has a greater impact on CO_2 emissions than the complexity of the client side (number of DOM elements). For example, tv3.lt has 603 requests and 12604 DOM elements - this indicates a high client-side load, which increases energy consumption. Therefore, simplifying the page architecture can significantly reduce the digital footprint, even if the page weight is not small. Websites that use green energy (most government and media websites) have significantly lower CO_2 emissions, even if the page weight is large. Therefore, using green energy on servers can significantly reduce the digital footprint without major technical changes to the website.

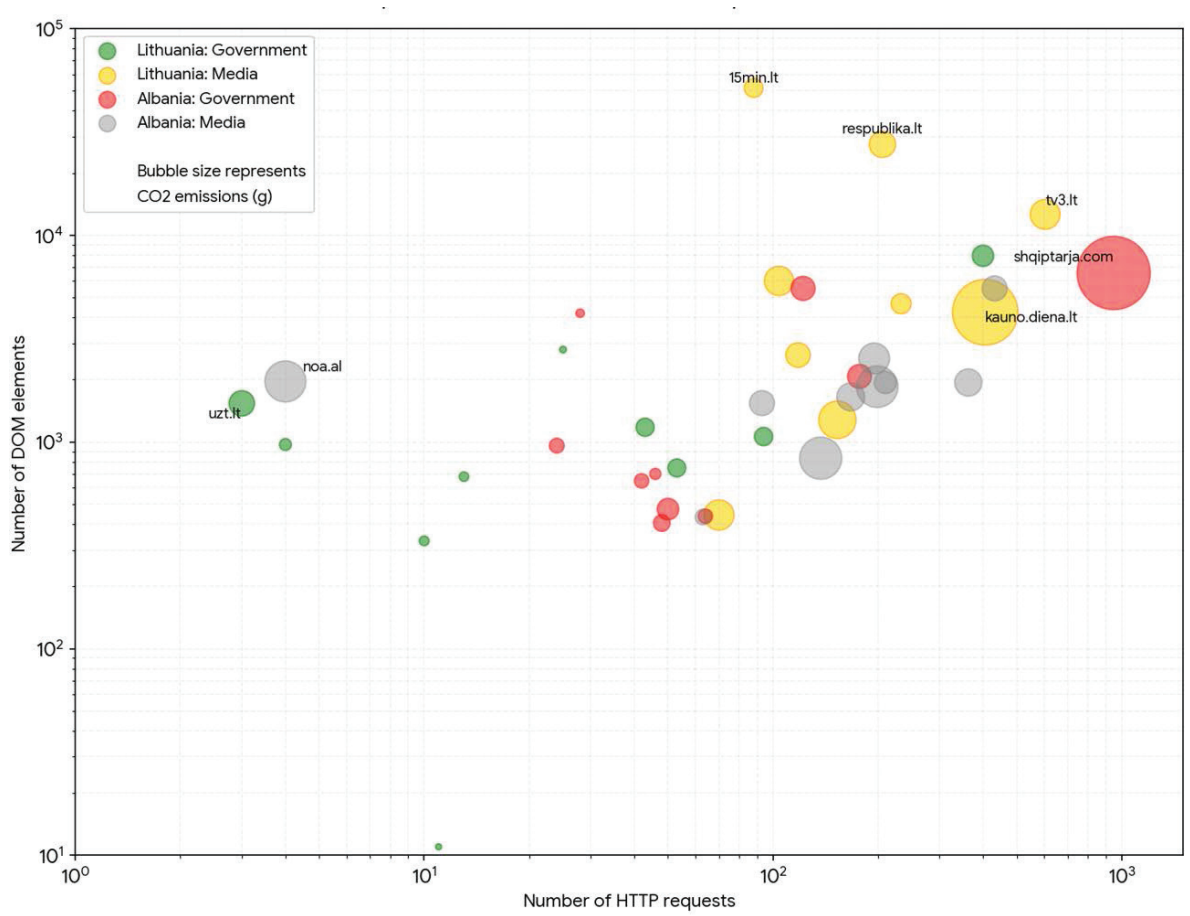

Figure 5. The relationship between website DOM elements and HTTP requests and CO_2 emissions

To more clearly see the distribution of digital footprint indicators of the most popular Lithuanian and Albanian websites evaluated in the study, a digital footprint heat map was created (Figure 6 and Figure 7), which displays the adapted (for the interval 0.0-1.0) values of the 4 indicators used in the measurements.

As can be seen in the heat map of the digital footprint of the analyzed websites (Figure 6), the most popular Lithuanian websites differ significantly in energy efficiency and CO_2 emissions. Websites of government institutions are mostly characterized by lower page weights, fewer HTTP requests and DOM elements, which means their CO_2 emissions remain low (averaging 0.05 on the impact scale). Meanwhile, media websites are more complex (especially kauno.diena.lt, 15min.lt and tv3.lt), they have higher page weights, many HTTP requests or a large number of DOM elements. This leads to higher CO_2 emissions (averaging 0.24 on the impact scale) and indicates that these websites lack code optimization. The most popular websites in Albania (Figure 7) also show significant differences in energy efficiency. Websites of government institutions tend to have lower page weights, fewer HTTP requests and DOM elements, which keeps their CO_2 emissions relatively low (averaging 0.07 on the impact scale). However, shqiptarja.com stands out clearly, with extremely high page weights, HTTP requests and DOM elements, and CO_2 emissions. Media websites generally have a more complex structure and a larger digital footprint (averaging 0.16 on the impact scale).

These data show that the digital footprint is not unambiguous – it is determined by different factors, and their optimization strategies should be adapted to each website separately. Most of

the analyzed websites of both countries (75 %) use green energy, but this does not guarantee a low environmental impact. Therefore, the heat map provides an informative basis for prioritizing optimization efforts - the direct goals should be to reduce the weight of the page and reduce the number of HTTP requests, as these factors are most correlated with CO_2 emissions and energy consumption.

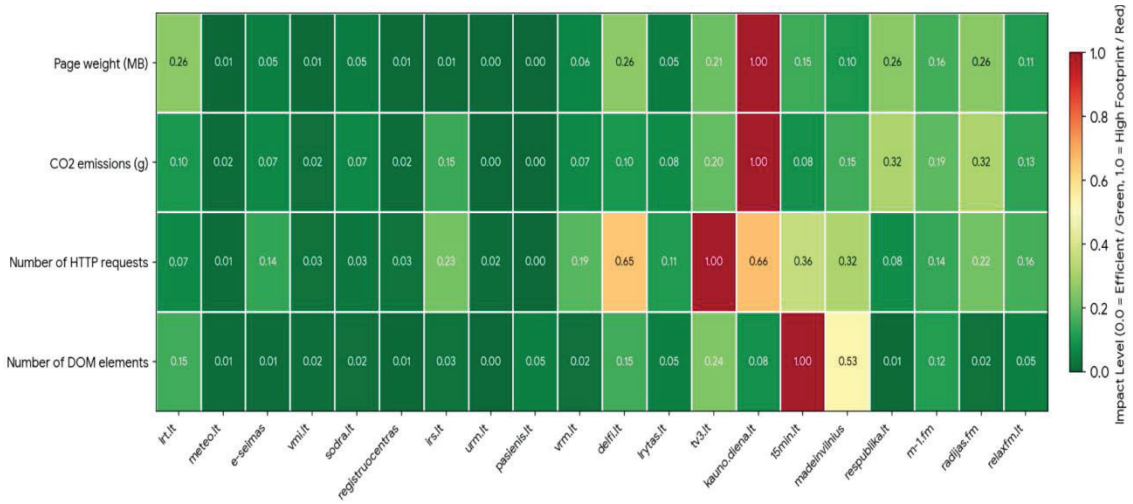

Figure 6. Heatmap of the digital footprint of Lithuania's most popular websites

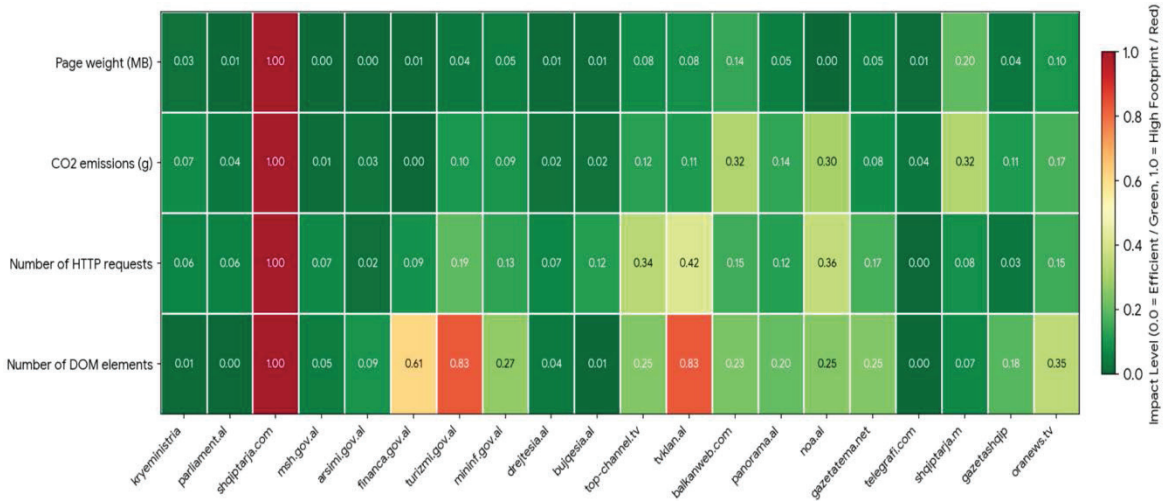

Figure 7. Heatmap of the digital footprint of Albania's most popular websites

Comparing the characteristics of the digital footprint of different sectors according to the four main indicators (Figure 8), it can be seen that Lithuanian media websites are characterized by the highest number of HTTP requests and the largest number of DOM elements. This indicates that these websites are interactive and dynamic, but the CO2 emissions in this sector are average, and the weight of the page is lower than in the websites of government institutions. The indicators for Albanian media websites do not show any significant outliers. Therefore, it can be concluded that media websites have a large digital footprint due to complexity, and not due to large files.

The websites of Albania's government institutions have the highest page weight, which is almost 2 times bigger than the weight of media websites. This indicates that their websites use

large files, but the number of requests and the number of DOM elements, as well as CO2 emissions, are the lowest compared to other sectors. We can observe fairly good results of the indicators of the websites of Lithuanian government institutions, which show that the websites of this sector are sufficiently optimized.

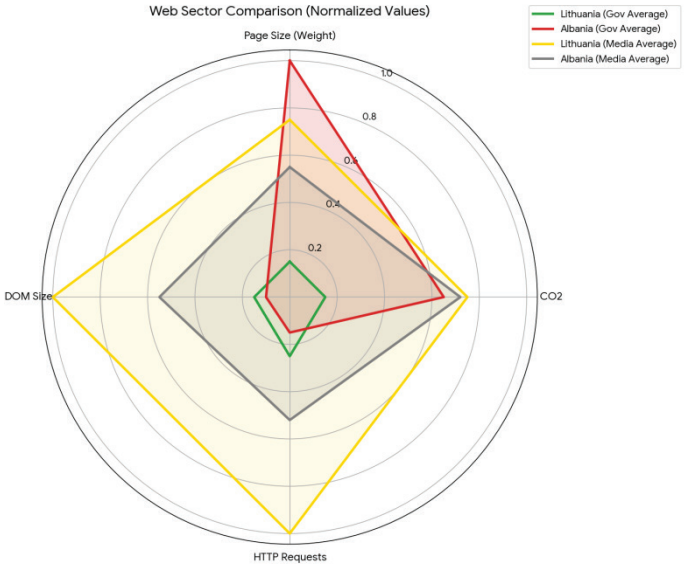

Figure 8. Digital footprint of Lithuania's and Albania's most popular websites by sector

The diagram (Figure 8) shows a normalized comparison of the Lithuanian and Albanian government and media sectors based on four indicators: page weight, CO_2 emissions, number of HTTP requests, and DOM size. The lowest indicators are seen in the Lithuanian government sector – this group is distinguished by low page weight, low number of HTTP requests, and the smallest DOM size. This indicates the best overall technical efficiency and the smallest digital footprint among all the compared groups. The Albanian government sector has the highest page weight, but relatively lower DOM and HTTP requests. This suggests that the higher CO_2 emissions here are more due to heavy content (e.g., large files or multimedia) than to complex page structure.The Lithuanian media sector has the highest number of DOM elements and HTTP requests. This indicates a complex website structure, a large number of scripts, and dynamic content. Although the page weight is not the highest, CO_2 emissions remain high due to technical complexity. The Albanian media sector occupies an intermediate position - indicators are lower than those of the Lithuanian media, but higher than those of the government sectors. This indicates medium technical complexity and a relatively high digital footprint. Media websites in both countries are more technologically complex and less environmentally friendly than government websites, and the biggest impact on emissions is not only the weight of the page, but also the number of HTTP requests and DOM elements.

Since the sources of a website's digital footprint vary, strategies for reducing it should also vary. Media websites should optimize scripts, and government websites should reduce file sizes.

5. Engineering solutions for reducing the digital footprint of a website

By analyzing the results of measuring the digital footprint indicators of the most popular Lithuanian and Albanian websites in different sectors and the causal relationships between these indicators obtained during the study, it is possible to observe the general sequence of actions for website optimization from the perspective of sustainability, i.e. to reduce the damage caused to the increasingly digitalized environment. The website optimization algorithm is presented in Figure 9.

The process of reducing the digital footprint of a website should begin by evaluating whether the website is already in use, or by choosing a hosting server for a newly created website. First of all, it should be taken into account whether the server uses green energy. If green energy is not used, look for the possibility of transferring or hosting the website on a server using green energy. At the same time, it should be evaluated in which physical location the server is located and, if possible, choose a server that is as close as possible to the target audience of website users. This allows creating the conditions for reducing the data transmission path and network energy consumption.

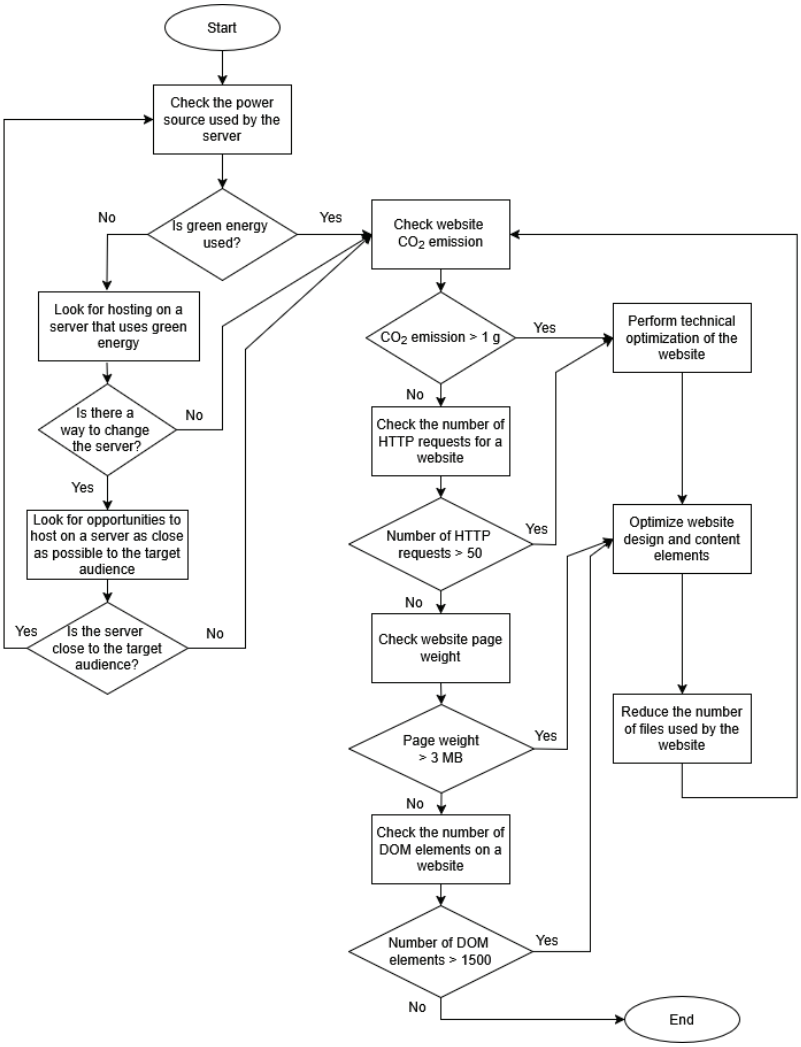

Figure 9. Algorithm flowchart for website optimization from a sustainability perspective

After choosing the most suitable website hosting server, the CO_2 emissions emitted by the website should be further evaluated. If the obtained indicator exceeds 1 g, technical optimization

work on the website should be carried out first: images must be optimized by compressing their files, use their modern formats (e.g. WebP, AVIF), adjust the exact size to the screen; large-scale videos used directly on the website should be hosted in external image containers (e.g. Youtube) and links integrated into the website; CSS, JavaScript, HTML files should be reduced by removing unnecessary spaces, comments, code; deferred loading should be used, when the user's content is loaded only when the user actually accesses it; browser cache settings must be adjusted, which allow the visitor to save part of the website data and when visiting that website again, there is no need to re-send all the website information. The next step is to optimize the website design and content elements, focusing on the most necessary functionality. For this, first of all, the website structure should be reviewed and simplified as much as possible, reduce the number of structural elements, abandoned rarely used functions, used system fonts or limited the number of font styles used, reduce the amount of information provided - leaving only the most useful and relevant for the user. The next step is to review and reduce the number of files used by the website, where possible, merge the contents of files (e.g., JavaScript, CSS) into one, combine them with each other, and check for redundant code files - unused, unpacked CSS styles, JavaScript scripts, external libraries. Third-party plugins used on websites (e.g. chatbots, advertising banners, visitor monitoring tools, analytics tools, social media buttons, widgets, etc.) increase the number of files uploaded, so it is necessary to review their use and leave only those that are necessary to achieve the purposes of using the website.

If the CO_2 emission of a website is measured within the permissible limit, then the number of HTTP requests, the number of DOM elements and the weight of the page should be measured. If values exceeding the permissible limits of the indicator are obtained during a certain measurement, the website optimization actions specified in the algorithm flowchart (Figure 8) should be taken.

Continuously monitoring digital footprint indicators during website development and optimizing the website accordingly contributes to the creation of a more sustainable digital space.

6. Conclusions

1. The digital footprint of a website is a complex indicator that is determined by the weight of the website, the volume of data transfer (HTTP requests), the website architecture (the number of DOM elements) and the infrastructure (the energy of the server where the website is hosted). Therefore, only an overall evaluation of these individual indicators allows us to determine the environmental impact of a website and identify optimization priorities.
2. The study revealed differences between the studied sectors - media websites of both counties generate the highest CO_2 emissions, government institution websites - the lowest. The analysis also showed that CO_2 emissions in different sectors are determined by different factors. The greatest influence on media websites is the amount of content, a large number of HTTP requests and a complex website structure, therefore, in this case, the most effective direction for reducing the digital footprint is to reduce the number of HTTP requests and optimize the page structure in order to reduce the overall system load. On government websites, the number of HTTP requests has the greatest negative impact on CO_2 emissions, so the most effective optimization direction is to reduce them in order to reduce server load and data transfer intensity. Thus, different factors dominate in each sector, forming the overall digital footprint, so the specifics of the sector also require different optimization strategies.
3. The study found that the number of HTTP requests has a greater impact on CO_2 emissions than the number of DOM elements, and the use of green energy can significantly reduce the digital footprint but cannot fully compensate for the use of excess resources or unoptimized

code. Although the strategies for reducing the digital footprint of websites in different sectors and different countries differ, a generalized sequence of actions developed by observing general trends creates the prerequisites for reducing the digital footprint of a website and contributing to the development of a more sustainable digital society.

Dhuna në marrëdhëniet familjare - Pse xhelozia e burrave vret?

Dr. Bajram Ibraj

Fakulteti i Ekonomise, Drejtesise dhe Shkencave Sociale, Kolegji Universitar i Biznesit, Tiranë, Shqiperi.

E-mail: bajram.ibraj@kub.edu.al: https://orcid.org/0009-0006-1006-5379

Abstrakt

Dhuna familjare përbën një problem të rëndësishëm ligjor, kriminal, social dhe psikologjik që prek jo vetëm viktimat, por edhe strukturën dhe funksionimin e familjes në tërësi. Prandaj, punimi me titull: "Dhuna në marrëdhëniet familjare-Pse xhelozia e burrave vret?", trajton fenomenin e dhunës në marrëdhëniet familjare, me fokus të veçantë tek ndikimi i xhelozisë mashkullore në ushtrimin e dhunës ndaj partneres.

Ky punim trajton këto çështje; Çfarë është dhuna në marrëdhëniet familjare?, kuadri ligjor kombëtar për çështjet e dhunës në marrëdhëniet familjare, veprat penale për dhunën në marrëdhëniet familjare; komentar i ligjit për masa ndaj dhunës në marrëdhëniet familjare, pse xhelozia e burrave vret?-"Xhelozia, e kombinuar me faktorë psikologjikë, socialë dhe kulturorë, është një nga motivet kryesore në vrasjet e partnerit intim", disa statistika në lidhje me vrasjet e e grave nga xhelozia e burrave; analizë e vendimeve gjyqësore - Vrasjet e grave nga partnerët - modeli juridik dhe motivi i xhelozisë- dhe përfundime dhe rekomandime.

Qëllimi i këtij punimi është të analizojë fenomenin e dhunës në marrëdhëniet familjare dhe faktorët që ndikojnë në shfaqjen e saj, me fokus të veçantë tek xhelozia mashkullore si një ndër shkaqet kryesore të konflikteve dhe dhunës ndaj partneres. Gjithashtu, studimi ka për qëllim të rrisë ndërgjegjësimin shoqëror mbi rëndësinë e parandalimit të dhunës familjare dhe nevojën për mbështetje institucionale, edukim dhe promovim të marrëdhënieve të shëndetshme në familje.

Objektivi i këtij punimi është të analizohet dhuna në marrëdhëniet familjare dhe ndikimi i xhelozisë mashkullore në ushtrimin e saj dhe pasojat që ajo sjell tek viktimat dhe familja.

Punimi synon të evidentojë lidhjen ndërmjet xhelozisë, kontrollit dhe agresivitetit në familje, si edhe pasojat psikologjike, emocionale dhe sociale që kjo dhunë sjell tek viktimat dhe familja në tërësi. Studimi synon të analizojë faktorët që ndikojnë në shfaqjen e dhunës, format kryesore të saj dhe lidhjen që ekziston ndërmjet xhelozisë, kontrollit dhe agresivitetit në marrëdhëniet në çift.

Fjalë kyçe: *Dhuna, marrëdhëniet familjare, xhelozia, burrat, vrasja.*

Hyrje

Dhuna në marrëdhëniet familjare mbetet një ndër problemet më shqetësuese sociale në shoqërinë moderne. Një nga faktorët që shpesh lidhet me ushtrimin e dhunës është xhelozia e tepruar dhe ekstreme, e cila në shumë raste shndërrohet në kontroll, kërcënim dhe agresion ndaj partneres. Ky studim synon të analizojë lidhjen midis xhelozisë mashkullore dhe dhunës familjare, duke evidentuar faktorët që ndikojnë në përshkallëzimin e saj dhe pasojat që ajo sjell në jetën e viktimave dhe familjes në tërësi.

Ky punim trajton këto çështje; hyrje; Çfarë është dhuna në marrëdhëniet familjare?, kuadri ligjor kombëtar për çështjet e dhunës në marrëdhëniet familjare, veprat penale për dhunën në marrëdhëniet familjare; komentar i ligjit për masa ndaj dhunës në marrëdhëniet familjare, pse xhelozia e burrave vret?-"Xhelozia, e kombinuar me faktorë psikologjikë, socialë dhe kulturorë,

është një nga motivet kryesore në vrasjet e partnerit intim", disa statistika në lidhje me vrasjet e e grave nga xhelozia e burrave;analizë e vendimeve gjyqësore - Vrasjet e grave nga partnerët - modeli juridik dhe motivi i xhelozisë- dhe përfundime dhe rekomandime.

Metodologjia. Metodologjia e përdorur ka të bëjë me analizimin e kuadrit ligjor për çështjet e dhunës në marrëdhëniet familjare, veprave penale, si dhe janë bërë analiza të vendimeve gjyqësore. Punimi bazohet në:analizë teorike (literaturë shkencore), analizë juridike (legjislacioni shqiptar & ndërkombëtar), analizë jurisprudenciale (vendime gjyqësore) dhe të dhëna statistikore ndërkombëtare dhe vendore.

Pyetje kërkimore: 1. Çfarë është dhuna në marrëdhëniet familjare? 2. Cili është kuadri ligjor kombëtar për çështjet e dhunës në marrëdhëniet familjare? 3. Cilat janë veprat penale për dhunën në marrëdhëniet familjare? 4. Pse xhelozia e burrave vret? 5. Si ndikon xhelozia mashkullore në përshkallëzimin e konflikteve familjare? A është xhelozia shkaku kryesor i femicidit? Si ndërveprojnë faktorët psikologjikë dhe socialë në dhunë?

Hipoteza: Dhuna, në marrëdhëniet familjare dhe xhelozia nuk janë shkak i vetëm i vrasjeve në marrëdhënie intime, por një katalizator i fuqishëm i dhunës ekstreme.

1. Çfarë është dhuna në marrëdhëniet familjare?

Le të trajtojmë disa përkufizime të dhunës në marrëdhëniet familjare sipas autorëve të ndryshëm:

Hunnicutt (2009) ofron një nga përkufizimet më gjithëpërfshirëse dhe të sakta të patriarkatit:

Ajo pohon se "[...] kjo do të thotë rregullime shoqërore që privilegjojnë meshkujt, ku burrat si grup dominojnë gratë si grup, si në aspektin strukturor ashtu edhe në atë ideologjik-hierarkik rregullime që manifestohen në varietete përgjatë historisë dhe hapësirës shoqërore" (557). Ky përkufizim është i ngjashëm me të tjerët që kanë vënë re se patriarkati nuk është statik (Beechey 1979; Chafetz 2004; Fox 1988; Pateman 1988, 1989; Walby 1990; Zajicek dhe Calasanti 1998).[30] Ato, pohojnë se është një sistem ku babai është kreu i familjes. Një sistem ku burrat dominojnë dhe kontrollojnë gratë nuk ka pasur kurrë një homolog të barabartë në histori ku gratë dominojnë dhe kontrollojnë burrat (Crane-Seeber dhe Crane 2010;Eller 2000)".[31]

Michael P. Johnson (2008), -"Patriarchy, the System: An Itsy-Bitsy History", ka propozuar:

"një përkufizim të dhunës në marrëdhëniet familjare si çdo akt që ka për qëllim të shkaktojë dëmtim fizik, psikologjik, apo emocional ndaj një individi të tjetër në një marrëdhënie intime. Ai e konsideron këtë dhunë një formë të kontrollit dhe dominimit të një personi ndaj një tjetri".[32]

Ellen Pence & Michael Paymar: "Education Groups for Men Who Batter:The Duluth Model:

"definojnë dhunën në marrëdhëniet familjare si përdorimin e forcës dhe intimidimit për të kontrolluar partnerin intim, përfshirë përdorimin e fjalëve të dhunshme dhe agresionin psikologjik."[33]

Judith Lewis Herman (1992), "Trauma and Recovery", e përkufizon:

[30]Jesse Robert McKee B.S. May 2006, Northern Arizona University M.A. May 2008, Northern Arizona University, "Patriarchal Ideology and Violence Against Women: A Theoretical Contribution Using Longitudinal, Individual-Level Analyses", 2014, page 17.
[31]Ibid., page 15-16.
[32]Michael P. Johnson, "Patriarchy, the System: An Itsy-Bitsy History," 2008.
[33]Ellen Pence dhe Michael Paymar, "Education Groups for Men Who Batter: The Duluth Model," 1993.

"dhunën në marrëdhëniet familjare si një formë të abuzimit sistematik që shkakton traumë të thellë psikologjike dhe fizike. Ajo thekson rëndësinë e mendimit mbi dhunën si një fenomen që ndodhi brenda një dinamike të kontrolluar dhe të vazhdueshme."[34]

Lenore E.Walker(1979)"The Battered Woman",e konsideron:

"dhunën në marrëdhëniet familjare një formë të ciklit të dhunës që ndodh në mënyrë të përsëritur dhe me ndërprerje, ku viktima mund të përjetojë një periudhë të dukshme pa dhunë, por që pastaj përsëri përfshihet në një cikël të rrezikshëm."[35]

Murray Straus (1990)"Physical Violence in American Families: Risk Factors and Adaptations to Violence in 8,145 Families", e përkufizon:

"dhunën në marrëdhëniet familjare si përdorimin e dhunës fizike dhe emocionale për të imponuar kontrollin brenda familjes. Ai e përfshin edhe dhunën si rezultat të konflikteve të pakontrolluara dhe stresit në marrëdhëniet e përditshme."[36]

Konventa e Stambollit dhe ndryshimet në ligjin për dhunën në familje, neni 3:[37]

*a.**"dhunë kundër grave"** kuptohet si shkelje e të drejtave të njeriut dhe një formë diskriminimi kundër grave dhe nënkupton të gjitha aktet e dhunës gjinore që çojnë ose mund të çojnë në dëmtim ose vuajtje fizike, seksuale, psikologjike ose ekonomike për gratë, duke përfshirë kërcënime për kryerjen e këtyre akteve, shtrëngim ose heqje arbitrare të lirisë, qoftë nëse ndodh në jetën publike ose private; b.**"dhunë në familje"** nënkupton të gjitha aktet e dhunës fizike, seksuale, psikologjike ose ekonomike që ndodhin brenda familjes ose njësisë shtëpiake, ose ndërmjet ish bashkëshortëve ose partnerëve ose ndërmjet bashkëshortëve ose partnerëve aktualë, pavarësisht nga fakti nëse autori i veprës penale ndan ose ka ndarë të njëjtën banesë me viktimën;*

Sipas ligjit nr.9669, datë 18.12.2006 "Për masa ndaj dhunës në marrëdhëniet familjare" (Ndryshuar e përditësuar),[38] jep këto perkufizime për termat:

***"Dhunë në familje",** gjithashtu, në të njëjtin ligj sa më sipër, përkufizohet "Çdo veprim ose mosveprim i një personi ndaj një personi tjetër, që sjell si pasojë cenim të integritetit fizik, moral, psikologjik, seksual, social, ekonomik, që ndodh brenda familjes ose njësisë shtëpiake, e ushtruar ndërmjet pjesëtarëve të familjes, që janë ose kanë qenë në marrëdhënie familjare, pavarësisht nga fakti nëse dhunuesi ndan ose ka ndarë të njëjtën banesë me viktimën.*

2. Kuadri ligjor kombëtar për çështjet e dhunës në marrëdhëniet familjare

Ky kuadër ligjor për çështjet e dhunës në marrëdhëniet familjare përbëhet nga ligjet e mëposhtme:

1.Ligji i parë i miratuar nga Kuvendi i Shqipërisë"Për masa ndaj dhunës në marrëdhëniet familjare",i përket, ligji nr.9669, datë 18.12.2006.

Qëllimi i ligjit është që të parandalojë dhe zvogëlojë dhunën në familje në të gjitha format e saj dhe të mbrojë viktimat përmes një procedure të shpejtë, të përballueshme dhe të thjeshtë. Dy përmirësimet më të rëndësishme të këtij ligji datojnë në vitet 2018 dhe 2020.

[34]Judith Lewis Herman,"Trauma and Recovery", 1992.
[35]Lenore E. Walker,"The Battered Woman",1979.
[36]Murray Straus, "Physical Violence in American Families: Risk Factors and Adaptations to Violence in 8,145 Families," 1990.
[37]Council of Europe Treaty Series - № 210, Konventa e Këshillit të Europës për parandalimin dhe luftimin e dhunës kundër grave dhe dhunës në familje, Stamboll, 11.V.2011, neni 3, faqe 5. www.coe.int/conventionviolence.Ligj nr. 104/2012 "Për Ratifikimin e Konventës së Këshillit të Europës "Për parandalimin dhe luftën kundër dhunës ndaj grave dhe dhunës në familje".
[38]Ligji nr.9669, datë 18.12.2006 "Për masa ndaj dhunës në marrëdhëniet familjare" (Ndryshuar me ligjin nr. 9914, datë 12.5.2008, nr.10 329, datë 30.9.2010, nr. 47/2018, datë 23.7.2018, nr.125/2020, datë 15.10.2020) (I përditësuar), neni 4.

2. Ligji 47/2018 "Për disa shtesa dhe ndryshime në ligjin nr.9669, datë 18.12.2006"Për masa ndaj dhunës në marrëdhëniet familjare."

Nëpërmjet ndryshimeve të bëra, u forcuan masat mbrojtëse dhe proceduriale për një përgjigje më efektive ndaj dhunës në familje dhe mbrojtja e viktimave, përmes lëshimit të Urdhrit për Masat Paraprake të Mbrojtjes së Menjëhershme, i paraprirë nga vlerësimi i riskut, për çdo rast që trajtohet. Gjithashtu, për herë të parë, mbrohen gratë dhe vajzat në marrëdhënie intime, pa pasur lidhje formale me dhunuesit, si martesa ose bashkëjetesa.

3.Ligji 125/2020 "Për disa shtesa dhe ndryshime në ligjin nr.9669, datë 18.12.2006 "Për masa ndaj dhunës në marrëdhëniet familjare".

Nëpërmjet këtij ligji përcaktohen masat për largimin menjëherë të dhunuesit nga banesa nëpërmjet UMPMM nga Policia e Shtetit, apo nëpërmjet UMM/UM të lëshuar nga Gjykata për atë afat kohor që përcaktohet në këto urdhra, programet specifike të rehabilitimit për dhunuesit, etj.

4.Ligji nr.35/2020"Për një ndryshim në ligjin nr.7895,datë 27.01.1995,"KP i RSH",i ndryshuar.

Neni 130/a"Dhuna në familje".[39]Në këtë nen parashikohet që për rrahjen tëdënohet me burgim deri në tre vjet; për kanosja serioze për vrasje ose plagosje të rëndë, ndaj personit që është bashkëshort, etj..., dënohet me burgim deri në katër vjet; plagosja e kryer me dashje, ndaj personit që është bashkëshort, ...etj, dënohet me burgim deri në pesë vjet.

5.Ligji nr.47/2018, datë 23.07.2018 "Për disa shtesa dhe ndryshime në ligjin nr. 9669, datë 18.12.2006,"Për masa ndaj dhunës në marrëdhëniet familjare""të ndryshuar.

Ky ligj parashikon masa ligjore për parandalimin dhe reduktimin e dhunës në familje, si dhe mbrojtjen e viktimave, me fokus të veçantë te fëmijët, të moshuarit dhe personat me aftësi të kufizuara. Ndryshimet e tij kanë zgjeruar rrethin e subjekteve të mbrojtura duke përfshirë edhe marrëdhëniet intime dhe ato të kujdestarisë. Gjithashtu, ai vendos detyrime të posaçme për Policinë e Shtetit dhe sistemin e drejtësisë penale, përfshirë masat e menjëhershme mbrojtëse sipas nenit 13/1 Urdhri për masat paraprake të mbrojtjes së menjëhershme.

3. Veprat penale për dhunën në marrëdhëniet familjare

Në këtë çështje fillimisht do të referohem Jonathan Herring autor i librit "E Drejta Penale, Teori, kazuse dhe materiale", me parathënie, Spartak Ngjela, 2013, në lidhje me. mendimin ligjor feminist ku theksohet se: "Analizat feministe kanë provuar një influencë të fuqishme në studimin e së drejtës penale. Shumë punë është bërë për nxjerrjen në pah të padrejtësive ndaj grave brenda sistemit të drejtësisë penale. Merrni në konsideratë për shembull aktakuzën e mëposhtme të sistemit të së drejtës penale:

*"**Dhuna në familje** përbën çerekun e të gjithë krimeve, dhe gjithsesi vetëm 5% e rasteve të regjistruara të dhunës në familje përfundojnë në dënim, më pak se 20% të përdhunimeve dhe sulmeve seksuale raportohet në polici, dhe më pak se 6% e përdhunimeve përfundojnë me dënim. Tani ka më shumë se 4.500 femra në burg, një rritje me 194% në 10 vitet e fundit. Pjesa më e madhe e femrave dënohen për vepra penale jo të dhunshme, të tilla si vjedhja e dyqaneve. Një femër në 12 gjyqtarë në Dhomën e Lordëve, 5 femra me 43 shefa policie, 18 femra me 42 oficerë drejtues të shërbimit të provës, 7 femra nga 42 kryeprokurorë të Kurorës, 31 femra nga 138 guvernatorë burgjesh. Ka pasur prova të ngacmimeve dhe diskriminimeve seksuale të përjetuara nga femrat që*

[39]Ligj nr. 23/2012, datë 1.3.2012 "Për disa shtesa dhe ndryshime në ligjin nr. 7895, datë 27.1.1995 "Kodi Penal i Republikës së Shqipërisë", të ndryshuar, neni 17, ndryshuar paragrafi i fundit me ligjin nr.144, datë 2.5.2013, neni 33.

punojnë në sistem."[40]*"Nuk duhet të mendohet se kontributi i vetëm i feminizmit është nxjerrja në pah e shembujve të stereotipizimeve gjinore mes gjyqësorit dhe juristëve, (rastet e përdhunimeve janë plot), apo shembuj kur ligji në mënyrë të pajustifikueshme i trajton femrat dhe meshkujt në mënyrë të ndryshme, (shtrëngimi mund të jetë një shembull i kësaj, për faktin se është i disponueshëm si mbrojtje për bashkëshortet, por jo për bashkëshortët).*[41]

Dhuna në familje dhe krimet seksuale mbeten fenomene të nënraportuara dhe me nivel të ulët ndëshkueshmërie, ku vetëm një pjesë shumë e vogël e rasteve përfundojnë me dënim. Po ashtu, raportohen pabarazi në sistemin e drejtësisë penale dhe përfaqësim i kufizuar i grave në pozita drejtuese brenda institucioneve ligjzbatuese, çka lidhet edhe me raste të diskriminimit dhe ngacmimeve gjinore. Në këtë kontekst, theksohet se debati mbi feminizmin nuk kufizohet vetëm te evidentimi i stereotipeve gjinore apo pabarazive ligjore, por përfshin edhe analizën e mënyrës se si ligji dhe praktika juridike trajtojnë ndryshe burrat dhe gratë në situata të ngjashme juridike.

Pra, shifrat e trajtuara më sipër për dhunën në familje që përbëjnë çerekun e të gjithë krimeve dhe gjithsesi vetëm 5% e rasteve të regjistruara të dhunës në familje përfundojnë në dënim, ...etj tregojnë përmasat e mëdha të krimit të dhunës në familje sot në mbarë botën. Prandaj, pas këtyre shifrave e statistikave, le ti referohemi veprave penale për dhunën në marrëdhëniet familjare në Shqipëri.

Veprat penale për dhunën në marrëdhëniet familjare dhe veprat penale që lidhen me dhunën e krimet në familje, janë:Neni 79/c -Vrasja për shkak të marrëdhënieve familjare;[42]Neni 80;[43]Neni 81-Vrasja e foshnjës;[44]Neni 82-Vrasja e kryer në gjendje të tronditjes së fortë psikike;[45]Neni 88/2-Plagosja e rëndë me dashje;[46]Neni 99-Shkaktimi i vetëvrasjes;[47]Neni 106 - Marrëdhënie seksuale ose homoseksuale me persona në gjini ose nën kujdestari;[48]Neni 107/a-Dhuna seksuale;Neni 108/2-Vepra të turpshme;[49]Neni 108/a-Ngacmimi seksual;[50]Neni 114/2-Shfrytëzimi i prostitucionit;[51]Neni 124-Braktisja e fëmijëve të mitur;[52]Neni 124/b-Keqtrajtimi i të miturit;[53]Neni 125-Mosdhënia e mjeteve për jetesë;[54]Neni 127-Marrja e padrejtë e

[40]Jonathan Herring "E Drejta Penale, Teori, kazuse dhe materiale", Parathënie, Spartak Ngjela, Botimi V/Volumi I, UET Press, Tiranë, tetor 2013, faqe 59-60.

[42]Kodi Penal i Republikës së Shqipërisë, neni 79/c Vrasja për shkak të marrëdhënieve familjare *(Shtuar me ligjin nr. 144/2013).* "Vrasja me dashje e personit që është **bashkëshort, ish-bashkëshort, bashkëjetues apo ishbashkëjetues, gjini e afërt ose krushqi e afërt** me autorin e veprës penale, dënohet me burgim jo më pak se njëzet vjet ose me burgim të përjetshëm."
[43]Kodi Penal i Republikës së Shqipërisë, neni 80. Sigurimi i kushteve dhe i mjeteve materiale për të kryer vrasje dënohet me burgim gjer në pesë vjet.
[44]Kodi Penal i Republikës së Shqipërisë, *(Ndryshuar fjalët me ligjin nr.144, datë 2.5.2013, neni 17)* Vrasja e foshnjës e kryer me dashje nga **nëna**, menjëherë pas lindjes, dënohet me burgim deri në pesë vjet.
[45]Vrasja me dashje e kryer në gjendje të tronditjes së fortë psikike të çastit shkaktuar nga **dhuna** ose fyerja e rëndë e viktimës dënohet me burgim gjer në tetë vjet.
[46]*(Ndryshuar paragrafi i dytë meligjin nr.144, datë 2.5.2013, neni 18).* Po kjo vepër, kur është kryer kundër disa personave, kundër personit që është **bashkëshort, ishbashkëshort, bashkëjetues apo ish-bashkëjetues, gjini e afërt ose krushqi e afërt** me autorin e veprës penale, ose kur ka sjellë si pasojë vdekjen, dënohet me burgim nga pesë deri në pesëmbëdhjetë vjet.
[47]*(Ndryshuar fjalët me ligjin nr.144, datë 2.5.2013, neni 19).* Shkaktimi i vetëvrasjes ose i tentativës së vetëvrasjes të një personi, si rrjedhojë e trajtimit të keq sistematik ose nga sjellje të tjera sistematike që prekin rëndë dinjitetin, të kryera nga personi që e ka në varësi apo nga personi me të cilin ka **marrëdhënie familjare ose bashkëjetese**, dënohet me burgim nga tre deri në shtatë vjet.
[48]*(Ndryshuar me ligjin nr.8733, datë 24.1.2001, neni 22).* Kryerja e marrëdhënieve seksuale ose homoseksuale **ndërmjet prindit dhe fëmijës, vëllait dhe motrës, ndërmjet vëllezërve, motrave**, ndërmjet personave të tjerë që janë **gjini në vijë të drejtë** ose me persona që ndodhen në raporte kujdestarie ose të birësimit, dënohet me burgim gjer në shtatë vjet.
[49]*(Ndryshuar me ligjin nr.8733, datë 24.1.2001, neni 24; ndryshuar me ligjin nr.23/2012, datë 1.3.2012, neni 11; shtuar paragrafët me ligjin nr.144, datë 2.5.2013, neni 23;)* Po kjo vepër, kur kryhet ndaj një të mituri që nuk ka arritur moshën katërmbëdhjetë vjeç, me të cilin autori ka **marrëdhënie familjare**, dënohet me burgim nga pesë deri në dhjetë vjet.
[50]"Kryerja e sjelljeve me natyrë seksuale, që cenojnë dinjitetin e një personi, me çdo mjet ose formë, duke krijuar një mjedis kërcënues, armiqësor, degradues, poshtërues ose ofendues, përbën vepër penale dhe dënohet me burgim nga një deri në pesë vjet. Kur kjo vepër kryhet në bashkëpunim, kundër disa personave, më shumë se një herë **ose kundër fëmijëve**, dënohet me burgim nga tre deri në shtatë vjet".
[51]*(Ndryshohet titulli dhe shfuqizohet paragrafi II me ligjin nr.8279, datë 15.1.1998, neni 2; ndryshuar me ligjin nr.144, datë 2.5.2013, neni 28).* ...dënohet me burgim nga shtatë deri në pesëmbëdhjetë vjet.
[52]*(Ndryshuar paragrafi I me ligjin nr.8733, datë 24.1.2001, neni 34).* …dënohet me gjobë ose me burgim gjer në tre vjet. Kur nga vepra është shkaktuar dëmtimi i rëndë i shëndetit ose vdekja e fëmijës, dënohet me burgim nga tre gjer në dhjetë vjet.
[53]*(Shtuar me ligjin nr.9859, datë 21.1.2008, neni 2; ndryshuar me ligjin nr.23/2012, datë 1.3.2012, neni 16; ndryshuar paragrafi i dytë me ligjin nr.144, datë 2.5.2013, neni 30).*

fëmijës;[55]Neni 130-Shtrëngimi apo pengimi për të bashkëjetuar ose për të lidhur apo zgjidhur martesë;[56]Martesa e detyruar;[57]Krimet në emër të "nderit";[58]Neni 130/a-Dhuna në familje.[59]Pra, dhuna në familje është vepër penale, dhe përbëhet edhe nga dhuna fizike, dhuna psikologjike, dhuna ekonomike, dhuna seksuale dhe termat sulm seksual, përdhunim, abuzim seksual dhe dhuna seksuale përdoren shpesh në mënyrë të ndërsjellë.

4. Komentar i ligjit për masa ndaj dhunës në marrëdhëniet familjare

Komentari i ligjit për masa ndaj dhunës në marrëdhëniet familjare, është bërë në muajin dhjetor 2021ngaProf. dr. Arta Mandro (Neni 2,3,3/1,4,9,11,13,15,18); Prof. dr. Aurela Anastasi (Neni 1,10,12,13/1,20,21,22,23,24); Prof. dr. Mariana Semini (Neni 5,6,7,7/1,8,14,16,17,19,), por po i referohemi në këtë punim vetëm neneve 1, qëllimi dhe neni 2 qëllimi dhe struktura e nenit.

Neni 1 Qëllimi:

Ky ligj ka për qëllim: 1. Parandalimin dhe reduktimin e dhunës në familje në të gjitha format e saj, me anë të masave të përshtatshme ligjore dhe të masave të tjera të nevojshme. 2.Garantimin e mbrojtjes me masa ligjore dhe me masa të tjera të nevojshme të pjesëtarëve të familjes, të cilët janë viktima të dhunës në familje, duke u kushtuar vëmendje të veçantë grave, vajzave, fëmijëve, të moshuarve dhe personave me aftësi të kufizuara, subjekt i këtij ligji, sipas nenit 3 të tij.[60]

Neni 2 Qëllimi dhe struktura e nenit:

2. Në një kuptim të ngushtë e më të detajuar, qëllimi i ligjit mund të përmblidhet në prezantimin e objektivave të tij, si: parandalimi i dhunës në familje, luftimi i saj, si dhe mbrojtja e viktimave të dhunës në familje në të gjitha format me të cilat ajo shfaqet. Këto objektiva do të përmbushen përmes masave të veçanta, të cilat janë masa të parashikuara nga vetë ligji ose masa të tjera të nevojshme që ndërmerren rast pas rasti nga institucionet përkatëse.

4. Neni 1 rendit kategoritë që kërkojnë ***mbrojtje të veçantë****: gratë, vajzat, fëmijët, të moshuarit dhe personat me aftësi të kufizuara. Ndryshimet ligjore të vitit 2020,*[61]*sollën në vëmendje edhe gratë e vajzat si kategori të posaçme, të cilat ligji i mbron në mënyrë të veçantë. Më parë, ishin renditur vetëm fëmijët, të moshuarit dhe personat me aftësi të kufizuara.*

5. Përfshirja në kategoritë që gëzojnë një mbrojtje të posaçme nga ligji edhe e grave e vajzave ka qëllim të përafrojë më tepër këtë ligj, me Konventën e Këshillit të Evropës "Për parandalimin dhe luftimin e dhunës ndaj grave dhe dhunës në familje" (Konventa e Stambollit).[62]*Sidoqoftë, ligji nuk e*

[54]Mosdhënia e mjeteve të nevojshme **për jetesën e fëmijëve, të prindërve ose të bashkëshortit**, nga personi që në zbatim të një vendimi gjyqësor detyrohet ta japë, përbën kundërvajtje penale dhe dënohet me gjobë ose me burgim gjer në një vit.
[55]Marrja e padrejtë e fëmijës, duke e larguar prej personit që ushtron **autoritetin prindëror** ose që i është besuar për rritje dhe edukim, si dhe mosdorëzimi **i fëmijës prindit tjetër** në zbatim të vendimit gjyqësor, përbën kundërvajtje penale dhe dënohet me gjobë ose me burgim gjer në gjashtë muaj.
[56]*(Ndryshuar me ligjin nr.144, datë 2.5.2013, neni 32).*
[57]Përdorimi i qëllimshëm i kërcënimeve apo detyrimi i një të rriture apo i të rrituri ose **fëmije për të lidhur martesë**. Termi "detyrim" i referohet forcës fizike dhe psikologjike ku përdoret shtrëngimi dhe presioni.
[58]Çdo lloj akti dhune apo kërcënimi ku kultura, zakonet, besimi, tradita apo i ashtuquajturi "nder", përdoren si justifikim për veprime të tilla.
[59]*(Shtuar me ligjin nr.23/2012, datë 1.3.2012, neni 17; ndryshuar paragrafi i fundit me ligjin nr.144, datë 2.5.2013, neni 33).* Rrahja, si dhe çdo vepër tjetër dhune, ndaj personit që është **bashkëshort, ish-bashkëshort, bashkëjetues apo ish-bashkëjetues, gjini e afërt ose krushqi e afërt** me autorin e veprës penale. …dënohet me burgim gjer në dy vjet.
[60]Ligji nr.47/2018, datë 23.07.2018 "Për disa shtesa dhe ndryshime në ligjin nr. 9669, datë 18.12.2006, "Për masa ndaj dhunës në marrëdhëniet familjare" të ndryshuar.
[61]Ligji nr. 125/2020, "Për disa shtesa dhe ndryshime në ligjin nr. 9669, datë 18.12.2006, "Për masa ndaj dhunës në marrëdhëniet familjare", i ndryshuar.
[62]"Konventa e Këshillit të Europës për parandalimin dhe luftimin e dhunës kundër grave dhe dhunës në familje" CAHVIO, ratifikuar më 4 shkurt 2013.

shtrin mbrojtjen e grave e të vajzave tej dhunës të ushtruar në marrëdhëniet familjare, sikurse bën kjo e fundit. Duket qartë se objekti i ligjit është i ngushtuar vetëm brenda familjes.[63]

5. Pse xhelozia e burrave vret? - "Xhelozia, e kombinuar me faktorë psikologjikë, socialë dhe kulturorë, është një nga motivet kryesore në vrasjet e partnerit intim-."

Të them të drejtën kohë më parë nuk e kisha menduar që xhelozia e burrave vret. Kisha menduar se xhelozia është "femërore" dhe mbaron me a dhe Inati mbaron me i dhe është "mashkullor". Por vërtetë mu desh të hulumtoja për xhelozinë e burrave. Natyrshëm lind pyetja: Sa është niveli i xhelozisë së burrit? Frojdi ishte i pari që e zbuloi dhe e provoi në mënyrë brilante se xhelozia është hakmarrje. Në krime i çon dyshimi patologjik.Si mund të vrasë njeriu nga xhelozia/Njeriu vret nga xhelozia. Nuk vret nga dashuria. Psikoanaliza e ka ngritur me lart.[64]

Fillimisht le të referohemi përkufizimit të xhelozisë sipas Frojdit.

Frojdi (1922) e përcaktoi xhelozinë si më poshtë: "Është e lehtë të shihet se në thelb ajo përbëhet nga pikëllimi, dhimbja e shkaktuar nga mendimi i humbjes së objektit të dashur dhe nga plaga narcisiste, për aq sa kjo dallohet nga plaga tjetër; për më tepër, nga ndjenjat e armiqësisë kundër rivalit të suksesshëm dhe nga një sasi më e madhe ose më e vogël autokritike e cila përpiqet ta mbajë egon e subjektit përgjegjëse për humbjen e tij.[65]

"Xhelozia, e kombinuar me faktorë psikologjikë, socialë dhe kulturorë, është një nga motivet kryesore në vrasjet e partnerit intim."Për ti dhënë përgjigje kësaj pyetje nevojitet ti referohemi disa shpjegimeve konkrete:

Shpjegimi psikologjik i xhelozisë vrasëse: *Xhelozia në këto raste nuk është emocion normal, por: a. Xhelozi patologjike (obsessive) që lidhet me: paranojë ("ajo po më tradhton" pa prova), kontroll ekstrem, shpesh shoqërohet me: çrregullime të personalitetit (antisocial, borderline), narcizëm. b. Ndjenja e pronësisë, "ajo është e imja", humbja e partneres = humbje e identitetit mashkullor dhe kur gruaja kërkon ndarje aktivizohet frika + turpi + humbja e kontrollit → agresion ekstrem. Xhelozia si "pasion i rrezikshëm." Sipas David M. Buss: xhelozia është një emocion i fuqishëm që mund të nxisë dhunë ekstreme.*[66]*Në analizën e tij, xhelozia bëhet problematike kur shndërrohet në: obsesion, kontroll dhe paranojë.*[67]*Donald G. Dutton argumenton se: dhunuesit kanë frikë të thellë braktisjeje dhe identitet të brishtë. Ndërsa, xhelozia aktivizon ankth → zemërim → aggression.*[68] *Sipas R. Emerson Dobash dhe Russell Dobash dhuna nuk është humbje kontrolli, por mënyrë për të ushtruar kontroll.*[69]*1. Teoria e xhelozisë patologjike, David Buss argumenton se: xhelozia është:"a dangerous passion capable of motivating violence".*[70]*2. Modeli psikodinamik, Donald Dutton:burrat që ushtrojnë dhunë kanë: frikë braktisjeje, identitet të brishtë, xhelozia → aktivizon: ankth + zemërim → dhunë.*[71]*3. Modeli i kontrollit (Dobash), R. Emerson Dobash dhe Russell Dobash:dhuna ndaj grave është:"a pattern of control, not loss of control".*[72]

Shpjegimi biologjik dhe evolucionar: *Teoria e pasigurisë së atësisë*, Burrat historikisht: nuk kanë siguri biologjike mbi atësinë. Kjo ka prodhuar: ndjeshmëri të lartë ndaj tradhtisë seksuale.[73]Studimet mbi agresionin tregojnë: Testosteroni → lidhet me dominimin dhe agresionin, Aktivizimi i amigdalës → reagime emocionale intensive (zemërim, frikë), kontroll i dobët i korteksit prefrontal → impulsivitet. Kombinimi: emocion i fortë + mungesë kontrolli → dhunë ekstreme.Teoritë evolucionare sugjerojnë se: burrat kanë zhvilluar ndjeshmëri ndaj tradhtisë seksuale. Sipas Martin Daly dhe Margo Wilson: vrasjet ndodhin shpesh në kontekstin e konflikteve romantike dhe xhelozisë.[74]Megjithatë: këto teori nuk janë deterministe dhe nuk justifikojnë dhunën.

Shpjegimi sociologjik (pse burrat vrasin nga xhelozia):*Patriarkalizmi dhe posedimi* - gruaja perceptohet si: "pronë", xhelozia = reagim ndaj humbjes së kontrollit. Daly & Wilson:*vrasjet ndodhin shpesh: gjatë konflikteve për marrëdhënien*.[75]*"Crimes of passion".*Historikisht shumë sisteme juridike e kanë konsideruar xhelozinë si rrethanë lehtësuese.[76]Sipas Richard Nisbett dhe Dov Cohen: në kulturat e nderit, reputacioni mashkullor lidhet me kontrollin mbi gruan dhe dhuna përdoret si mekanizëm për të ruajtur këtë reputacion.[77]

***Xhelozia në perspektivë historike*:** Historikisht, xhelozia ka qenë e lidhur ngushtë me kontrollin mbi gratë. Në shoqëritë patriarkale: gruaja konsiderohej pjesë e strukturës së pronësisë familjare dhe tradhtia interpretohej si shkelje e nderit mashkullor. Në kontekstin shqiptar, Kanuni i Lekë Dukagjinit institucionalizonte norma të forta mbi besnikërinë dhe nderin, duke krijuar një terren ku xhelozia mund të legjitimohej si reagim ndaj "turpit". Sipas R. Emerson Dobash dhe Russell Dobash: dhuna nuk është humbje kontrolli, por mënyrë për të ushtruar kontroll.[78]Në shoqëritë patriarkale: burri identifikohet me dominimin dhe gruaja me nënshtrimin. Xhelozia bëhet: - mekanizëm kontrolli; - reagim ndaj humbjes së pushtetit. Sipas Richard Nisbett dhe Dov Cohen: në kulturat e nderit, reputacioni mashkullor është thelbësor dhe dhuna përdoret për ta mbrojtur atë.[79]

5.1 Disa statistika në lidhje me vrasjet e e grave nga xhelozia e burrave

Sipas raportit të përbashkët të United Nations Office on Drugs and Crime dhe UN Women, 85,000 gra dhe vajza u vranë në botë në vitin 2023, ≈ 51,000 (60%) u vranë nga partnerët ose familjarët.[80] Kjo do të thotë: se 1 grua vritet çdo ~10 minuta. Një fakt shumë i rëndësishëm është se për burrat, vetëm rreth 10-12% e vrasjeve ndodhin brenda familjes, ndërsa për gratë, shumica e vrasjeve ndodhin brenda marrëdhënieve intime. Shtëpia dhe marrëdhënia intime është vendi më i rrezikshëm për gratë, jo rruga. Analiza krahasuese: ***≈*** *60% e grave të vrara janë viktima të partnerit/familjes* dhe vetëm ***≈*** *12% e burrave vriten në këto rrethana.* Kjo tregon një *asimetrie strukturore gjinore në vrasjet*.[81]Këto të dhëna tregojnë se hapësira familjare përbën rrezikun kryesor për gratë.[82]

Në Shqipëri tradita patriarkale dhe ndikimi i Kanunit kanë krijuar kontroll të fortë mbi rolin e gruas:

Legjislacioni penal e dënon dhunën në familje megjithatë rastet e femicidit vazhdojnë të lidhen me xhelozinë, ndarjen dhe kontrollin. Sipas të dhënave nga INSTAT dhe Policia e Shtetit, dhuna

në familje përbën *një nga veprat penale më të raportuara çdo vit.* Rreth *80-85% e viktimave janë gra.* Në shumë raste të vrasjeve të grave autori është bashkëshorti ose ish-partneri.[83]

Shumica e viktimave të dhunës në familje janë gra dhe në rastet e vrasjeve, autori është shpesh partneri. Në shumë raste evidentohet: - histori dhune; - xhelozi dhe kontroll; - ndarje ose konflikt për marrëdhënien.[84]Analiza e praktikës së Gjykata e Apelit të Juridiksionit të Përgjithshëm tregon modele të përsëritura: **-***Vrasja pas ndarjes:*Motiv: xhelozi + humbje kontrolli, kualifikim: vrasje e rënduar. - *Vrasja në ciklin e dhunës:*histori e dokumentuar dhune dhe xhelozi si instrument kontrolli. - *Vrasja pas dyshimeve për tradhti;* **-** shpesh pa prova: - refuzohet si "krim pasioni." **-** *Vrasja pas shkeljes së urdhrit të mbrojtjes;* **-** rrezikshmëri e lartë; dhe - dënim më i rëndë. **-** *Vrasja në konflikt të menjëhershëm:*por me tension të akumuluar; - refuzohet ulja e përgjegjësisë. Nga analiza rezulton se xhelozia shfaqet si: perceptim subjektiv, instrument kontrolli, dhe motiv i deklaruar, por në thelb ajo është pjesë e një sistemi dominimi dhe jo shkak autonom.

5.2 Analizë e vendimeve gjyqësore - Vrasjet e grave nga partnerët - modeli juridik dhe motivi i xhelozisë-

Analiza bazohet në: vendime të gjykatave të juridiksionit të përgjithshëm (2015-2024), vendime gjyqësore nga Gjykata e Apelit të Juridiksionit të Përgjithshëm,[85] raporte nga Policia e Shtetit, dhe të dhëna nga INSTAT.[86]Qasja është analizë cilësore (arsyetimi i gjykatës) dhe identifikim i modeleve të përsëritura. Nga praktika e gjykatave shqiptare (Gjykata e Shkallës së Parë dhe Apelit): - *Modeli tipik i çështjes:* Faktet kryesore: bashkëshorti vret gruan paraprihet nga: - konflikte të vazhdueshme; - dyshime për tradhti (shpesh të pabazuara); dhe kontroll dhe dhunë. Gjykata evidenton motivin e xhelozisë dhe ndarje:

Analizë e arsyetimit gjyqësor: Nga vendimet rezulton se gjykatat shqiptare përdorin disa linja kryesore arsyetimi: 1. *Xhelozia si motiv, jo justifikim.*2. *Paramendimi (element kyç).* 3. *Historia e dhunës.*Gjykatat i japin rëndësi: denoncimeve të mëparshme, urdhrave të mbrojtjes. *Problemet kryesore janë;* **-** Mosidentifikimi i hershëm i rrezikut; - Moszbatimi efektiv i urdhrave të mbrojtjes; - Nënvlerësimi i kërcënimeve.*Tendenca pozitive:* **-** Rritje e ndëshkimeve më të ashpra.

Nga praktika shqiptare dalin 3 modele kryesore të femicidit:*Modeli I: Vrasja pas ndarjes (më i shpeshti).Motivi:*xhelozi + humbje kontrolli. Konkluzion: vepra klasifikohet si: - *vrasje me dashje (e rënduar).Modeli II: Vrasja në kushtet e konfliktit të vazhdueshëm:Motivi:* - xhelozi obsessive dhe kontroll i vazhdueshëm. *Modeli III: Vrasja "impulsive" (më pak e shpeshtë):*Motivi: dyshim për tradhti. Por edhe këtu gjykata shpesh gjen tension të akumuluar më parë.

*Lidhja me xhelozinë.*Në praktikën shqiptare, xhelozia shfaqet në dy forma: 1. Xhelozi subjektive (perceptim), shpesh pa prova dhe lidhet me paranojë. 2. Xhelozi si instrument kontrolli, përdoret për të justifikuar izolimin dhe dhunën. Sipas United Nations Office on Drugs and Crime: Shqipëria ndjek të njëjtin model si vendet e tjera: femicidi ndodh brenda marrëdhënieve intime dhe xhelozia dhe ndarja janë faktorë kyç.[87]

Analizë e elementeve të përbashkëta:

1. Faktorë të përsëritur; - xhelozi patologjike; - kontroll i viktimës.

[83]INSTAT, Gra dhe Burra në Shqipëri (Tiranë, botimet vjetore 2021-2024), faqe 85-110. Policia e Shtetit, Raporte vjetore mbi kriminalitetin (2020-2023).
[84]Po aty.
[85]Prof. Asistent Dr. Bajram Ibraj "Dhuna në marrëdhëniet familjare dhe domosdoshmëria e sigurizimit të saj". 3. Vendimet e Gjykatës së Apelit të Juridiksionit të Përgjithshëm për dhunën në marrëdhëniet familjare në periudhën 06.04.2011 - 07.03.2024. https://orcid.org/0009-0006-1006-5379.
[86]Policia e Shtetit, Raportet vjetore mbi kriminalitetin, 2020-2023.
[87]UNODC, Global Study on Homicide (Vienna: United Nations, 2019), faqe 28-35.

2. Profili tipik i autorit; - mashkull partner/bashkëshort; - histori dhune; - dhe mungesë kontrolli emocional. *3. Profili i viktimës:* - grua në marrëdhënie abuzive; - shpesh ka kërkuar ndihmë më parë.[88]

Problemet në praktikën gjyqësore:

1. Parandalimi i pamjaftueshëm:

2. Nënvlerësimi i rrezikut:

3. Mungesa e analizës së rrezikut.[89]

*Krahasim me standardin ndërkombëtar:*Sipas United Nations Office on Drugs and Crime: modelet shqiptare janë identike me ato globale: femicidi ndodh në marrëdhënie intime. xhelozia dhe ndarja janë faktorë kyç.[90]

Nga analiza e jurisprudencës: Xhelozia shfaqet në tre nivele:

1. Si perceptim subjektiv; 2. Si instrument kontrolli; 3. Si justifikim i dhunës.[91]

Analizë e 5 rasteve gjyqësore[92]:

Rasti 1- *(Vrasje pas kërkesës për divorc - xhelozi dhe kontroll):1. Faktet.*I pandehuri (bashkëshorti) kishte ushtruar dhunë të vazhdueshme ndaj viktimës. Viktima kishte kërkuar divorc dhe ishte larguar nga banesa. Autori e kishte kërcënuar në mënyrë të përsëritur. Ngjarja ndodhi kur ai e priti dhe e goditi me mjet prerës, duke i shkaktuar vdekjen.*2. Çështja juridike:*A përbën vepra: vrasje me dashje e rënduar? A mund të konsiderohet xhelozia si rrethanë lehtësuese? *3.Arsyetimi i gjykatës:* Gjykata konstatoi:ekzistencën e një *konflikti të vazhdueshëm familjar; - paramendim,* pasi autori: kishte kërcënuar më parë *dhe*kishte pritur viktimën. Xhelozia u konsiderua: motiv subjektiv por *jo rrethanë lehtësuese. 4. Vendimi:*Dënim për: vrasje me dashje (e rënduar për marrëdhënie familjare); Dënim i lartë me burgim afatgjatë.

Rasti 2 - *(Vrasje në kushtet e dhunës së vazhdueshme).1. Faktet.*Viktima kishte denoncuar disa herë dhunën. I pandehuri shfaqte xhelozi ekstreme dhe kontrollonte lëvizjet e saj. Pas një konflikti për ndarje, ai e vrau në banesë.*2. Çështja juridike:*A duhet të merret parasysh historia e dhunës si element agravues? *3. Arsyetimi i gjykatës:*Gjykata theksoi, ekzistencën e një *cikli dhune të dokumentuar* dhe rrezikun e njohur paraprakisht. Xhelozia u interpretua si: *instrument kontrolli*, jo thjesht emocion. *4. Vendimi:*- vrasje në rrethana familjare; - Dënim i rëndë për shkak të përsëritjes së dhunës.

Rasti 3: *(Vrasje pas dyshimeve për tradhti). 1. Faktet:*I pandehuri dyshonte për tradhti (pa prova konkrete). Ai ushtronte kontroll të vazhdueshëm dhe kufizonte kontaktet e viktimës. Pas një konflikti verbal, e goditi për vdekje.*2. Çështja juridike:*A përbën kjo situatë "krim pasioni" me ulje përgjegjësie? *3. Arsyetimi i gjykatës:*Gjykata refuzoi: pretendimin për "gjendje emocionale të rënduar". Duke argumentuar, konflikti nuk ishte i menjëhershëm dhe kishte një *proces të gjatë tensioni dhe kontrolli. 4. Vendimi:* **-** Dënim për vrasje me dashje; - Pa rrethana lehtësuese.

Rasti 4- *(Vrasje pas shkeljes së urdhrit të mbrojtjes): 1. Faktet:*Viktima ishte pajisur me urdhër mbrojtjeje. I pandehuri e kishte shkelur disa herë këtë urdhër. Pas ndjekjes së vazhdueshme, ai e vrau.*2. Çështja juridike:*A përbën shkelja e urdhrit të mbrojtjes element agravues? *3. Arsyetimi i gjykatës:*Gjykata konstatoi se autori kishte *injoruar autoritetin shtetëror* dhe kishte treguar

[88]INSTAT, Gra dhe Burra në Shqipëri, 2021-2024.
[89]Policia e Shtetit, Raportet vjetore mbi kriminalitetin, 2020-2023.
[90]United Nations Office on Drugs and Crime, *Global Study on Homicide*, 2019, page 28-35.

[92]Po aty.

rrezikshmëri të lartë shoqërore. Xhelozia u lidh me obsesion dhe ndjekje. *4. Vendimi:*Dënim maksimal ose shumë i lartë. Theksim i rrezikshmërisë së lartë dhe mosrespektimit të ligjit.

Rasti 5 - *(Vrasje në konflikt të menjëhershëm- por me histori tensioni). 1. Faktet:*Ngjarja ndodhi gjatë një debati të menjëhershëm. Autori pretendoi se veproi në gjendje emocionale të rënduar. Megjithatë, rezultoi se kishte konflikte të mëparshme dhe xhelozi.*2. Çështja juridike;*A mund të zbatohet ulja e dënimit për gjendje emocionale? *3. Arsyetimi i gjykatës:*Gjykata vlerësoi ekzistencën e *tensionit të akumuluar* jo një reagim të papritur. Për rrjedhojë, nuk u pranua gjendja emocionale si shkak lehtësues. *4. Vendimi:* **-** Dënim për vrasje me dashje; - Refuzim i pretendimeve për ulje dënimi.

Analizë krahasuese e 5 rasteve: Nga këto raste dalin modele të qarta: *1. Elemente të përbashkëta;* - xhelozi e vazhdueshme; - kontroll i viktimës; - konflikte të mëparshme; - kërcënime paraprake. *2. Roli i xhelozisë në vendime:* Gjykatat shqiptare e pranojnë si: motiv faktik por e refuzojnë si justifikim juridik. *3. Tendencë e rëndësishme*. Eliminimi gradual i konceptit "krim pasioni". Dhe zëvendësimi me analizë të dhunës sistematike.[93]

Mbi bazën e çështjeve të trajtuara më sipër dhe analizës sëvendimeve gjyqësore -Vrasjet e grave nga partnerët-modeli juridik dhe motivi i xhelozisë-, arrijmë në disa përfundime dhe rekomandime.

Përfundime dhe Rekomandime

Punimi që në fillim trajtoj disa pyetje kërkimore dhe hipotezën e studimit: *Dhuna, në marrëdhëniet familjare dhe xhelozia nuk janë shkak i vetëm i vrasjeve në marrëdhënie intime, por një katalizator i fuqishëm i dhunës ekstreme*, dhe arrijmë në përfundimin që hipoteza është provuar dhe - Dhuna në marrëdhëniet familjare - Pse xhelozia e burrave vret? - është një bërë një problem i madh shqetësues për familjet dhe shoqërinë shqiptare.

1. Nga analiza e të dhënave rezulton se dhuna në marrëdhëniet familjare mbetet një problem serioz social me pasoja të gjera për individin, familjen dhe shoqërinë. Ajo paraqitet si fenomen kompleks ku ndërthuren faktorë psikologjikë, socialë dhe kulturorë, ndërsa xhelozia shfaqet kryesisht si katalizator i dhunës dhe jo si shkak i vetëm. Në këtë kuadër, patriarkalizmi mbetet një faktor strukturor, ndërsa femicidi rezulton si produkt i një cikli të vazhdueshëm dhune dhe kontrolli. Gjithashtu, vihet re një prirje në jurisprudencë për të zëvendësuar konceptin e "krimit të pasionit" me analizën e dhunës sistematike dhe të qëndrueshme.
2. Të dhënat ndërkombëtare dhe kombëtare tregojnë për një asimetri të qartë gjinore në vrasjet brenda marrëdhënieve intime. Sipas UNODC dhe UN Women, shumica e grave të vrara globalisht janë viktima të partnerëve ose familjarëve, ndërsa në Shqipëri raportet e INSTAT dhe Policisë së Shtetit tregojnë një model të ngjashëm. Këto statistika dëshmojnë se hapësira familjare mbetet një nga mjediset më të rrezikshme për gratë, ku rastet e femicidit lidhen shpesh me ndarje, konflikte të vazhdueshme dhe xhelozi ekstreme.
3. Nga analiza teorike dhe literaturës shkencore rezulton se xhelozia është një emocion kompleks që përfshin frikën nga humbja, pasigurinë dhe nevojën për kontroll. Në kushte të caktuara, ajo mund të shndërrohet në mekanizëm agresiv, veçanërisht kur bashkohet me obsesionin, perceptimin e pronësisë mbi partnerin dhe frikën nga braktisja. Në rastet e dhunës ekstreme, xhelozia manifestohet si kontroll i sjelljes së partnerit dhe si justifikim subjektiv i veprimeve agresive.

[93]Po aty.

4. Analiza e praktikës gjyqësore në Shqipëri evidenton modele të përsëritura në rastet e vrasjeve të grave nga partnerët, të cilat përfshijnë: vrasje pas ndarjes ose tentativës për divorc, vrasje në kushtet e një cikli të gjatë dhune dhe kontrolli, si dhe raste të konflikteve të menjëhershme që shpesh kanë një sfond të mëparshëm tensioni.
5. Gjetjet nga jurisprudenca tregojnë se xhelozia shfaqet kryesisht si motiv i deklaruar, por jo si rrethanë lehtësuese juridike. Gjykatat theksojnë elementët e kontrollit, paramendimit dhe historisë së dhunës, duke e trajtuar xhelozinë si pjesë të një modeli dominimi dhe jo si shkak të pavarur të veprës penale. Në këtë mënyrë, koncepti i "krimit të pasionit" po zëvendësohet gradualisht nga qasja që fokusohet në dhunën sistematike dhe të strukturuar.
6. Kuadri ligjor shqiptar, i përbërë nga Kodi Penal dhe Ligji për masa ndaj dhunës në marrëdhëniet familjare, e trajton dhunën në familje si vepër të veçantë penale dhe parashikon mekanizma mbrojtës për viktimat. Megjithatë, legjislacioni aktual nuk përdor termin "femicid", duke e trajtuar fenomenin në mënyrë të përgjithshme brenda kornizës së dhunës në familje.
7. Të dhënat empirike dhe teorike tregojnë se xhelozia e tepruar dhe sjelljet kontrolluese janë faktorë të rëndësishëm në ushtrimin e dhunës familjare. Megjithatë, ajo nuk vepron në mënyrë të izoluar, por në ndërveprim me faktorë psikologjikë, biologjikë dhe socialë. Femicidi, në këtë këndvështrim, nuk është akt i menjëhershëm, por rezultat i një procesi të gjatë kontrolli dhe dominimi.
8. Në përfundim, analiza e vendimeve gjyqësore tregon se xhelozia nuk është shkaku real i dhunës, por një element që shpesh përdoret për të justifikuar një strukturë më të gjerë dominimi. Në jurisprudencën bashkëkohore, ajo nuk trajtohet si faktor që ul përgjegjësinë penale, por si tregues i një marrëdhënieje të karakterizuar nga kontrolli dhe dhuna e vazhdueshme.

Mbi bazën e këtyre përfundimeve, rekomandohet:

1. Ndërhyrje e menjëhershme institucionale për parandalimin dhe minimizimin e dhunës në familje dhe parandalimit të vrasjes nga xhelozia nga burrat ndaj grave.
2. Vlerësim risku për viktimat në rrezik dhe shërbime rehabilituese për autorët.
3. Forcimi i zbatimit të urdhrave të mbrojtjes, përmes monitorimit real dhe ndërhyrjes së shpejtë institucionale.
4. Edukim për barazi gjinore, zhvillimi i programeve rehabilituese për autorët e dhunës, me fokus në menaxhimin e xhelozisë patologjike dhe kontrollit emocional.
5. Trajnim i vazhdueshëm i policisë, prokurorisë dhe gjyqësorit për identifikimin e hershëm të rrezikut në marrëdhënie abuzive.

Artificial Intelligence (AI) in accounting in Albania

MSc. Gladiola Kuka[1], Prof.Dr. Ylber Bezo[2]

[1,2]Faculty of Economy, Law and Social Sciences, University College of Business

Abstract

This study examines the use of Artificial Intelligence (AI) in accounting in Albania, focusing on its current level of adoption, influencing factors, and future potential. The rapid development of digital technologies has significantly transformed traditional accounting practices worldwide, shifting the profession from routine data processing toward analytical and strategic roles. However, in developing economies such as Albania, the integration of AI remains at an early stage.

The main research questions of this study are: To what extent is AI used in accounting in Albania? What factors influence its adoption? And how does AI impact the role of accounting professionals? The study employs a quantitative and qualitative research approach, based on data collected through a structured questionnaire distributed to accounting professionals. Descriptive and comparative analyses are used to interpret the findings.

The results indicate that while awareness of AI is increasing, its practical use is still limited and mainly focused on basic automation processes such as invoicing and reporting. Key barriers include lack of digital skills, high implementation costs, and resistance to change. Despite these challenges, respondents show a positive perception of AI and a willingness to adopt it in the future.

The study concludes that AI has strong potential to transform accounting in Albania by improving efficiency and supporting decision-making. It is recommended that greater investment in training, technology, and digital infrastructure be prioritized to accelerate adoption.

From Data to Intelligent Decision Making: The Power of Statistics in Artificial Intelligence

MSc. Albana Idershai[1], MSc. Dafina Dodoveci[2]

[1]*Senior, Statistics Expert*

[2]*Training and Communication, ASPA*

Abstract

In the context of digital transformation, Artificial Intelligence (AI) is being consolidated as an important tool in improving decision-making processes in various sectors.At the core of its functioning are data analysis and statistical methods, which enable the processing, interpretation, and extraction of results from large and complex volumes of information.

This article analyzes the undisputed role of statistics in the development and operationalization of AI systems, emphasizing its contribution in the phases of building, validating, and optimizing models. This study combines not only a descriptive analysis but also an analytical approach.

The study examines the interaction between statistical methods and algorithms as well as their applications in key areas such as health, public administration, and economics. The study also addresses not only the importance of using AI but also the main challenges that accompany this binomial, such as the quality of statistical data, interpretation of results, or data dynamics, etc.

The purpose of this article is to show the importance of using technological tools that today are not only developing at a rapid pace but also are being widely used in every socio-economic aspect of society.

Keywords: *Statistics, artificial intelligence, decision-making process, statistical models, public administration, data analysis.*

1. Hyrje

Transformimi digjital ka sjellë ndryshime të thella në mënyrën se si organizatat, institucionet dhe sektorët ekonomikë funksionojnë, analizojnë informacionin dhe marrin vendime. Rritja e vazhdueshme e volumit të të dhënave ka krijuar nevojën për metoda më të avancuara të mbledhjes, përpunimit, analizës dhe interpretimit të tyre. Në këtë kontekst, Inteligjenca Artificiale është shndërruar në një nga teknologjitë më të rëndësishme të kohës, pasi mundëson analizimin e sasive të mëdha të të dhënave dhe mbështet vendimmarrjen e bazuar në evidencë në sektorë të ndryshëm, si shëndetësia, administrata publike, arsimi dhe ekonomia (OECD, 2019). Zhvillimi i Inteligjencës Artificiale lidhet ngushtë me përpjekjet për të ndërtuar sisteme që imitojnë mënyrën se si njerëzit mendojnë, mësojnë dhe zgjidhin probleme. Një nga momentet më të rëndësishme në historinë e kësaj fushe është viti 1950, kur Alan Turing ngriti pyetjen nëse, Makinat mund të mendojnë? Më pas, në vitin 1956, John McCarthy përdori termin "Artificial Intelligence" për të përshkruar përpjekjet shkencore për krijimin e makinave inteligjente. Që nga ajo periudhë, Inteligjenca Artificiale ka kaluar nga një koncept teorik në një teknologji praktike me ndikim të madh në jetën shoqërore, ekonomike dhe institucionale.

Në themel të funksionimit të Inteligjencës Artificiale qëndron përpunimi i të dhënave. Sistemet inteligjente nuk mund të ndërtohen pa të dhëna të sakta, të strukturuara dhe të interpretueshme. Për këtë arsye, statistika luan një rol thelbësor në të gjitha fazat e zhvillimit të

këtyre sistemeve, duke filluar nga mbledhja dhe pastrimi i të dhënave, deri te ndërtimi, trajnimi, validimi dhe optimizimi i modeleve. Përmes metodave statistikore bëhet e mundur identifikimi i modeleve, zbulimi i lidhjeve ndërmjet variablave, kryerja e parashikimeve dhe nxjerrja e përfundimeve të vlefshme për vendimmarrje.

Rëndësia e të dhënave dhe statistikës bëhet edhe më e dukshme në epokën digjitale, ku informacioni prodhohet me ritme shumë të shpejta. Të dhënat përbëjnë burimin kryesor të njohurive, ndërsa statistika ofron metodat e nevojshme për t'i kthyer ato në informacion të dobishëm. Pa një bazë të qëndrueshme statistikore, modelet e Inteligjencës Artificiale do të kishin kufizime në saktësi, besueshmëri dhe efikasitet. Prandaj, përdorimi i teknikave statistikore është i domosdoshëm për zhvillimin e sistemeve inteligjente që prodhojnë rezultate të sakta dhe të verifikueshme.

Qëllimi i këtij punimi është të analizojë rolin e të dhënave dhe statistikës në funksionimin e Inteligjencës Artificiale, duke theksuar rëndësinë e tyre në ndërtimin e modeleve analitike dhe në përmirësimin e proceseve vendimmarrëse. Punimi synon të tregojë se të dhënat dhe statistika nuk janë vetëm instrumente teknike, por elemente themelore që mundësojnë transformimin e informacionit në njohuri dhe të njohurive në vendime inteligjente.

Rëndësia e të dhënave dhe statistikës në Inteligjencën Artificiale dhe vendimmarrje.

Të dhënat dhe statistika përbëjnë bazën themelore mbi të cilën ndërtohen sistemet moderne të analizës, parashikimit, Inteligjencës Artificiale dhe vendimmarrjes inteligjente. Në epokën digjitale, informacioni prodhohet me ritme shumë të larta nga individët, bizneset, institucionet publike, platformat digjitale dhe sistemet teknologjike. Kjo rritje e vazhdueshme e informacionit ka bërë që aftësia për të mbledhur, përpunuar, analizuar dhe interpretuar të dhënat të mos jetë më vetëm një proces teknik, por një kusht i domosdoshëm për funksionimin efektiv të institucioneve, organizatave dhe ekonomisë.

Të dhënat janë burimi kryesor mbi të cilin ndërtohet çdo analizë e besueshme. Ato përfaqësojnë fakte, tregues, matje dhe evidenca që ndihmojnë në kuptimin e realitetit ekonomik, social, teknologjik dhe institucional. Pa të dhëna të sakta, të strukturuara dhe të përditësuara, vendimmarrja mbështetet më shumë në perceptime, supozime ose përvoja të kufizuara. Në të kundërt, kur vendimet bazohen në të dhëna konkrete, ato bëhen më të argumentuara, më të matshme dhe më transparente.

Në sistemet e Inteligjencës Artificiale, të dhënat shërbejnë si lënda e parë mbi të cilën algoritmet trajnohen dhe nga e cila ato mësojnë. Një model i Inteligjencës Artificiale nuk mund të prodhojë rezultate të besueshme nëse nuk ushqehet me të dhëna cilësore. Sa më të sakta, të plota dhe të strukturuara të jenë të dhënat, aq më të qëndrueshme dhe më të dobishme janë rezultatet që prodhon modeli. Kjo tregon se cilësia e Inteligjencës Artificiale varet drejtpërdrejt nga cilësia e të dhënave mbi të cilat ajo ndërtohet.

Statistika ofron metodat dhe instrumentet që e kthejnë informacionin e papërpunuar në njohuri të vlefshme për vendimmarrje. Të dhënat, në vetvete, nuk mjaftojnë për të marrë vendime të drejta. Ato duhet të analizohen, të krahasohen, të interpretohen dhe të vendosen në kontekst. Përmes teknikave statistikore, si analiza e shpërndarjes, regresioni, probabiliteti, testimi i hipotezave dhe analiza e korrelacionit, bëhet e mundur identifikimi i modeleve, matja e marrëdhënieve midis variablave dhe nxjerrja e përfundimeve të argumentuara.

Në këtë mënyrë, statistika shërben si ura lidhëse midis të dhënave dhe vendimmarrjes. Ajo ndihmon që informacioni të mos mbetet thjesht një grumbull shifrash, por të kthehet në bazë për veprim. Në administratën publike, të dhënat statistikore ndihmojnë në identifikimin e

problemeve reale, në përcaktimin e prioriteteve dhe në vlerësimin e ndikimit të politikave. Në ekonomi, ato ndihmojnë në analizimin e trendeve të tregut, në parashikimin e riskut dhe në marrjen e vendimeve strategjike. Në shëndetësi, ato mund të përdoren për parashikimin e rreziqeve, analizën e diagnozave dhe përmirësimin e shërbimeve.

Rëndësia e të dhënave në vendimmarrje është veçanërisht e dukshme në sektorin publik. Institucionet nuk mund të hartojnë politika efektive pa njohur më parë gjendjen reale të popullsisë, ekonomisë, arsimit, punësimit apo shëndetësisë. Vendimmarrja e bazuar në të dhëna mundëson që politikat publike të jenë më të orientuara drejt nevojave konkrete të qytetarëve. Ajo gjithashtu ndihmon në monitorimin e rezultateve dhe në vlerësimin nëse një politikë ka qenë efektive apo jo.

Në rastin e Shqipërisë, të dhënat statistikore zyrtare, raportet zyrtare dhe publikimet institucionale përbëjnë burime të rëndësishme informacioni për analiza dhe vendimmarrje. Të dhënat e publikuara nga INSTAT dhe institucionet e tjera publike mund të përdoren për të analizuar zhvillimet në fusha si popullsia, arsimi, punësimi, ekonomia, çmimet, ndërmarrjet, teknologjia dhe administrata publike. Këto të dhëna shërbejnë si bazë për të kuptuar realitetin shqiptar dhe për të ndërtuar analiza më të sakta mbi nevojat dhe sfidat e vendit.

Në lidhje me Inteligjencën Artificiale, këto burime informacioni mund të përdoren për ndërtimin e modeleve që mbështesin vendimmarrjen. Të dhënat mbi punësimin dhe arsimin mund të përdoren për të analizuar lidhjen midis nivelit arsimor dhe përfshirjes në tregun e punës. Të dhënat mbi popullsinë mund të ndihmojnë në parashikimin e ndryshimeve demografike dhe nevojave për shërbime publike. Të dhënat ekonomike mund të përdoren për analizën e inflacionit, konsumit dhe zhvillimit të sektorëve të ndryshëm. Në këtë mënyrë, të dhënat statistikore nuk janë vetëm burim informacioni, por edhe bazë për vendime më të mençura dhe më të argumentuara.

Statistika luan rol vendimtar në ndërtimin, trajnimin, testimin dhe vlerësimin e modeleve të Inteligjencës Artificiale. Çdo model kalon nëpër disa faza, duke filluar nga mbledhja dhe pastrimi i të dhënave, deri te përzgjedhja e algoritmit, trajnimi i modelit dhe matja e performancës së tij. Në secilën nga këto faza, statistika ndihmon në identifikimin e gabimeve në të dhëna, në matjen e saktësisë së modelit, në shmangien e mbipërshtatjes dhe në interpretimin e rezultateve.

Vendimmarrja e mbështetur në Inteligjencën Artificiale kërkon jo vetëm modele të sakta, por edhe rezultate të kuptueshme dhe të shpjegueshme. Një vendim i marrë mbi bazën e një modeli inteligjent duhet të jetë i argumentuar, i verifikueshëm dhe i drejtë. Për këtë arsye, statistika ndihmon në rritjen e transparencës së vendimmarrjes, sepse ofron tregues të matshëm për saktësinë, besueshmërinë dhe kufizimet e modelit.

Burimet e informacionit kanë rëndësi thelbësore për cilësinë e analizës dhe vendimmarrjes. Nëse të dhënat vijnë nga burime të pasigurta, të pasakta ose jo të verifikueshme, atëherë edhe përfundimet e nxjerra prej tyre mund të jenë të gabuara. Për këtë arsye, në analiza statistikore dhe në zhvillimin e modeleve të Inteligjencës Artificiale, rëndësi të veçantë kanë të dhënat statistikore zyrtare, raportet shtetërore, publikimet institucionale, regjistrat administrativë dhe raportet e organizatave ndërkombëtare. Këto burime ofrojnë informacion më të strukturuar, më të dokumentuar dhe më të krahasueshëm, duke rritur besueshmërinë e analizës dhe cilësinë e vendimeve.

Lidhja midis të dhënave, statistikës, Inteligjencës Artificiale dhe vendimmarrjes nuk është vetëm teknike, por edhe metodologjike dhe etike. Modelet inteligjente nuk duhet të prodhojnë vetëm rezultate të shpejta, por rezultate të sakta, të shpjegueshme dhe të përgjegjshme. Përdorimi i të dhënave duhet të shoqërohet me kontroll të cilësisë, mbrojtje të privatësisë, shmangie të paragjykimeve dhe transparencë në interpretim.

Në këtë kuptim, statistika nuk është thjesht një mjet ndihmës për Inteligjencën Artificiale, por një nga shtyllat kryesore të saj dhe një instrument thelbësor për vendimmarrjen moderne. Ajo mundëson kalimin nga të dhënat e papërpunuara te informacioni i analizuar, nga informacioni te njohuria dhe nga njohuria te vendimi. Pa statistika, Inteligjenca Artificiale do të ishte një proces teknik me rezultate të vështira për t'u verifikuar. Me statistika, ajo bëhet më e matshme, më e kontrollueshme dhe më e përdorshme në sektorë të ndryshëm të jetës ekonomike dhe shoqërore.

Prandaj, mund të konkludohet se të dhënat dhe statistika nuk janë thjesht instrumente teknike, por komponentë strategjikë për zhvillimin e Inteligjencës Artificiale dhe për përmirësimin e vendimmarrjes. Ato sigurojnë bazën për ndërtimin e modeleve, garantojnë besueshmërinë e analizës dhe mbështesin vendime më të sakta, më transparente dhe më efektive. Në një shoqëri gjithnjë e më digjitale, aftësia për të përdorur të dhënat dhe statistikat në mënyrë të saktë përbën një nga kushtet kryesore për zhvillim, inovacion dhe qeverisje më të mirë.

2. Roli i Statistikës në Inteligjencën Artificiale.

Statistika përbën një nga bazat më të rëndësishme mbi të cilat ndërtohet dhe funksionon Inteligjenca Artificiale. Edhe pse AI shpesh lidhet me algoritme të avancuara, automatizim dhe kapacitete kompjuterike, në thelb të saj qëndron aftësia për të analizuar të dhënat, për të identifikuar modele dhe për të nxjerrë përfundime të vlefshme. Këto procese janë thellësisht të lidhura me metodat statistikore, të cilat i japin algoritmeve bazën teorike dhe praktike për të mësuar nga të dhënat.

Në Inteligjencën Artificiale, statistika nuk përdoret vetëm për të përshkruar të dhënat, por edhe për të ndihmuar në ndërtimin, validimin dhe optimizimin e modeleve. Ajo ndihmon në kuptimin e marrëdhënieve midis variablave, në matjen e pasigurisë, në vlerësimin e saktësisë së rezultateve dhe në interpretimin e vendimeve të prodhuara nga algoritmet. Për këtë arsye, mund të thuhet se statistika shërben si mekanizmi që e bën Inteligjencën Artificiale më të matshme, më të besueshme dhe më të përdorshme në vendimmarrje.

Nëse të dhënat janë lënda e parë e Inteligjencës Artificiale, statistika është metoda që i jep kuptim kësaj lënde. Pa metoda statistikore, algoritmet do të përpunonin të dhëna, por nuk do të ishte e qartë nëse rezultatet e tyre janë të sakta, të qëndrueshme apo të përgjithësueshme. Prandaj, roli i statistikës është thelbësor në çdo fazë të zhvillimit të një modeli inteligjent.

2.1 Ndërtimi i modeleve

Procesi i ndërtimit të modeleve të Inteligjencës Artificiale fillon me mbledhjen dhe përgatitjen e të dhënave. Kjo fazë është shumë e rëndësishme, sepse cilësia e modelit varet drejtpërdrejt nga cilësia e të dhënave mbi të cilat ai ndërtohet. Nëse të dhënat janë të paplota, të pasakta, të paorganizuara ose të njëanshme, edhe modeli i ndërtuar mbi to mund të prodhojë rezultate të gabuara. Për këtë arsye, përpara se të përdoren nga algoritmet, të dhënat duhet të pastrohen, të strukturohen dhe të transformohen në një format të përshtatshëm për analizë.

Në këtë fazë, statistika ndihmon në përshkrimin dhe kuptimin fillestar të të dhënave. Përmes analizës përshkruese, mund të identifikohen vlerat mesatare, shpërndarja e të dhënave, devijimet, vlerat ekstreme dhe lidhjet e mundshme midis variablave. Këto informacione janë të domosdoshme për të kuptuar natyrën e problemit dhe për të përcaktuar se cili model ose algoritëm është më i përshtatshëm për t'u përdorur.

Përzgjedhja e algoritmit nuk është një proces i rastësishëm. Ajo varet nga lloji i të dhënave, qëllimi i analizës dhe natyra e problemit që kërkohet të zgjidhet. Për shembull, nëse qëllimi

është parashikimi i një vlere numerike, mund të përdoren modele regresioni. Nëse synohet ndarja e rasteve në kategori të ndryshme, mund të përdoren algoritme klasifikimi. Nëse qëllimi është identifikimi i grupeve të ngjashme brenda të dhënave, mund të përdoren metoda të grupimit. Në të gjitha këto raste, statistika ndihmon në përcaktimin e strukturës së problemit dhe në zgjedhjen e metodës më të përshtatshme.

Një aspekt i rëndësishëm në ndërtimin e modeleve është identifikimi i marrëdhënieve midis variablave. Statistika ndihmon për të kuptuar nëse një ndryshore ndikon te një tjetër, nëse ekziston korrelacion midis tyre ose nëse marrëdhënia është e rastësishme. Kjo është e rëndësishme sepse modelet e Inteligjencës Artificiale nuk duhet vetëm të prodhojnë rezultate, por duhet të mbështeten mbi marrëdhënie të kuptueshme dhe të arsyeshme brenda të dhënave.

Në vendimmarrje, kjo fazë ka rëndësi të veçantë. Një model i ndërtuar mirë mund të ndihmojë institucionet, bizneset dhe organizatat të kuptojnë më mirë situatat që analizojnë. Për shembull, nëse përdoren të dhëna mbi punësimin, arsimin dhe moshën, një model mund të ndihmojë në identifikimin e faktorëve që ndikojnë në përfshirjen në tregun e punës. Nëse përdoren të dhëna ekonomike, modeli mund të ndihmojë në analizimin e prirjeve të konsumit, inflacionit ose zhvillimit të sektorëve të ndryshëm.

Pra, ndërtimi i modeleve nuk është vetëm një proces teknik, por një proces analitik që kërkon kuptim të të dhënave, përdorim të metodave statistikore dhe interpretim të kujdesshëm. Statistika e bën këtë proces më të kontrollueshëm dhe më të besueshëm, duke siguruar që modeli të ndërtohet mbi bazë të fortë metodologjike.

2.2 Validimi i modeleve

Validimi i modeleve është një fazë kritike në zhvillimin e Inteligjencës Artificiale, sepse përcakton nëse një model është vërtet i aftë të prodhojë rezultate të sakta dhe të besueshme. Një model mund të duket shumë i mirë gjatë fazës së trajnimit, por kjo nuk do të thotë se ai do të funksionojë mirë edhe me të dhëna të reja. Për këtë arsye, validimi është procesi që mat aftësinë e modelit për të përgjithësuar përtej të dhënave mbi të cilat është ndërtuar.

Në praktikë, të dhënat zakonisht ndahen në dy ose më shumë grupe. Një pjesë përdoret për trajnimin e modelit, ndërsa një pjesë tjetër përdoret për testimin e tij. Qëllimi i kësaj ndarjeje është të shihet nëse modeli ka mësuar marrëdhënie reale brenda të dhënave apo thjesht ka memorizuar shembujt e trajnimit. Nëse modeli jep rezultate të mira në të dhënat e trajnimit, por rezultate të dobëta në të dhënat e testimit, atëherë ai nuk është i përshtatshëm për përdorim në situata reale.

Një nga problemet më të rëndësishme që lidhet me validimin është mbipërshtatja. Mbipërshtatja ndodh kur modeli përshtatet në mënyrë të tepruar me të dhënat e trajnimit dhe humbet aftësinë për të përgjithësuar. Në këtë rast, modeli mund të kapë edhe zhurmën ose rastësitë e të dhënave, duke i trajtuar ato si marrëdhënie të rëndësishme. Kjo e bën modelin të pasaktë kur përballet me të dhëna të reja.

Nga ana tjetër, ekziston edhe problemi i nënpërshtatjes, kur modeli është shumë i thjeshtë dhe nuk arrin të kapë marrëdhëniet kryesore brenda të dhënave. Një model i tillë jep rezultate të dobëta si në të dhënat e trajnimit, ashtu edhe në ato të testimit. Statistika ndihmon në balancimin midis këtyre dy ekstremeve, duke matur gabimin, saktësinë dhe qëndrueshmërinë e modelit.

Treguesit e performancës janë pjesë thelbësore e validimit. Në varësi të llojit të problemit, mund të përdoren tregues të ndryshëm si saktësia, gabimi mesatar, ndjeshmëria, specifikueshmëria, matrica e konfuzionit ose tregues të tjerë statistikorë. Këta tregues ndihmojnë për të kuptuar jo

vetëm nëse modeli jep rezultate të mira, por edhe ku gabon dhe në çfarë kushtesh performanca e tij dobësohet.

Validimi ka rëndësi të drejtpërdrejtë për vendimmarrjen. Një model i pavlefshëm ose i patestuar mirë mund të çojë në vendime të gabuara. Në administratën publike, kjo mund të ndikojë në shpërndarjen e burimeve ose në hartimin e politikave. Në shëndetësi, mund të ndikojë në diagnoza ose vlerësime të riskut. Në ekonomi, mund të çojë në parashikime të pasakta dhe vendime të gabuara financiare. Për këtë arsye, validimi nuk është thjesht një hap teknik, por një kusht për besueshmërinë e vendimeve që mbështeten në Inteligjencën Artificiale. Në këtë kuptim, statistika shërben si mekanizëm kontrolli. Ajo ndihmon për të vlerësuar nëse modeli është i saktë, i qëndrueshëm dhe i përdorshëm në praktikë. Pa validim statistikor, rezultatet e Inteligjencës Artificiale do të ishin të vështira për t'u pranuar dhe për t'u përdorur në vendimmarrje të përgjegjshme.

2.3 Optimizimi i modeleve

Optimizimi i modeleve është faza që synon përmirësimin e performancës së Inteligjencës Artificiale pas ndërtimit dhe validimit fillestar. Qëllimi i optimizimit është që modeli të japë rezultate më të sakta, më të qëndrueshme dhe më efikase. Ky proces përfshin rregullimin e parametrave, përzgjedhjen e variablave më të rëndësishëm, reduktimin e gabimeve dhe përmirësimin e mënyrës se si modeli mëson nga të dhënat.

Në Inteligjencën Artificiale, modelet shpesh kanë parametra që ndikojnë në mënyrën se si ato mësojnë. Nëse këta parametra nuk janë të përshtatur mirë, modeli mund të jetë shumë i thjeshtë, shumë kompleks ose i paqëndrueshëm. Optimizimi ndihmon në gjetjen e kombinimit më të përshtatshëm të këtyre parametrave, në mënyrë që modeli të arrijë një balancë midis saktësisë dhe përgjithësimit.

Statistika ndihmon në këtë proces duke ofruar mjete për matjen dhe krahasimin e performancës. Përmes analizës së gabimit, krahasimit të modeleve dhe matjes së treguesve të performancës, mund të përcaktohet nëse një ndryshim në model ka sjellë përmirësim real apo vetëm një rezultat të rastësishëm. Kjo është e rëndësishme sepse një model nuk duhet të vlerësohet vetëm nga një rezultat i vetëm, por nga qëndrueshmëria e tij në kushte të ndryshme.

Një pjesë e rëndësishme e optimizimit është përzgjedhja e variablave. Jo çdo e dhënë që përfshihet në model është domosdoshmërisht e dobishme. Disa variabla mund të jenë të panevojshme, të përsëritura ose mund të krijojnë zhurmë në analizë. Statistika ndihmon në identifikimin e variablave që kanë ndikim më të madh në rezultat dhe në largimin e atyre që nuk kontribuojnë në mënyrë domethënëse. Kjo e bën modelin më të thjeshtë, më të shpjegueshëm dhe më efikas.

Optimizimi ka rëndësi të veçantë në vendimmarrje, sepse vendimet e mbështetura në AI kërkojnë modele të sakta, por edhe të kuptueshme. Një model shumë kompleks mund të japë rezultate të mira, por nëse nuk kuptohet mënyra se si arrin në ato rezultate, përdorimi i tij në vendimmarrje bëhet problematik. Prandaj, optimizimi nuk duhet të synojë vetëm rritjen e saktësisë, por edhe ruajtjen e interpretueshmërisë dhe transparencës.

Në sektorin publik, optimizimi i modeleve mund të ndihmojë në përmirësimin e analizave mbi nevojat e qytetarëve, shpërndarjen e burimeve dhe vlerësimin e politikave. Në ekonomi, mund të ndihmojë në parashikimin më të saktë të trendeve dhe riskut. Në shëndetësi, mund të përmirësojë saktësinë e modeleve diagnostikuese ose parashikuese. Në të gjitha këto raste, statistika siguron që përmirësimi i modelit të jetë i matshëm dhe i verifikueshëm.

Për këtë arsye, optimizimi nuk duhet parë si një proces përfundimtar, por si një proces i vazhdueshëm. Modelet e Inteligjencës Artificiale duhet të rishikohen dhe të përditësohen me

kalimin e kohës, sidomos kur ndryshojnë të dhënat, kushtet sociale, ekonomike ose teknologjike. Një model që funksionon mirë në një periudhë të caktuar mund të mos jetë po aq efektiv në një periudhë tjetër. Kjo e bën monitorimin dhe optimizimin statistikor një domosdoshmëri për përdorimin afatgjatë të AI.

Në përfundim, optimizimi i modeleve është procesi që e bën Inteligjencën Artificiale më të saktë, më efikase dhe më të përshtatshme për vendimmarrje. Statistika luan rol qendror në këtë fazë, sepse ndihmon në matjen e performancës, në reduktimin e gabimeve dhe në përmirësimin e besueshmërisë së rezultateve.

3. Ndërveprimi Statistikë – Algoritme AI

Të mësuarit automatik (Machine Learning) dhe statistika janë dy fusha të lidhura ngushtë, sepse të dyja merren me analizën e të dhënave, identifikimin e modeleve dhe nxjerrjen e parashikimeve. Të mësuarit automatik mund të shihet si një zgjerim praktik i metodave statistikore, pasi shumë algoritme të tij mbështeten në koncepte si probabiliteti, regresioni, inferenca statistikore dhe testimi i hipotezave.

Statistika fokusohet më shumë në kuptimin dhe interpretimin e marrëdhënieve midis variablave, ndërsa të mësuarit automatik synon kryesisht parashikimin dhe automatizimin e procesit të të mësuarit nga të dhënat.

Për këtë arsye, statistika i jep Inteligjencës Artificiale bazën teorike dhe metodologjike, ndërsa të mësuarit automatik e bën të mundur përdorimin e kësaj bazë në probleme komplekse dhe në sasi të mëdha të dhënash.

Ndërveprimi midis këtyre dy fushave është i rëndësishëm për ndërtimin e modeleve të sakta dhe të besueshme. Statistika ndihmon në kontrollin e cilësisë së të dhënave, në matjen e saktësisë së modelit dhe në interpretimin e rezultateve.

Të mësuarit automatik, nga ana tjetër, ndihmon në zbulimin e modeleve të fshehura dhe në krijimin e parashikimeve automatike. Në vendimmarrje, ky ndërveprim ka vlerë të veçantë, sepse modelet e AI nuk duhet vetëm të japin rezultate të shpejta, por edhe të jenë të kuptueshme dhe të verifikueshme. Për shembull, në ekonomi, administratë publike, arsim apo shëndetësi, statistika ndihmon në vlerësimin e besueshmërisë së parashikimeve, ndërsa të mësuarit automatik ndihmon në analizimin e të dhënave dhe identifikimin e prirjeve të ardhshme.

Statistika dhe të mësuarit automatik nuk duhet të shihen si fusha të ndara, por si pjesë plotësuese të Inteligjencës Artificiale. Statistika siguron bazën teorike dhe interpretimin, ndërsa të mësuarit automatik mundëson automatizimin dhe parashikimin. Së bashku, ato ndihmojnë në ndërtimin e modeleve më të sakta, më të qëndrueshme dhe më të dobishme për vendimmarrje inteligjente.

3.1 Saktësia, besueshmëria dhe interpretueshmëria

Në vlerësimin e modeleve të mësuarit automatik, tre elemente kryesore janë thelbësore: saktësia, besueshmëria dhe interpretueshmëria.

Saktësia (accuracy), i referohet aftësisë së modelit për të bërë parashikime të sakta mbi të dhëna të reja. Ajo matet shpesh përmes treguesve statistikorë që krahasojnë vlerat e parashikuara me ato reale.

Besueshmëria (reliability), lidhet me qëndrueshmërinë e modelit në kushte të ndryshme të të dhënave. Një model i besueshëm jep rezultate të ngjashme edhe kur të dhënat ndryshojnë brenda një intervali të caktuar.

Interpretueshmëria (interpretability), është aftësia për të kuptuar se si dhe pse një model arrin në një vendim të caktuar. Ky aspekt është veçanërisht i rëndësishëm në fusha si shëndetësia dhe administrata publike, ku vendimet duhet të jenë transparente dhe të justifikueshme.

Në këtë mënyrë, statistika luan rol themelor në balancimin midis performancës së lartë parashikuese dhe kuptueshmërisë së modeleve të Të mësuarit automatik, duke siguruar që rezultatet të jenë jo vetëm të sakta, por edhe të besueshme.

4. Metodologjia

Ky studim ndjek një qasje cilësore, përshkruese dhe analitike, e mbështetur në analizën e literaturës dhe në interpretimin konceptual të lidhjes midis statistikës, të dhënave, Inteligjencës Artificiale dhe vendimmarrjes. Kjo qasje është zgjedhur sepse tema nuk synon të testojë një model të caktuar empirik, por të shpjegojë rolin që statistika luan në funksionimin e sistemeve të Inteligjencës Artificiale dhe në përdorimin e tyre për vendime më të sakta dhe më të argumentuara.

Burimet e përdorura në këtë punim përfshijnë artikuj shkencorë, libra akademikë, raporte institucionale, të dhëna statistikore zyrtare dhe publikime të organizatave ndërkombëtare, si OECD, Bashkimi Evropian dhe Banka Botërore. Këto burime trajtojnë zhvillimin e Inteligjencës Artificiale, rëndësinë e statistikës në ndërtimin e modeleve, cilësinë e të dhënave dhe përdorimin e analizave statistikore në sektorë të ndryshëm.

Për rastin e Shqipërisë, si burime informacioni shërbejnë të dhënat statistikore zyrtare, raporte zyrtare dhe publikime institucionale, përfshirë të dhënat e publikuara nga INSTAT. Këto burime janë përdorur për të ilustruar mënyrën se si të dhënat e strukturuara dhe të besueshme mund të përdoren në analiza statistikore, në modele të Inteligjencës Artificiale dhe në mbështetje të vendimmarrjes së bazuar në evidencë.

Metoda kryesore e përdorur është analiza përshkruese dhe konceptuale. Analiza përshkruese është përdorur për të paraqitur rëndësinë e të dhënave dhe statistikës në proceset e Inteligjencës Artificiale, ndërsa analiza konceptuale për të shpjeguar lidhjen midis statistikës, algoritmeve, të mësuarit automatik dhe vendimmarrjes. Në këtë mënyrë, studimi synon të tregojë se statistika nuk është thjesht një instrument teknik, por një element themelor për ndërtimin, vlerësimin dhe interpretimin e modeleve inteligjente.

5. Aplikimet Kryesore dhe shtrirja e investimeve në AI.

Inteligjenca Artificiale, e mbështetur në statistika dhe analiza të të dhënave, ka gjetur aplikim të gjerë në fushat kryesore të shoqërisë dhe ekonomisë.

Në sektorin e shëndetësisë, AI përdoret për diagnostikim të hershëm të sëmundjeve, analizë të imazheve mjekësore dhe parashikim të rrezikut shëndetësor. Modelet statistikore ndihmojnë në identifikimin e modeleve klinike dhe në përmirësimin e saktësisë së diagnozave.

Në administratën publike, AI mbështet vendimmarrjen e bazuar në të dhëna, përmirëson ofrimin e shërbimeve publike dhe rrit efikasitetin institucional. Statistika përdoret për analizën e performancës, menaxhimin e burimeve dhe parashikimin e nevojave të qytetarëve. Sipas Bankës Botërore nevojitet hartimi i një kuadri rregullator ligjor i favorshëm me qellim prodhimin dhe përdorimin e të dhënave cilësore, që do të shërbejnë për një qeverisje të mirë. Madje edhe BE synon dhe mbështet të dhëna të harmonizuara jo vetëm për vendet anëtare por edhe për vendet kandidate për anëtarësim, ku një rol të rëndësishëm padyshim luan EUROSTAT nëpërmjet Sistemit Statistikor Europian (SSE), rregulloreve, Kodit të Praktikës për Statistikat Europian, Metodologjive, Udhëzimeve etj.

Në ekonomi, AI ndihmon në analizën e tregjeve, parashikimin e trendeve financiare dhe vlerësimin e rriskut. Metodat statistikore janë thelbësore për ndërtimin e modeleve ekonomike që mbështesin vendimmarrjen strategjike në sektorin publik dhe privat. Por, padyshim që AI sot përdoret kudo jo vetëm në analiza, parashikime apo procesin e vendimmarrjes por edhe në sektorë të tjerë prodhues apo ofrues shërbimesh gjithashtu.

Shumica e bizneset e reja (Start Up-eve) që operojnë në Shtetet e Bashkuara invesrojnë kapitalin e tyre fillesatar tek AI e cila vërehet jo vetëm nga numri i madh i transanksioneve që ato kryejnë por edhe nga shumat e investuara, të cilat përfaqësojnë dy të tretat e vlerës totale të investuar që nga viti 2011. Kina ka parë një rritje të jashtëzakonshme të investimeve në bizneset e reja të AI-së që nga viti 2016. Nga vetëm 3% në vitin 2015, kompanitë kineze tërhoqën 36% të investimeve globale në kapitalin privat të AI-së në vitin 2017. Bashkimi Evropian përbënte 8% të investimeve globale në kapitalin e AI-së në vitin 2017 duke treguar trend rritës krahasuar me 1% të këtij investimi në vitin 2013 ku bizneset e reja në Mbretërinë e Bashkuar morën 55% të investimeve totale të Bashkimit Evropian midis viteve 2011 dhe mesit të vitit 2018, të ndjekura nga sipërmarrjet gjermane me 14% dhe ato franceze me 13%. BE synon që AI-në ta impelmentojë gjithnjë e më shumë edhe tek NVM nëpërmjet Programit për Europën Dixhitale. Pikërisht nëpërmjet projektit InvestEU23, BE vuri në dispozicion një portofol prej 100 milion euro në AI dhe Blackchain.

6. Sfidat kryesore.

Përdorimi i Inteligjencës Artificiale në analizë dhe vendimmarrje ofron mundësi të mëdha, por njëkohësisht shoqërohet me sfida të rëndësishme. Këto sfida lidhen me cilësinë e të dhënave, interpretimin e rezultateve, kompleksitetin e modeleve, mbrojtjen e të dhënave personale dhe bazën ligjore që rregullon përdorimin e tyre. Për këtë arsye, Inteligjenca Artificiale nuk duhet parë vetëm si një instrument teknologjik, por si një proces që kërkon kontroll statistikor, transparencë dhe përgjegjshmëri në vendimmarrje.

Sfida kryesore është cilësia e të dhënave. Modelet e Inteligjencës Artificiale mësojnë nga të dhënat që u jepen, prandaj rezultatet e tyre varen drejtpërdrejt nga saktësia, plotësia dhe besueshmëria e këtyre të dhënave. Nëse të dhënat janë të paplota, të pasakta, të vjetruara ose të paragjykuara, modeli mund të prodhojë rezultate të gabuara dhe të ndikojë negativisht në vendimmarrje. Për këtë arsye, përpara përdorimit të të dhënave në modele inteligjente, ato duhet të kontrollohen, pastrohen, strukturohen dhe analizohen me metoda statistikore.

Një tjetër sfidë lidhet me interpretimin e rezultateve. Shumë modele të Inteligjencës Artificiale mund të japin rezultate të sakta nga ana teknike, por të vështira për t'u shpjeguar. Kjo krijon probleme sidomos në rastet kur rezultatet përdoren për vendime që ndikojnë te qytetarët, institucionet ose bizneset. Në fusha si administrata publike, shëndetësia, arsimi dhe ekonomia, nuk mjafton që një model të japë një përfundim; është e nevojshme të kuptohet pse modeli ka arritur në atë rezultat dhe cilët faktorë kanë ndikuar në vendimin e tij.

Kompleksiteti i modeleve përbën gjithashtu një sfidë të rëndësishme. Modelet e avancuara të Inteligjencës Artificiale përpunojnë sasi të mëdha të dhënash dhe përdorin struktura të ndërlikuara matematikore e kompjuterike. Kjo e bën të vështirë ndjekjen e procesit përmes të cilit modeli arrin në një përfundim. Sa më kompleks të jetë modeli, aq më e madhe është nevoja për metoda statistikore që matin performancën, saktësinë dhe kufizimet e tij. Në këtë drejtim, statistika ndihmon në kthimin e rezultateve teknike në informacion të kuptueshëm dhe të përdorshëm për vendimmarrje.

Dinamika e të dhënave ka. Në epokën digjitale, të dhënat ndryshojnë vazhdimisht në sasi, strukturë dhe përmbajtje. Një model që funksionon mirë në një periudhë të caktuar mund të mos japë të njëjtën saktësi në një periudhë tjetër, nëse ndryshojnë kushtet ekonomike, sociale,

teknologjike ose institucionale. Për këtë arsye, modelet e Inteligjencës Artificiale duhet të përditësohen, të testohen dhe të optimizohen vazhdimisht. Kjo është veçanërisht e rëndësishme për vendimmarrjen publike, ku vendimet duhet të mbështeten në të dhëna aktuale dhe të verifikueshme.

Në përdorimin e Inteligjencës Artificiale, një sfidë e rëndësishme lidhet edhe me paragjykimet në të dhëna dhe algoritme. Modelet inteligjente mësojnë nga të dhënat historike, por nëse këto të dhëna pasqyrojnë pabarazi, mungesa ose paragjykime ekzistuese, atëherë modeli mund t'i riprodhojë ose t'i forcojë ato. Kjo mund të sjellë vendime të padrejta, sidomos në fusha të ndjeshme si punësimi, arsimi, shëndetësia ose shërbimet publike. Për këtë arsye, kontrolli statistikor i të dhënave dhe vlerësimi i ndikimit të modelit janë të domosdoshëm për të garantuar vendimmarrje më të drejtë dhe më të përgjegjshme.

Një tjetër aspekt i rëndësishëm është mbrojtja e të dhënave personale dhe privatësia. Shumë sisteme të Inteligjencës Artificiale mund të përdorin të dhëna që lidhen drejtpërdrejt ose tërthorazi me individë. Për këtë arsye, përdorimi i AI në vendimmarrje duhet të respektojë parimet e mbrojtjes së të dhënave personale, sigurisë së informacionit dhe përdorimit të ligjshëm të të dhënave. Në rastin e Shqipërisë, kjo lidhet me kuadrin ligjor për mbrojtjen e të dhënave personale, ndërsa në nivel evropian me standardet që synojnë përdorimin e sigurt dhe të përgjegjshëm të Inteligjencës Artificiale.

Baza ligjore është një tjetër sfidë dhe njëkohësisht kusht i rëndësishëm për përdorimin e Inteligjencës Artificiale. Vendimmarrja e mbështetur në AI duhet të jetë në përputhje me ligjet për statistikat zyrtare, mbrojtjen e të dhënave personale, transparencën dhe përgjegjshmërinë institucionale. Në Shqipëri, të dhënat statistikore zyrtare rregullohen nga Ligji nr. 17/2018 "Për statistikat zyrtare", i cili përcakton parimet dhe organizimin e prodhimit të statistikave zyrtare. Kjo është e rëndësishme sepse vendimet publike duhet të bazohen në të dhëna të sakta, të standardizuara dhe të besueshme.

Në këtë kontekst, sfidat e Inteligjencës Artificiale nuk lidhen vetëm me teknologjinë, por edhe me mënyrën se si mblidhen, përpunohen, analizohen dhe përdoren të dhënat. Për të qenë e dobishme në vendimmarrje, AI duhet të mbështetet në të dhëna cilësore, në metoda statistikore të sakta, në interpretim të kujdesshëm dhe në respektim të kuadrit ligjor. Vetëm në këtë mënyrë mund të garantohet që rezultatet e modeleve të jenë të besueshme, transparente dhe të përdorshme në praktikë.

Pra, përfundimisht mund të themi se, sfidat kryesore të përdorimit të Inteligjencës Artificiale lidhen me cilësinë e të dhënave, shpjegueshmërinë e modeleve, paragjykimet algoritmike, privatësinë, përditësimin e vazhdueshëm të modeleve dhe respektimin e bazës rregullatore - ligjore. Përballimi i këtyre sfidave kërkon bashkëpunim midis ekspertëve të statistikës, teknologjisë, institucioneve publike dhe sigurisht nivelit vendimmarrës. Ndërsa statistika mbetet një element kyç në këtë proces, sepse ajo ndihmon në matjen e saktësisë, kontrollin e gabimeve dhe interpretimin e rezultateve që prodhon Inteligjenca Artificiale.

7. Diskutime.

Integrimi i statistikës me Inteligjencën Artificiale rrit cilësinë e vendimmarrjes së bazuar në evidencë, pasi mundëson që të dhënat të analizohen, interpretohen dhe përdoren në mënyrë më të saktë. Statistika siguron bazën metodologjike për vlerësimin e të dhënave dhe rezultateve, ndërsa Inteligjenca Artificiale ndihmon në përpunimin e shpejtë të informacionit dhe në identifikimin e prirjeve që mund të mbështesin vendimet në sektorë të ndryshëm.

Megjithatë, përdorimi i këtyre teknologjive kërkon disa kushte të rëndësishme: të dhëna cilësore, kapacitete profesionale, infrastrukturë teknologjike dhe kuadër ligjor të qartë. Këto

elemente janë të nevojshme për të garantuar që modelet e AI të jenë të sakta, të shpjegueshme dhe të përdorshme në mënyrë të përgjegjshme.

Në rastin e Shqipërisë, të dhënat statistikore zyrtare, raportet shtetërore dhe publikimet institucionale mund të shërbejnë si bazë për analiza më të besueshme dhe për vendimmarrje më të informuar. Për këtë arsye, përdorimi i statistikës dhe AI duhet të shoqërohet me standarde të qarta metodologjike, transparencë dhe kontroll të vazhdueshëm.

Statistika dhe Inteligjenca Artificiale plotësojnë njëra tjetrën. Statistika garanton saktësinë dhe interpretimin e rezultateve, ndërsa AI zgjeron mundësitë për analizë dhe parashikim.

8. Përfundime & Rekomandime

Përfundime

Statistika është një komponent thelbësor në zhvillimin dhe funksionimin e Inteligjencës Artificiale.

Ajo mundëson përpunimin, analizën dhe interpretimin e të dhënave.

Statistika ndihmon në ndërtimin e modeleve të AI, në testimin e tyre dhe në vlerësimin e performancës.

Pa një bazë të fortë statistikore, modelet e Inteligjencës Artificiale mund të jenë më pak të sakta, më pak të besueshme dhe për më tepër më të vështira për t'u interpretuar.

Integrimi i statistikës me AI përmirëson vendimmarrjen e bazuar në evidencë, sepse i kthen të dhënat në informacion të përdorshëm.

Në sektorë si administrata publike, ekonomia, arsimi dhe shëndetësia, përdorimi i statistikës dhe AI mund të ndihmojë në vendime më të sakta, më transparente dhe më efektive.

Në rastin e Shqipërisë, të dhënat statistikore zyrtare, raportet zyrtare dhe publikimet institucionale mund të shërbejnë si bazë e rëndësishme për analiza dhe vendimmarrje.

Rëndësia e statistikës pritet të rritet edhe më shumë në të ardhmen, për shkak të rritjes së kompleksitetit të të dhënave dhe zhvillimit të teknologjive të reja.

Rekomandime

Institucionet dhe organizatat duhet të investojnë më shumë në cilësinë e të dhënave.

Duhet të forcohen kapacitetet njerëzore në fushën e statistikës, analizës së të dhënave dhe Inteligjencës Artificiale.

Të dhënat e përdorura për modele AI duhet të jenë të sakta, të strukturuara, të përditësuara dhe të verifikueshme.

Modelet e Inteligjencës Artificiale duhet të jenë të kontrollueshme, të shpjegueshme dhe transparente.

Vendimmarrja e bazuar në AI duhet të mbështetet në burime të besueshme informacioni, si të dhëna statistikore zyrtare, raporte dhe publikime institucionale.

Duhet të forcohet kuadri rregullator - ligjor dhe etik për përdorimin e të dhënave dhe Inteligjencës Artificiale.

Përdorimi i AI duhet të shoqërohet gjithmonë me vlerësim statistikor, kontroll të cilësisë dhe interpretim të kujdesshëm të rezultateve.

Në të ardhmen, statistika duhet të trajtohet si një shtyllë kryesore për zhvillimin e sistemeve të besueshme, efikase dhe të përgjegjshme të Inteligjencës Artificiale.

Lista e shkurtimeve dhe termave

AI: Inteligjenca Artificiale

ML: Të mësuarit automatik

BE: Bashkimi Evropian

OECD: Organizata për Bashkëpunim dhe Zhvillim Ekonomik

INSTAT: Instituti i Statistikave

EUROSTAT: Instituti Europian i Statistikave

AI Act: Akti i Bashkimit Evropian për Inteligjencën Artificiale

GDPR: Rregullorja e Përgjithshme për Mbrojtjen e të Dhënave

Regresion: Metodë statistikore që përdoret për të analizuar marrëdhënien midis variablave

Mbipërshtatje: Gjendje kur modeli përshtatet tepër me të dhënat e trajnimit dhe jep rezultate më të dobëta në të dhëna të reja

Të dhëna statistikore zyrtare: Të dhëna të prodhuara nga institucionet publike sipas metodologjive statistikore të përcaktuara.

Adoptimi i Inteligjencës Artificiale në Arsimin Kontabël dhe Auditimit: Një Rishikim Kritik i Literaturës 2020–2026 dhe Implikime për Kontekstin e Ekonomive në Zhvillim

Dr. Andi Mehmeti[1], Dr (cand) Erjola Shehu[2]

1,2 Kolegji Universitar i Biznesit, Tiranë, Shqipëri

Abstrakt

Integrimi i shpejtë i Inteligjencës Artificiale (IA) në praktikën e kontabilitetit dhe auditimit po transformon thellësisht kërkesat për kompetenca profesionale, ndërkohë që literatura empirike mbetet e fragmentuar gjeografikisht, me mungesë të qartë të evidencës nga rajoni i Europës Juglindore. Qëllimi i këtij studimi është të sintetizojë gjetjet kryesore nga literatura empirike 2020–2026 mbi adoptimin e IA-s nga studentët e kontabilitetit dhe auditimit, duke identifikuar modelet konsistente ndërkontekstualisht dhe duke propozuar një agjendë kërkimore prioritare për ekonomitë në zhvillim. Metodologjia bazohet në rishikim kritik narracional të 15 studimeve empirike të publikuara ndërmjet 2020 dhe 2026, duke zbatuar Technology Acceptance Model (TAM) si kornizë teorike sintetizuese. Studimi kreu kërkim sistematik në Scopus, Web of Science dhe Google Scholar, me kritere të qarta përfshirjeje. Tre modele konsistente identifikohen: (1) hendeku awareness–knowledge, ku studentët njohin konceptin e IA-s por kanë njohuri të kufizuara sektoriale mbi aplikimet profesionale; (2) dominimi i Perceived Usefulness mbi Perceived Ease of Use si drejtues primar i Behavioral Intention — model 'utility-driven' që dëshmon motivim profesional strategjik; dhe (3) hendeku institucional, ku gatishmëria e lartë individuale e studentëve tejkalon konsistentisht mbështetjen kurrikulare institucionale. Punimi rekomandon reformë urgjente kurrikulare me fokus sektorial, partneritete publike-private dhe strategji kombëtare AI-arsim të bazuara mbi evidencë empirike lokale, veçanërisht për rajonin e Ballkanit Perëndimor.

Scientific Communication in the Past, Present, and the Digital-AI Era: Influence, Structures, Language, Integrity, and the Emerging Albanian Context

Dr. Renato Preza

Department of Applied Informatics in Economics,

Faculty of Informatics and Computer Sciences, Albania

E-mail: rpreza@kub.edu.al ; ORCID: 0000-0002-0613-7855

Abstract

Scientific communication has moved far beyond the traditional idea of publishing results in journals after research is completed. It now includes the full system through which scientific knowledge is produced, reviewed, circulated, indexed, interpreted, retrieved, and protected across academic, institutional, public, and digital environments. This paper examines scientific communication in three connected moments: its earlier print-centered and institutionally controlled form, its present digital and open-access condition, and its emerging transformation in the Digital-AI era. The analysis focuses on the changing role of journals, peer review, open access, metadata, repositories, preprints, and digital discoverability, while also addressing the growing importance of language, editorial integrity, and infrastructural trust. Special attention is given to the dominant role of English in global scientific circulation and to the unequal burdens this creates for non-native English-speaking researchers. The paper also analyzes the contemporary entrance of artificial intelligence into scientific communication through drafting, translation, summarization, screening, and editorial workflows, while stressing that responsibility for accuracy, attribution, and scholarly integrity remains human. A dedicated section examines the Albanian context as an emerging but still uneven environment of scientific communication, shaped by research strategy, digital policy, European integration, weak funding depth, incomplete research-data governance, and cyber-vulnerability. The paper argues that scientific communication is no longer only the transmission of findings. It is the broader system through which knowledge becomes visible, credible, reusable, and institutionally durable. Its present and future strength depends on balancing openness with trust, speed with validation, international reach with respect for local scientific origin, AI assistance with human accountability, and digital expansion with resilient infrastructure.

***Keywords**: Scientific communication; scholarly communication; open access; peer review; preprints; metadata; artificial intelligence; digital infrastructures; Albania.*

1. Introduction

Scientific communication stands at the center of modern science because knowledge does not become socially effective, academically durable, or institutionally recognized simply by being discovered. It becomes part of science when it is communicated in forms that can be reviewed, circulated, retrieved, cited, debated, and continued by others. This means that scientific communication is more than the final act of publishing results. It includes the wider chain through which research is written, evaluated, disseminated, indexed, preserved, and made visible across academic and public systems. Earlier models of scientific communication already described this field as a distributed process rather than a single publication event, and that understanding has become even more relevant in the present digital environment. (Björk, 2007); (Odlyzko, 2002).

The historical development of scientific communication shows a major structural shift. In its earlier dominant form, scientific communication was organized around print journals, editorial offices, learned societies, and institution-based libraries. Access was slower, more materially limited, and more strongly controlled by subscriptions, institutional holdings, and traditional gatekeeping structures. In the present environment, scientific communication has moved into a wider digital architecture shaped by journal platforms, repositories, preprints, indexing systems, persistent identifiers, and metadata-driven discoverability. UNESCO's open science framework reflects this transformation by placing accessibility, reuse, open infrastructures, and wider participation at the center of contemporary scientific practice. (UNESCO, 2021)

This transformation has expanded access, but it has also made scientific communication more demanding. Publication is no longer sufficient on its own. Research must also be visible across digital systems, linked to authors and institutions, discoverable in databases, and communicated through channels that are trusted. The growth of preprints, repositories, and platform-based dissemination has accelerated the circulation of knowledge, while the expansion of open access has changed the scale and speed at which research reaches readers. At the same time, these changes have intensified competition over legitimacy, editorial quality, indexing, metadata, and institutional visibility. Scientific communication is therefore no longer defined only by dissemination; it is also defined by credibility and infrastructural traceability. (UNESCO, 2021); (NIH Preprint Pilot, 2026); (French, 2026); (van Eck & Waltman, 2026).

Language is one of the strongest forces inside this system. English has become the dominant medium of international publication, conference exchange, collaboration, and scientific visibility. This dominance has clear practical value because it creates a common route for global circulation. It also creates inequality. Research shows that non-native English-speaking scientists spend more time on reading, writing, and presenting in English and often carry higher linguistic costs in the publication process. The role of English in science is therefore both enabling and unequal: it widens international reach while imposing additional burdens on many of the researchers expected to use it. A serious discussion of scientific communication must address both sides of that reality. (Amano, et al., 2023); (Doumont, 2010).

Artificial intelligence has introduced a new layer into this already changing environment. AI now appears in manuscript drafting, language refinement, summarization, translation, literature search support, screening, and editorial workflows. This development has increased speed and assistance, but it has also created new questions about attribution, disclosure, confidentiality, bias, hallucination, and scholarly responsibility. Current editorial standards are clear that AI may assist aspects of communication, but it cannot carry authorship or accountability. The updated committee, as per ICMJE (2026) added explicit guidance on AI in publishing, and major publishers have now formalized disclosure and confidentiality rules for AI-assisted work. Scientific communication in the Digital-AI era, therefore, requires not only technological adaptation but ethical and editorial discipline. (ICMJE, 2026); (Elsevier AI Journals, 2026).

These global developments do not unfold in the same way in every country. They take distinct forms inside national research systems, depending on policy frameworks, institutional capacity, funding, digital infrastructure, and international integration. Albania offers a particularly relevant case because it is moving more visibly into the contemporary communication environment of science while still facing structural limits. The country has adopted a National Strategy for Scientific Research, Technology, and Innovation 2023–2030, is participating in Horizon Europe, and has begun building research information infrastructure and AI-related policy frameworks. At the same time, European reporting continues to show gaps in implementation, research-data governance, funding depth, innovation performance, and institutional competitiveness. Albania, therefore, presents an emerging but still incomplete scientific communication environment. (Ministry of Education, 2026); (EU Commission, 2026).

The Albanian case also shows that scientific communication in the digital age depends on resilience as well as openness. Digital communication systems rely on trusted infrastructures, and those infrastructures can become targets of disruption. The 2022 cyberattacks attributed by Microsoft, CISA, and NATO-linked statements to Iranian state-sponsored actors exposed the fragility of national digital systems in Albania. This matters because scientific communication now depends not only on journals and scholars, but also on repositories, government-connected platforms, interoperable databases, digital records, and the security of the wider information environment. Communication without resilient infrastructure remains vulnerable. (Microsoft Threat Intelligence, 2022); (CISA, 2022).

This paper examines scientific communication across the past, the present, and the Digital-AI era by bringing together five main concerns: the historical shift from print to platform circulation; the expansion of open access, preprints, and discoverability; the growing competition around credibility, peer review, and indexing; the power and inequality of English in global scientific reach; and the emergence of AI as both a communicative tool and an integrity challenge. It also places these developments in the Albanian context, where research communication is becoming more visible, more digital, and more internationally connected, but is still constrained by structural weaknesses that slow full competitiveness. The central argument of the paper is that scientific communication is no longer only the transmission of findings. It is the full system through which knowledge becomes visible, validated, connected, reusable, and institutionally durable in a world shaped by digital infrastructures, linguistic asymmetries, AI-assisted workflows, and uneven national capacities.

2. Literature Review and Analytical Core

2.1 Conceptual clarification: what scientific communication is

Scientific communication is the process through which scientific knowledge is prepared, written, reviewed, published, shared, found, used, and preserved. It includes the writing of research, the presentation of findings, the circulation of results through journals and conferences, the storage of work in repositories and databases, and the systems that make research visible over time. Scientific communication is therefore more than writing a paper. It is the wider process through which science becomes known, trusted, cited, discussed, and continued by others. Classical models of scientific communication describe it as a distributed system rather than a single publishing act, and current infrastructures such as ORCID show that communication now also depends on persistent identity and metadata systems (Björk, 2007; ORCID, 2026).

Scientific communication is structured by at least three related but distinct domains. The first is scholarly communication. This is the circulation of research within the academic and professional research system through journals, peer review, repositories, conferences, preprints, citation systems, indexing services, and metadata infrastructures. The second is science communication in the broader public sense. This is the communication of scientific knowledge toward institutions, policy actors, media environments, and society beyond the specialist research community. The third is scientific writing and presentation. This is the practical communicative work done by researchers themselves: how they draft, structure, explain, visualize, summarize, defend, and present findings in forms that fit disciplinary standards and audience needs. These three domains overlap, but they are not the same. Each one performs a different function in the life of science (Björk, 2007).

This distinction matters because the transformation of science has never been limited to writing style alone. It has also involved publication systems, institutional channels, editorial filtering, public communication, digital discoverability, and long-term preservation. Research may be strong, but it does not become part of shared science unless it is communicated in forms that

others can recognize, evaluate, locate, and use. Scientific communication gives research social reach, institutional continuity, and scholarly legitimacy (Björk, 2007); (Odlyzko, 2002).

Scientific communication also has two sides that now work together. One side is intellectual: argument, evidence, method, explanation, and interpretation. The other side is infrastructural: identifiers, metadata, indexing, repositories, databases, archiving systems, and digital visibility. In the present environment, these two sides can no longer be separated. Research is communicated not only by what it says, but also by how it is described, linked, classified, and made discoverable across systems. Research communication is therefore both an intellectual and an infrastructural activity (French, 2026); (ORCiD, 2026); (van Eck & Waltman, 2026).

2.2 Scientific communication in the past: print, institutions, journals, and controlled circulation

The earlier dominant system of scientific communication was built around print journals, books, bulletins, editorial offices, learned societies, and institution-based libraries. Access to scientific work depended heavily on subscriptions, physical distribution, academic correspondence, and the authority of recognized journals and publishers. This gave scientific communication a slower rhythm and a more clearly bounded structure. Publication was materially scarce, circulation was geographically limited, and institutional affiliation strongly shaped access to knowledge (Odlyzko, 2002).

That earlier order had clear strengths. It imposed formal filters, linked publication closely to editorial authority, and made the journal a key site of scientific legitimacy. Journals did not simply distribute knowledge; they certified and organized it. Libraries did not simply store texts; they controlled access to the scientific record. Slower communication did not automatically mean weaker science. In many cases, it meant stronger visibility of editorial structures and clearer boundaries around what counted as part of the certified scholarly record (Björk, 2007).

The same system also had major limits. High subscription costs, uneven institutional access, slow circulation, and weak searchability made scientific exchange narrower and slower than it is today. Odlyzko's discussion of the future of scientific communication addressed exactly these tensions, especially the growing pressure created by cost, scale, and access barriers in the traditional journal system (Odlyzko, 2002).

Informal communication existed long before the digital era. Letters, seminars, working discussions, personal exchanges, and small research networks always accompanied formal publication. What changed later was the speed, scale, and visibility of these channels. Digital systems compressed the distance between formal publication, informal exchange, and public discoverability. Scientific communication has always been layered, but the present order has made those layers far more connected and immediate (Björk, 2007).

2.3 Scientific communication in the present: digital platforms, open access, preprints, discoverability, and sectoral communication

Scientific communication now operates in a much wider digital environment. Journals remain important, but they no longer stand alone as the only visible containers of scientific knowledge. Communication now moves through repositories, databases, preprint servers, identifier systems, metadata deposits, indexing services, and platform-based dissemination channels. In this setting, publication alone is no longer enough. Research must also be discoverable, linkable, reusable, and interoperable across digital systems. UNESCO's open science framework reflects this broader reality by emphasizing accessibility, reusability, open infrastructures, and wider scientific participation, not only access to final publications (UNESCO, 2021).

Open access has become one of the defining features of contemporary scientific communication. Its importance is not limited to reducing paywall barriers. It changes the logic of circulation itself by widening immediate access and enlarging the possible readership. STM's Open Access Dashboard shows how large this change has become: the share of global articles, reviews, and conference papers available through gold open access rose from 14% in 2014 to 40% in 2024, while subscription-only availability fell from 70% to 54%. Scientific communication is now more open than it was a decade ago, but that openness also creates new competition over visibility, quality, and trust (Seghers & Koers, 2026).

Preprints have added another major layer by allowing research to become publicly visible before journal certification is complete. The NIH Preprint Pilot makes this especially clear. The National Library of Medicine states that the pilot aims to increase the discoverability of early research results by making eligible preprints available through PubMed Central and PubMed. This means that scientific communication now often includes a public stage that comes before formal peer-reviewed publication. The result is faster circulation, but also a sharper need to distinguish between early dissemination and the certified scholarly record (NIH Preprint Pilot, 2026).

Discoverability has become a core condition of modern science. Research that is poorly indexed, weakly described, or inconsistently linked may formally exist, but still remain less visible and less useful. ORCID identifies itself as a persistent identifier system designed to create trustworthy connections between researchers, their contributions, and their affiliations. Crossref's discussion of author affiliation metadata adds another important point: incomplete metadata directly reduces visibility in downstream systems and institutional analyses. Scientific communication today depends not only on what is written, but also on how research is digitally described and connected (French, 2026; (ORCiD, 2026; van Eck & Waltman, 2026).

A stronger emphasis must also be placed on how science communicates to sectors. Science does not communicate only to scientists. It communicates to academic institutions through journals, repositories, teaching materials, and scholarly networks; to policymakers through reports, standards, evidence summaries, and regulatory guidance; to industry through innovation transfer, technical collaboration, and applied research outputs; to media through explanation, interpretation, and science reporting; and to society through education, health information, environmental communication, and digital public interfaces. In this broader sense, scientific communication is not only an internal scholarly process. It is also the route through which knowledge enters governance, education, innovation, and public life. UNESCO's framework explicitly connects scientific knowledge to accessibility, participation, and societal use (UNESCO, 2021).

Scientific communication has therefore moved from print circulation to platform circulation, and from relatively closed scholarly transfer to a wider model of sectoral communication. Research now travels not only through journals and libraries, but also through repositories, institutional systems, public platforms, policy channels, and collaborative networks. That broader movement makes science more visible and more usable, but it also makes communication quality more important than before (NIH Preprint Pilot, 2026; UNESCO, 2021).

2.4 Competition, credibility, and risk: peer review, publisher practice, indexing, and the problem of deceptive openness

The expansion of digital scientific communication has widened access, but it has also intensified competition over speed, legitimacy, visibility, and trust. Journals compete for submissions, publishers compete for prestige and market position, authors compete for discoverability and citation, and institutions compete for bibliometric presence and international recognition. In this environment, publication has value only when it takes place through channels that are transparent, well-governed, and trusted (Seghers & Koers, 2026).

Peer review remains central, but the simple claim that a journal is peer-reviewed is no longer sufficient. Editorial transparency, process clarity, review integrity, and governance practice have become part of communicative credibility itself. The DOAJ Principles of Transparency and Best Practice in Scholarly Publishing require journals to communicate core information clearly, including editorial processes and any deviations from best-practice standards. This makes editorial architecture part of the ethics of scientific communication (DOAJ, 2026).

This environment has also created a sharper distinction between genuine openness and deceptive openness. The problem is not open access itself. The problem is the existence of journals and publishers that imitate scholarly legitimacy while failing to provide the editorial and review functions they advertise. COPE identifies predatory publishing as a serious ethical problem that requires awareness and response. Scientific communication, therefore, depends not only on openness of access but on the ability to distinguish credible channels from opportunistic ones (COPE Council, 2019; DOAJ, 2026).

The contrast between credible and deceptive journals should not be reduced to a simple opposition between open and closed publishing models. Trusted open-access infrastructures remain central to modern science. The real divide lies between transparent and opaque editorial practice, between accountable and exploitative governance, and between publication systems that strengthen the scientific record and those that weaken it. Access without trust cannot sustain scholarly legitimacy (COPE Council, 2019); (DOAJ, 2026).

Indexing and metadata are now integral components of the competitive landscape in scholarly publishing. Journals and articles do not merely vie for publication; the significance of unique findings and compelling arguments is crucial. They compete for discoverability, institutional visibility, and presence within databases. Inadequate or poorly constructed metadata diminishes visibility in downstream systems. Publishing without robust indexing and metadata increasingly leads to weaker institutional mapping and reduced participation in the measurable advancements of science. Today, global competition plays a critical role in shaping the architecture of scientific credibility and digital traceability. (French, 2026); (van Eck & Waltman, 2026).

2.5 Language, English, and the politics of scientific reach

Language stands at the center of scientific communication because research does not circulate globally through evidence alone. It circulates through linguistic conventions, editorial expectations, conference norms, citation systems, and publication infrastructures that privilege certain routes of transmission. In the present scientific system, English occupies the dominant position – English as lingua franca. It functions as the main language of international publication, multinational collaboration, conference exchange, and transnational scholarly visibility. That gives English enormous communicative force, but it does not change the fact that scientific discovery often begins in local settings, local problems, local data, and local conceptual traditions before being reformulated for wider circulation, regionally and globally (Doumont, 2010; Suzina, 2021).

English has become the dominant language of scientific research because it allows communication across institutions, countries, and disciplines - English as the lingua franca (Suzina, 2021). It reduces fragmentation across publication spaces, supports multinational collaboration, and increases the likelihood that findings will move beyond national borders into larger scientific debates. At the same time, the same dominance creates structural inequality. A major study of environmental scientists found that non-native English speakers spent more time reading and writing papers in English, faced stronger editing burdens, and encountered barriers in conference participation and oral presentation. Some records highlight typical findings and

reveal data with meanings specific to a local language. While these findings provide clarity and a well-structured understanding, they must be translated into a language that does not convey the same sound, social context, geopolitical nuances, or individual local sentiments. Language inequality in science is therefore not only a personal inconvenience. It is a measurable cost built into the international publication system (Bowker & Amano, 2025). (Amano et al., 2023).

The inequality is also epistemic. When English becomes the near-exclusive route of prestige and recognition, scientific systems risk undervaluing work produced in other languages, even when that work is locally grounded and empirically important. Calls for more linguistically inclusive publishing policies argue that journals still do too little to lower language barriers. Scientific communication loses breadth when international visibility is treated as the only measure of intellectual value (Arenasc &Et al. 2024; (Suzina, 2021).

Technological change is now starting to modify this terrain. AI-mediated translation and language tools may reduce some of the communicative burdens placed on non-Anglophone researchers. The argument that AI may support a more multilingual future for scientific publishing is gaining strength, especially if these tools are used under transparent and responsible norms. These tools do not remove the dominance of English, but they do change the conditions under which researchers enter English-language publication systems (Bowker & Amano, 2025; Amano et al., 2023).

English continues to define the main route of international scientific circulation. At the same time, a stronger scientific communication system requires clearer recognition that local discovery retains intellectual priority even when English becomes the language of expansion. Scientific communication needs both realism about the force of English and greater respect for multilingual scientific origins (Amano et al., 2023; Doumont, 2010; Suzina, 2021).

2.6 Scientific communication in the Digital-AI era: assistance, disclosure, integrity, and editorial responsibility

Artificial intelligence has become an integral part of scientific communication, actively contributing to drafting and refining arguments, proposing revisions, offering structural suggestions, translating content, and uncovering elements not typically observed, all of which are shared across different regions of the world. It plays a significant role in manuscript preparation, language correction, summarization, literature searches, metadata generation, plagiarism detection, and journal triage. This evolution has altered the communicative landscape of science in two major ways: it has enhanced technical assistance and speed while also raising concerns about hallucination, transparency, attribution, confidentiality, and accountability. Consequently, prominent editorial organizations and publishers now regulate the use of AI more directly, rather than treating it as a peripheral issue (Elsevier AI Journals, 2026); (ICMJE, Use of Artificial Intelligence in Publishing, 2026; Springer Nature, 2026; Seghers & Koers, 2026).

At the author level, AI functions mainly as an assistive tool rather than an intellectual substitute. Current editorial guidance states that authors may use AI-assisted technologies to improve readability and language, but that the output must be checked carefully because AI can produce text that sounds authoritative while being incorrect, incomplete, or biased. Publishers also state that authors may use generative AI in manuscript preparation only with appropriate oversight and disclosure, while remaining fully responsible for accuracy, originality, and attribution. AI can support expression, but it does not carry responsibility for truth claims, evidence, methods, or scholarly judgment (Elsevier AI Journals, 2026) (ICMJE, Use of Artificial Intelligence in Publishing, 2026). Disclosure has therefore become a central issue of research integrity. Authors, editors, publishers, and reviewers are increasingly expected to be transparent when AI tools are used. STM's move toward a global reporting standard for AI disclosure in research

shows that undeclared AI use now affects the credibility of scientific communication itself. AI disclosure is becoming part of formal publication governance rather than an optional note (Seghers & Koers, 2026).

Authorship continues to represent a strict boundary. AI is unable to fulfill the responsibilities of an author, as it cannot ensure the integrity of a manuscript, approve the final version, manage conflicts of interest, or address criticism. Effective scientific communication relies not only on the dissemination of text but also on clear accountability for the claims and implications of that text. Thus, responsibility ultimately lies with human researchers, even when AI assists in drafting proposals based on available evidence or refining existing works. (ICMJE, Use of Artificial Intelligence in Publishing, 2026).

The stakes are significantly heightened in the processes of peer review and editorial management, as confidentiality is paramount. Publishers and editorial bodies emphasize that editors and reviewers must refrain from uploading submitted manuscripts to generative AI tools in ways that could compromise confidentiality or yield unreliable conclusions. Such tools often fail to reflect the author's structurally inherent elements necessary for addressing and computing solutions. Consequently, AI serves not only as a writing aid but also as a potential breach point in the protected chain through which scientific work is assessed prior to publication. (Elsevier AI Journals, 2026); (ICMJE, Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals, 2026); (Springer Nature, 2026).

AI also offers real communicative advantages. It can reduce linguistic burdens, speed drafting, assist summarization, support multilingual translation, and help researchers move through very large bodies of literature. These functions are especially relevant for non-native English-speaking researchers because AI-based language tools may lower part of the barrier created by English-dominant publishing norms. At the same time, AI can homogenize style, flatten disciplinary voice, reproduce bias, fabricate references, and create false confidence in weakly verified claims. Its benefits are real, but they do not remove the need for disciplined human supervision (Bowker & Amano, 2025); (Elsevier AI Journals, 2026).

The governing principle remains human accountability. Scientific communication has entered a phase of AI-assisted acceleration, but responsibility has not moved from the researcher, reviewer, or editor to the machine. AI now belongs inside scientific communication as a regulated and influential tool. The authority to validate, defend, interpret, and stand behind scientific work remains human (ICMJE, Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals, 2026).

2.7 The emerging Albanian context

2.7.1 Policy, strategy, and digital research infrastructure

Albania now has a more visible policy framework for research, technology, and innovation than in earlier years. The National Strategy for Scientific Research, Technology, and Innovation 2023–2030 (Ministry of Education, 2026), sets as a key goal the creation of an efficient and sustainable research-support system integrated at the international level, together with improved collection, processing, interpretation, and publication of indicators on research, technological development, and innovation. This places scientific communication inside a broader system of organization, measurement, and transmission (AKSHI, 2026).

The policy environment has also moved closer to research-information infrastructure and open-science logic. Albania's higher-education policy document states that the country is following European Commission developments on open science and has started efforts to preserve and use research data through ACRIS (Alimehmeti, 2023, pp. 8, lst prg), the Albanian Current

Research Information System. ACRIS matters because it concerns how researchers, institutions, projects, and outputs become visible, organized, and retrievable within a national system (S3Albania, 2025).

Artificial intelligence has also entered Albania's formal policy horizon. Public consultation on the draft National Artificial Intelligence Strategy of Albania 2025–2030 shows that AI has moved from a technical issue into formal state planning. Albania's scientific and institutional communication environment is therefore developing under a dual movement: wider digital organization of knowledge and greater policy attention to AI and cyber resilience (AKSHI, 2026).

2.7.2 Intellectual agencies and how scientific discoveries are communicated in Albania

Scientific discoveries in Albania are communicated through a distributed network of intellectual agencies rather than through a single route. Universities, research institutes, ministries, public agencies, journals, European programme channels, digital state platforms, project consortia, and quality-assurance structures all play roles in this circulation. Albania's research strategy itself links science with public institutions, innovation structures, business, and technology transfer, which broadens scientific communication beyond publication alone into a wider institutional ecology of coordination and use (Ministry of Education, 2026); (Alimehmeti, 2023).

This ecology is increasingly shaped by European research integration. Albania has participated in EU research and innovation programmes since 2008, and its Horizon Europe association agreement entered into force on 30 May 2022. European reporting also notes Albania's activity in the Widening programme and selected Horizon Europe clusters. Albanian scientific communication is therefore increasingly shaped by European network participation, transnational reporting, and cross-border research visibility (EU Commission, 2026); (EUR-Lex, 2022); (Alimehmeti, 2023).

Government communication has also become part of this wider digital environment. The e-Albania platform functions as a national digital interface through which public services are delivered electronically, while official state communication about Diella shows that AI has become publicly visible as a communication tool between institutions and citizens. This matters because scientific communication now develops inside a broader culture of digital mediation, guided access, and platform-based institutional interaction (Albanian Government, 2026); (AKSHI, 2026); (e-Albania, 2026).

2.7.3 Why Albania remains slow and not yet fully competitive

Albania remains slow, not because it lacks movement, ambition, or strategic language. It remains slow because implementation capacity, funding depth, research data governance, and international competitiveness do not yet move at the same pace as policy commitments. The 2025 Albania Report (DGEEN - EU, 2025), states that Albania still needs the legislation required for effective implementation of the 2023–2030 National Strategy on Scientific Research, Technology, and Innovation, and that it still needs to adopt research data management standards established by international organizations (AKSHI, 2026). A research system cannot compete strongly when strategy moves faster than implementing legislation and data standards (EU Commission, 2026).

Funding remains a major structural constraint. The same report records that Albania increased R&D funding in 2024 to 0.19% of GDP, but that this remains below the national target of 1% by 2030. It also states that more action is needed to increase public R&D funding, create incentives for business R&D expenditure, and improve cooperation between the private sector and universities. Underfunding weakens scientific communication at its source because it narrows

the research pipeline, reduces continuity, limits infrastructure, and leaves publication ambitions unsupported by a sufficiently strong production base (EU Commission, 2026); (Eurpean Commission, 2024).

Research information remains another bottleneck. The same report states that INSTAT still needs to produce a complete dataset on scientific research and innovation. In a digital environment, incomplete data weakens benchmarking, reduces visibility, complicates evaluation, and limits alignment with European research frameworks. This is one reason ACRIS matters so much: it is part of the effort to move scientific communication from fragmented registration toward a more coherent national information architecture. Where data remain incomplete, research may exist but remain institutionally underpowered and less visible than it should be (EU Commission, 2026).

Innovation performance shows the same pattern. Albania has entered the European research arena, but its entry has not yet become a strong competitive positioning. The country still performs below the average of comparable innovation groups and still requires greater private-sector participation in European research instruments. This means that policy ambition and actual research capacity remain unevenly matched (EU Commission, 2026); (EUR-Lex, 2022).

The bottleneck is therefore not the absence of strategic direction. The bottleneck is the conversion of strategy into stable research capacity. Albania has policy documents, digital ambitions, international access routes, and visible reform language. What it still lacks at a sufficient scale is synchronized implementation: stronger funding, mature data governance, deeper university-business cooperation, broader private participation in international programmes, and a more complete infrastructure for organizing and communicating scientific output. Without that synchronization, the communicative system remains active but structurally underpowered (EU Commission, 2026).

2.7.4 European integration, U.S. cyber-resilience influence, and external critical lenses

The European and American external lenses do not read Albania in the same way, and that difference is analytically useful. The European lens focuses on research integration, Horizon Europe participation, innovation performance, and alignment with European research and higher-education frameworks. It treats scientific communication as part of a wider process of integration into European knowledge infrastructures and research-governance systems (EU Commission, 2026).

The American and security-oriented lens appears more strongly through cyber resilience and defensive concern for digital infrastructure. This perspective becomes especially visible when Albania's digital future is discussed in terms of resilience, protection, and the hardening of the infrastructures on which communication depends. Contemporary scientific communication depends on both openness and resilience. Openness without resilient infrastructure leaves knowledge systems exposed. Security without communicative openness limits the circulation and integration of science (EUR-Lex, 2022); (NATO Statement, 2022); (Microsoft Threat Intelligence, 2022).

2.7.5 The Iranian cyberattacks and the fragility of digital scientific communication infrastructures

The cyberattacks against Albania belong in the analysis of scientific communication because digital science depends on stable and trusted infrastructures. Microsoft stated that it assessed with high confidence that actors sponsored by the Iranian government conducted the destructive cyberattack of 15 July 2022 against the Albanian government, disrupting

government websites and public services. CISA later reported another wave of Iranian cyber operations against the Government of Albania. NATO also declared solidarity with Albania and condemned the malicious cyber activities directed at its national information infrastructure (CISA, 2022); (Microsoft Threat Intelligence, 2022); (NATO Statement, 2022).

The significance of these attacks is structural. Scientific communication in the digital era depends on repositories, portals, interoperability systems, institutional databases, government-connected platforms, and stable channels for the circulation of documents, services, and public information. When national digital infrastructure is attacked, the vulnerability extends beyond administrative inconvenience. It reaches the wider ecosystem in which research information, institutional communication, and digitally mediated knowledge circulate. Albania's case shows that the future of scientific communication cannot be separated from cybersecurity and infrastructural resilience (CISA, 2022); (Microsoft Threat Intelligence, 2022).

Albania, therefore, presents a clear mixed picture. The movement toward digital and AI-mediated communication is real. So are the constraints: underfunding, incomplete data governance, uneven institutional capacity, limited competitiveness, and exposure to cyber disruption. Albania is an emerging context of scientific communication, but not yet a consolidated one (EU Commission, 2026); (DGEEN - EU, 2025).

3. Discussion

Scientific communication no longer begins only when a paper is accepted by a journal, and it no longer ends when that paper is published. It now unfolds across a wider chain that includes preprints, repositories, identifiers, metadata, indexing systems, open-access platforms, and later reuse by researchers, institutions, and publics. Open science has pushed knowledge toward broader accessibility and reuse, the NIH Preprint Pilot has formalized earlier discoverability of research outputs, and STM open-access data show that global scientific circulation has become substantially more open over the last decade. Scientific communication is now a continuing process of visibility, validation, circulation, and reuse rather than a single final publishing event (NIH Preprint Pilot, 2026); (Seghers & Koers, 2026); (UNESCO, 2021).

This wider circulation has increased reach, but it has also raised the value of trust. In earlier publication systems, credibility was attached more visibly to established journals, editorial offices, and institutional libraries. In the present system, credibility depends on a broader set of conditions: transparent editorial practice, real peer review, clear governance, reliable metadata, and discoverability in trusted infrastructures. Scientific communication is therefore more open than before, but it is also more dependent on the quality of the systems that organize and verify it (van Eck & Waltman, 2026); (COPE Council, 2019); (Fay, 2010); (French, 2026).

This leads to a central conclusion of the paper: the main divide in current scientific communication is not simply between open and closed publication. The deeper divide is between credible and non-credible communication channels. Open access has widened participation and removed barriers for many readers and researchers, but openness alone does not guarantee reliability. A journal may be free to read and still fail in review quality, governance, or transparency. A publisher may increase speed and still weaken the integrity of the scholarly record. Scientific communication now succeeds only when openness and credibility are built together (COPE Council, 2019); (DOAJ, 2026); (UNESCO, 2021).

Language remains one of the clearest examples of how communication can expand science while also limiting it. English has become the main language of international publication, collaboration, and conference exchange, which gives it enormous force in global science. At the same time, the costs of that dominance are measurable. Research shows that non-native English speakers spend more time on core scientific activities in English and face heavier burdens in writing and

presenting. A balanced view is therefore necessary: English remains the main route of international scientific circulation, but a stronger scientific communication system must protect the value of local discovery and reduce unnecessary linguistic inequality (Bowker & Amano, 2025) (Arenasc & Etl.,, 2024); (Doumont, 2010); (Suzina, 2021).

Artificial intelligence further sharpens this pattern of opportunity and risk. AI is key to drafting concepts structurally by the authors in detail and under given sets of conditions to process and approach, such as readability, translation, summarization, screening, computing, modeling, and navigation, to contrast with large literatures. For many researchers, especially non-native English speakers, this will reduce part of the communicative burden that has long shaped access to international publication. Current editorial rules unequivocally demonstrate that AI is not being accepted as an independent scholarly actor. AI is undoubtedly a valuable tool for scientific communication, but it should not and must not replace human responsibility for truth, judgment, attribution, review, and accountability. (Amano, et al., 2023); (Elsevier AI Journals, 2026); (ICMJE, Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals, 2026); (Springer Nature, 2026).

The Albanian case provides a tangible example of this discussion on a national level. Albania now demonstrates clear policy advancements in areas such as research, innovation, digital infrastructure, and AI strategy. Its national research plan emphasizes creating a more efficient, globally connected research support system, while its higher-education policies align with open-science initiatives and the development of ACRIS as a national research information platform. Additionally, Albania's involvement with Horizon Europe further illustrates its integration into the modern scientific communication landscape. These steps indicate that Albania is actively participating in contemporary science communication through policy initiatives, infrastructural improvements, and European collaboration. (EU Commission, 2026); (EUR-Lex, 2022); (Ministry of Education, 2026); (S3Albania, 2025).

At the same time, it is important to acknowledge the structural limitations faced by Albania. The country needs to enhance its implementation capacity, increase funding for research, improve governance of research data, strengthen collaboration between universities and businesses, and boost overall innovation performance. These are significant challenges that contribute to Albania's scientific communication environment being active yet not fully competitive. The issue does not stem from a lack of clear direction; rather, it arises from the incomplete translation of that direction into a stable capacity. (EU Commission, 2026)

The situation in Albania illustrates a complex dynamic in scientific communication within the digital era, which hinges not only on the principles of openness but also on the necessity for security. The landscape of communication in the country is currently influenced by two significant external pressures that are at play simultaneously. On one hand, there is the influence from Europe advocating for the integration of research, standardization of practices, participation in collaborative programs, and enhanced visibility within extensive knowledge-sharing infrastructures. On the other hand, there is a pressing need for bolstering cyber resilience and safeguarding digital systems, which stems from security concerns. This dual pressure highlights a critical lesson: effective scientific communication today relies not just on traditional elements such as academic journals, language proficiency, and various platforms. It also increasingly depends on the establishment of resilient infrastructures capable of maintaining their integrity and functionality, even in the face of significant challenges and threats. This evolving landscape underscores the importance of fostering environments that prioritize both accessibility and security in the realm of scientific discourse. (CISA, 2022); (Microsoft Threat Intelligence, 2022); (NATO Statement, 2022).

The discussion here, therefore, leads to one integrated view. Scientific communication in the past was more bound, slower, and more visibly controlled by institutions and journals. Scientific

communication in the present is faster, wider, more open, more searchable, and more dependent on digital infrastructures. Scientific communication in the Digital-AI era is also more exposed to new inequalities, new forms of editorial risk, new disclosure requirements, and new vulnerabilities linked to infrastructure and cyber disruption. The strongest future model is not the simplest or the fastest one. It is the model that can combine openness with trust, speed with validation, English-mediated reach with respect for multilingual origins, AI assistance with human accountability, and digital expansion with resilient public and research infrastructures.

4. Conclusion

Scientific communication has transitioned from a primarily print-based and institutionally restricted system to a broader digital landscape influenced by platforms, repositories, metadata, open access, and the earlier dissemination of research. The previous model was more reliant on journals, libraries, and slower editorial processes. The current model is focused on speed, discoverability, interoperability, and increased accessibility across interconnected infrastructures. Today, scientific communication encompasses not just publication, but also access, reuse, transparency, and greater involvement in the spread of knowledge (NIH Preprint Pilot, 2026); (UNESCO, 2021).

The ongoing transformation in scientific communication has intensified the necessity for robust quality control mechanisms. In today's more open and competitive landscape, credibility relies heavily on thorough peer review processes, transparent editorial practices, reliable indexing systems, and authentic metadata. Thus, the efficacy of scientific communication is not solely dependent on transparency; it is fundamentally rooted in the integration of openness, traceability, and institutional trust (COPE Council, 2019); (DOAJ, 2026); (French, 2026).

Language remains one of the strongest forces in this system. English continues to function as the main route of international scientific circulation, especially in journals, databases, conferences, and cross-border collaboration. Yet the dominance of English does not mean that science begins in English. Scientific discovery often begins in local realities, local institutions, and local conceptual worlds, then moves into English for wider transmission. A stronger scientific communication system must therefore preserve two truths at once: English remains the principal language of global reach, and local scientific origin remains intellectually primary (Amano, et al., 2023); (Doumont, 2010); (Fay, 2010); (Suzina, 2021).

The Digital-AI era has introduced a new dimension to this landscape. Artificial intelligence is now capable of assisting with drafting, translation, summarization, and navigating extensive bodies of literature. However, current editorial standards clarify that AI cannot assume authorship or responsibility. This underscores a fundamental principle of contemporary science: while AI can aid in communication, the responsibility for accuracy, integrity, attribution, and judgment resides solely with humans. (Amano, et al., 2023); (Elsevier AI Journals, 2026); (ICMJE, Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals, 2026); (Springer Nature, 2026).

The situation in Albania illustrates how these international transformations are manifesting within a developing research ecosystem. Albania is progressively integrating into European research networks and digital policy frameworks. However, the nation still requires enhanced execution of its research strategy, improved standards for research data management, increased investment in research and development, and a greater capacity for innovation. Consequently, while Albania is advancing, it has not yet achieved the pace necessary for complete competitiveness. (EU Commission, 2026); (EUR-Lex, 2022); (AKSHI, 2026).

Albania exemplifies how effective scientific communication in the digital age hinges not only on accessibility but also on resilience. It is crucial for government leaders to recognize and adopt a

comprehensive approach to cybersecurity, particularly in line with the strong recommendations from NATO allies. In today's landscape, research and institutional communication are increasingly dependent on digital platforms, which are often susceptible to disruptions and instability. Consequently, the future of scientific communication is inextricably linked to the robustness of digital governance, the reliability of technological infrastructure, and the implementation of stringent cybersecurity measures. (CISA, 2022); (Microsoft Threat Intelligence, 2022); (NATO Statement, 2022).

The conclusion is unmistakable. Scientific communication has evolved beyond merely publishing findings. It now encompasses a comprehensive system through which knowledge is validated, organized, circulated, indexed, interpreted, and protected. There is a strong emphasis on effectively transmitting this knowledge to actors, agencies, individuals, entities, and educational structures in research, ensuring that the value of this knowledge is preserved and continued. The future of scientific communication hinges on achieving a balance between openness and credibility, speed and validation, the global reach mediated by English and respect for multilingual origins, AI assistance and human accountability, as well as digital expansion and resilient infrastructures. This balance will ultimately define the true strength of science communication through the past, present, and into the Digital-AI era.

Ndikimi i kulturës lokale shqiptare në përvojën emocionale të turistëve ndërkombëtarë

Viliem Kurtulaj, PhD.[1], Enea Qose, Dr(cand)[2]

[1,2]*University College of Business, Albania*

**Corresponding Author: vkurtulaj@kub.edu.al*

Abstract

Ky studim analizon ndikimin e kulturës lokale shqiptare në përvojën emocionale të turistëve ndërkombëtarë. Duke u mbështetur në të dhëna empirike të mbledhura përmes një ankete të strukturuar me turistë që kanë vizituar destinacione të ndryshme në Shqipëri, kërkimi synon të identifikojë lidhjen midis elementeve të kulturës lokale si mikpritja, ushqimi tradicional, traditat dhe ndërveprimi me vendasit, dhe emocioneve të përjetuara gjatë qëndrimit. Të dhënat u analizuan përmes metodave statistikore. Rezultatet tregojnë një lidhje pozitive dhe statistikisht të rëndësishme midis përjetimit të kulturës lokale dhe emocioneve pozitive si kënaqësia, entuziazmi dhe ndjenja e autenticitetit. Veçanërisht, ndërveprimi me vendasit dhe perceptimi i autenticitetit kulturor rezultojnë faktorë kyç në formësimin e përvojës emocionale. Gjithashtu, gjetjet sugjerojnë se përvoja emocionale ndërmjetëson lidhjen midis kulturës lokale dhe dëshirës për rikthim, duke theksuar rëndësinë e dimensionit emocional në turizëm. Megjithatë, studimi evidenton edhe kufizime që lidhen me natyrën subjektive të matjes së emocioneve dhe mundësinë e paragjykimeve në përgjigjet e turistëve. Në përfundim, studimi ofron implikime praktike për zhvillimin e turizmit në Shqipëri, duke theksuar nevojën për ruajtjen e autenticitetit kulturor dhe përmirësimin e ndërveprimit midis turistëve dhe komuniteteve lokale.

***Keywords**: turizëm, kulturë, përvojë emocionale, Shqipëri.*

1. Introduction

Tourism has long been recognized as a powerful force in shaping cultural identity, economic development, and the symbolic construction of place. Yet the advent of digital media platforms has fundamentally altered the epistemology of tourism representation: travelers now function simultaneously as consumers and producers of cultural knowledge, disseminating travel experiences to global audiences through vlogs, short-form video, and social media storytelling. Within this transformed media landscape, travel vloggers have emerged as influential intermediaries in destination marketing, often shaping international perceptions with greater immediacy and affective resonance than conventional tourism promotion campaigns (Tussyadiah & Fesenmaier, 2009; Munar & Jacobsen, 2014).

Albania represents a particularly instructive case study within this context. Over the past decade, the country has undergone a dramatic repositioning in international tourism discourse, transitioning from a post-communist periphery largely absent from Western tourist itineraries to what digital media now frequently designate as "Europe's last hidden gem." This discursive transformation has been substantially driven by the circulation of international travel vlogs documenting experiences in Tirana, Berat, Gjirokastër, Shkodër, Sarandë, the Albanian Riviera, and the Albanian Alps. The volume and reach of this content have accelerated markedly since 2022, coinciding with post-pandemic travel recovery and growing audience appetite for non-mainstream destinations.

The increasing visibility of Albania through digital tourism content raises substantive questions about the representation and commercialization of local culture. Albanian traditions, cuisine, hospitality norms, architectural heritage, and everyday social practices are routinely transformed into legible, consumable tourism experiences calibrated for global audiences. This process instantiates what scholars of tourism anthropology have conceptualized as cultural commodification, the mechanism by which cultural elements acquire economic value through their incorporation into tourism markets (Greenwood, 1977; Cohen, 1988; Wang, 1999).

This paper aims to provide a rigorous critical analysis of how Albanian culture is represented and commodified in international travel vlogs. Specifically, the study pursues four interrelated objectives: (1) to identify dominant narrative and visual strategies through which vloggers construct Albanian cultural identity; (2) to determine which cultural elements are most frequently subject to commodification; (3) to examine how authenticity is discursively constructed within these digital tourism texts; and (4) to assess the implications of these representational practices for local communities, heritage sustainability, and destination brand equity.

2. Literature Review

2.1 Cultural Commodification in Tourism Contexts

The theoretical foundations of cultural commodification in tourism are most thoroughly elaborated in the work of Greenwood (1977), who documented how the commercialization of the Basque alarde ritual for tourist consumption drained it of authentic social meaning. Cohen (1988) subsequently refined this framework, arguing that commodification need not invariably destroy cultural meaning—that under certain conditions, commercialized cultural forms may undergo a process of "emergent authenticity" through which they acquire new social significance. This more nuanced position has been elaborated by subsequent scholars attentive to the agency of host communities in negotiating tourism encounters (Cole, 2007; Shepherd, 2002).

MacCannell's (1973) seminal concept of "staged authenticity" provides a complementary analytical lens: destinations strategically present culturally front-staged performances calibrated to satisfy tourist expectations of authenticity, while back-staged social reality remains largely inaccessible to the tourist gaze (Urry, 1990). In the context of digital tourism, these dynamics are further complicated by the participatory logic of platform media, wherein the boundaries between front and back stage are continuously renegotiated through user-generated content.

2.2 Digital Tourism and the Political Economy of Travel Vlogs

The emergence of social media as the primary architecture of tourism communication has generated a substantial body of scholarship examining how platforms such as YouTube, Instagram, and TikTok mediate destination image formation (Gretzel, 2018; Femenia-Serra & Neuhofer, 2018). Travel vlogs occupy a distinctive position within this ecosystem: their apparent informality, first-person narration, and embodied experiential register generate heightened perceptions of authenticity and trustworthiness compared with institutionally produced tourism marketing content (Tussyadiah & Fesenmaier, 2009).

However, this apparent authenticity conceals a complex political economy. Travel vloggers are embedded in platform incentive structures such as algorithmic visibility, monetization frameworks, and brand partnership arrangements that systematically reward certain representational strategies over others. Content emphasizing discovery, exoticism, affordability, and spectacularized hospitality consistently generates higher engagement metrics, creating

structural incentives for the reproduction of particular destination imaginaries irrespective of their fidelity to local social reality (Gretzel, 2018; Marwick, 2013).

2.3 Authenticity as a Constructed Tourism Resource

Authenticity in tourism is not a property inhering in objects or practices but a social construction negotiated between hosts, guests, and mediating institutions (Wang, 1999; Reisinger & Steiner, 2006). In emerging destinations such as Albania, perceived authenticity, often signified through markers of underdevelopment, pre-capitalist sociality, or resistance to mass tourism, functions as a strategic differentiator in an increasingly competitive global tourism market. Travel vloggers play a constitutive role in producing this authenticity effect: through selective framing, aesthetic choices, and narrative positioning, they construct the conditions under which certain encounters, foods, and landscapes register as genuinely authentic for viewer audiences.

2.4 Albania's Tourism Trajectory

Albania's emergence as an international tourism destination is inseparable from its digital media profile. International visitor arrivals increased from approximately 4.1 million in 2016 to over 7.5 million in 2023 (INSTAT, 2024), with digital influencer content widely credited as a driver of this growth. The country's tourism assets such as the Mediterranean coastline, UNESCO-designated historic centers at Berat and Gjirokastër, alpine landscapes, and a distinctive Ottoman-era culinary tradition are frequently framed in vlogs through the discursive register of European exceptionalism: a Mediterranean country with Balkan character, offering Western amenities at substantially lower costs. This positioning simultaneously reflects and reproduces structural inequalities in global tourism geographies.

3. Methodology

This study employs an interpretive qualitative research design grounded in critical content analysis (Krippendorff, 2004; Rose, 2012). A purposive sample of twenty-four English-language travel vlogs focused on Albanian tourism experiences was assembled from YouTube using a stratified selection protocol based on viewership (minimum 200,000 views), upload date (January 2022–December 2024), thematic coverage (urban, coastal, rural, and heritage contexts), and vlogger profile (independent creators, semi-professional travel channels, and mainstream media travel features). The sample includes vlogs with titles such as "First Time in Albania," "Albania: Europe's Best Kept Secret," "Eating My Way Through Tirana," "Albanian Villages You've Never Heard Of," and "Cheap Luxury on the Albanian Riviera."

Analysis proceeded through three iterative cycles of thematic coding informed by the constructivist grounded theory approach (Charmaz, 2006). The first cycle applied open coding to identify surface-level descriptive categories across the corpus; the second cycle applied focused coding to consolidate recurring narrative and visual patterns; and the third cycle applied theoretical coding to interpret these patterns in relation to the conceptual frameworks outlined above. Codes were applied to verbal narration transcripts, on-screen text, visual framing choices, editing conventions, and comment section interactions. The coding process generated five primary thematic categories, each analyzed in the findings section below.

4. Findings and Discussion

4.1 The "Undiscovered Paradise" Narrative Frame

The most pervasive discursive construct across the vlog corpus is the framing of Albania as an undiscovered, overlooked, or underrated European destination. Expressions such as "Europe's hidden gem," "the most underrated country in Europe," "an untouched paradise," and "the cheapest Mediterranean destination" appeared with high frequency across the sample. This framing performs several ideological functions simultaneously. At the level of content strategy, it positions the vlogger as an intrepid cultural discoverer, a figure whose cultural capital derives from accessing places before they enter mainstream tourism circuits. At the level of destination representation, it constructs Albania's relative underdevelopment as an asset rather than a condition to be overcome.

This narrative logic commodifies precisely those socioeconomic conditions such as limited tourist infrastructure, lower price levels, and reduced commercial density that are the product of historical marginalization within European political economies. The aesthetic of underdevelopment becomes, paradoxically, the object of a distinctly postmodern tourist desire. These dynamic echoes what Mowforth and Munt (2003) describe as the appropriation of "new" destinations by forms of alternative tourism that reproduce colonial structures of vision even as they claim to transcend them.

4.2 The Commodification of Hospitality

Albanian hospitality, including the traditional concept of besa, or unconditional guest-protection, and the broader cultural norm of generous hosting, emerged as the single most frequently represented cultural element across the corpus. Vloggers consistently documented and narrated encounters with what they described as "the most welcoming people in Europe": spontaneous invitations to family meals, gifts of food or accommodation from strangers, and expressions of pride and warmth toward foreign visitors. These encounters were systematically positioned as evidence of an authentic, pre-commercial sociality unavailable in more developed tourism destinations.

The representational strategy here warrants critical scrutiny. By iteratively circulating images of Albanian hospitality as an exceptional cultural commodity, vlog content generates what Hochschild (1983) might term an emotional labor demand: as tourism volumes increase and locals become aware of their hospitality's status as a tourism attraction, there arises structural pressure toward performative rather than spontaneous generosity. The commodification of hospitality risks transforming a genuine social norm into a managed tourism experience, precisely the dynamic that MacCannell's staged authenticity framework anticipates.

4.3 Gastronomic Tourism and the Aestheticization of Traditional Food

Traditional Albanian cuisine such as byrek, tavë kosi, fërgesë, grilled meats, fresh seafood, and local raki, etc., featured prominently across the corpus and constituted a major axis of destination differentiation. Vloggers consistently employed superlative registers to describe food quality and value, emphasizing the contrast between price levels and perceived quality as evidence of an undiscovered gastronomic destination. The visual and narrative treatment of food aligned closely with what Heldke (2003) terms "culinary tourism": the consumption of ethnic or traditional food as a form of cultural adventure and self-distinction.

This gastronomic gaze both elevates and simplifies Albanian culinary culture. While increased attention to traditional food preparation may support artisanal producers and restaurant

economies, the reduction of a complex, regionally differentiated culinary tradition to a repertoire of photogenic, vlogger-validated dishes risks producing a standardized "Albanian food" brand that serves tourism markets at the expense of culinary diversity.

4.4 Heritage Spectacle and the Visual Economy of Ruins

Historic urban environments, particularly the UNESCO World Heritage cities of Berat and Gjirokastër, and the archaeological site of Butrint, were consistently presented through an aesthetics of romantic ruin and preserved antiquity that foregrounds visual spectacle over historical depth. The Ottoman-era architecture of these cities was frequently described as "frozen in time" or "like stepping back into the Middle Ages", a temporal framing that denies the living, contemporary character of these communities and constructs heritage as a passive backdrop for tourist experience. This constitutes what Harrison (2013) describes as the authorized heritage discourse: a selective valorization of the material past that simultaneously occludes the social present.

4.5 Affordability as Ideological Frame

A fifth thematic cluster centers on the systematic foregrounding of Albania's price competitiveness as a core destination proposition. Vlogs regularly featured itemized cost breakdowns such as meals for two euros, accommodation at thirty euros per night, beach clubs at a fraction of comparable Mediterranean prices, accompanied by expressions of astonishment at the perceived disjuncture between quality and cost. While this framing serves audiences seeking practical travel information, it also constructs Albania's economic position as a source of tourist pleasure, effectively aestheticizing economic underdevelopment. These dynamics raise ethical questions about the representational responsibilities of influential content creators in relation to the communities they depict.

5. Conclusions and Implications

This paper has examined the mechanisms through which Albanian culture is represented and commodified in international travel vlogs, demonstrating that digital tourism content constitutes a significant site of cultural meaning-making with material consequences for destination development, heritage sustainability, and community wellbeing. The five thematic clusters identified-*the undiscovered paradise frame, the commodification of hospitality, gastronomic tourism, heritage spectacle, and the affordability ideology*- collectively produce a coherent but partial representation of Albanian cultural identity calibrated for global audience consumption.

These findings carry several implications for tourism practice and cultural policy. At the level of destination management, Albanian tourism authorities might productively engage with digital content creators to encourage more multidimensional representations of the country's cultural complexity. At the level of content creation, vloggers operating in emerging destinations bear a responsibility to reflect critically on the structural conditions shaping their representational choices. At the level of academic inquiry, this study contributes to a growing literature on digital tourism as a domain of cultural politics, suggesting the need for longitudinal research into the relationship between vlog-driven tourism growth and community-level experiences of commodification.

Future research might productively extend this analysis through audience reception studies examining how international viewers engage with Albanian tourism content, through ethnographic fieldwork with local communities navigating increased tourism exposure, and

through comparative analysis of destination commodification processes across the Western Balkans region.

Liritë Ekonomike Dhe Sfidat Ndaj Lirive Mjedisore: Një Analizë Kritike E Balancës Së Qëndrueshme

Dr. Gazmend Beshi

Kolegji Universitar i Biznesit

Abstrakt

Liritë ekonomike përbëjnë një shtyllë themelore të zhvillimit modern, duke nxitur rritjen ekonomike, inovacionin dhe mirëqenien e përgjithshme sociale. Megjithatë, zgjerimi i pakontrolluar i tyre shpesh gjeneron presione të konsiderueshme mbi mjedisin, duke çuar në shterimin e burimeve natyrore dhe degradimin e ekosistemeve. Ky punim synon të shqyrtojë marrëdhënien komplekse ndërmjet lirive ekonomike dhe lirive mjedisore, duke u fokusuar në tensionet strukturore ndërmjet zhvillimit të udhëhequr nga tregu dhe qëndrueshmërisë mjedisore. Studimi përdor një metodologji teorike dhe krahasimore, të mbështetur në analizën e praktikave ndërkombëtare dhe të kuadrove të politikave. Ai analizon mënyrën se si dështimet e tregut, veçanërisht externalitetet negative, kontribuojnë në degradimin mjedisor kur mekanizmat rregullues janë të dobët ose mungojnë. Njëkohësisht, theksohet se integrimi i parimeve të zhvillimit të qëndrueshëm dhe i qeverisjes mjedisore mund të krijojë një sistem ekonomik më të balancuar dhe më rezistent.

Gjetjet sugjerojnë se liritë ekonomike dhe ato mjedisore nuk janë në thelb të papajtueshme, por kërkojnë kuadro institucionale të projektuara me kujdes për të siguruar bashkëekzistencën e tyre. Politikat publike efektive, përfshirë taksimin mjedisor, standardet rregullatore dhe nxitjet për inovacion të gjelbër, luajnë një rol kyç në harmonizimin e aktivitetit ekonomik me mbrojtjen e mjedisit. Punimi përfundon se arritja e një balance të qëndrueshme kërkon veprim të koordinuar ndërmjet qeverive, tregjeve dhe institucioneve ndërkombëtare, duke vënë theksin në zhvillimin afatgjatë përkundrejt përfitimeve ekonomike afatshkurtra.

Fjalë kyçe: *liri ekonomike, qëndrueshmëri mjedisore, politika publike, ekonomi e gjelbër, rregullim*

1. Hyrje

Gjatë dekadave të fundit, zhvillimi ekonomik global është karakterizuar nga zgjerimi i lirive ekonomike, liberalizimi i tregjeve, rritja e investimeve ndërkombëtare dhe përparimi teknologjik. Këto procese kanë kontribuar në rritjen e prodhimit, uljen e varfërisë dhe përmirësimin e standardeve të jetesës në shumë vende të botës.

Megjithatë, përfitimet ekonomike janë shoqëruar edhe me pasoja të rëndësishme mjedisore. Ndryshimet klimatike, ndotja e ajrit dhe ujit, degradimi i tokës, shterimi i burimeve natyrore dhe humbja e biodiversitetit përfaqësojnë sfida globale që po kërcënojnë qëndrueshmërinë afatgjatë të zhvillimit njerëzor.

Në këtë kontekst, debati mbi marrëdhënien ndërmjet lirive ekonomike dhe mbrojtjes së mjedisit ka marrë rëndësi të veçantë. Disa studiues argumentojnë se tregjet e lira dhe rritja ekonomike krijojnë kushtet për investime në teknologji të pastra dhe përmirësim të cilësisë së mjedisit. Të tjerë theksojnë se mungesa e rregullimit adekuat çon në dështime të tregut dhe degradim të mjedisit.

Qëllimi i këtij punimi është të analizojë marrëdhënien ndërmjet lirive ekonomike dhe lirive mjedisore, duke identifikuar mekanizmat institucionalë dhe politikat publike që mundësojnë një zhvillim të qëndrueshëm.

2. Rishikimi i Literaturës dhe Kuadri Teorik

2.1 Koncepti i Lirive Ekonomike.

Liria ekonomike përkufizohet si e drejta e individëve dhe bizneseve për të marrë vendime ekonomike në mënyrë të lirë, brenda një kuadri institucional që garanton pronën private, kontratat dhe konkurrencën.

Sipas teorisë klasike ekonomike, liritë ekonomike përbëjnë bazën e zhvillimit ekonomik. Adam Smith argumentonte se tregjet funksionojnë në mënyrë efikase përmes mekanizmit të "dorës së padukshme", ndërsa Friedrich Hayek dhe Milton Friedman e konsideronin lirinë ekonomike si kusht themelor të lirisë individuale.

Dimensionet kryesore të lirisë ekonomike përfshijnë:

- Mbrojtjen e pronës private.
- Lirinë e investimit.
- Lirinë e tregtisë.
- Konkurrencën e lirë.
- Stabilitetin monetar.
- Efikasitetin rregullator.

2.2 Liritë Mjedisore dhe Zhvillimi i Qëndrueshëm.

Liritë mjedisore lidhen me të drejtën e individëve dhe komuniteteve për të jetuar në një mjedis të shëndetshëm dhe të sigurt.

Koncepti i zhvillimit të qëndrueshëm u formalizua nga Komisioni Brundtland në vitin 1987 dhe përkufizohet si zhvillim që plotëson nevojat e brezit aktual pa kompromentuar aftësinë e brezave të ardhshëm për të plotësuar nevojat e tyre.

Parimet kryesore të qëndrueshmërisë mjedisore përfshijnë:

- Ruajtjen e burimeve natyrore.
- Mbrojtjen e biodiversitetit.
- Uljen e ndotjes.
- Menaxhimin e ndryshimeve klimatike.
- Përdorimin racional të energjisë.

2.3 Dështimet e Tregut dhe Externalitetet Mjedisore.

Një nga problemet kryesore që lidh ekonominë me mjedisin është ekzistenca e externaliteteve negative.

Externalitetet negative lindin kur kostot e një aktiviteti ekonomik nuk përfshihen në çmimin e tregut dhe transferohen tek shoqëria.

Shembuj tipikë janë:

- Emetimet e gazeve serrë.
- Ndotja industriale.
- Deforestimi.
- Shfrytëzimi i tepërt i burimeve natyrore.

Sipas teorisë së Arthur Pigou, këto probleme mund të korrigjohen përmes taksave mjedisore dhe mekanizmave rregullatorë që detyrojnë subjektet ekonomike të përballojnë kostot reale të aktivitetit të tyre.

3. Metodologjia e Kërkimit

Ky studim mbështetet në një metodologji cilësore dhe krahasimore.

Metodat e përdorura përfshijnë:

- Analizën teorike të literaturës ekonomike dhe mjedisore.
- Analizën krahasimore të politikave publike.
- Shqyrtimin e praktikave ndërkombëtare.
- Analizën e dokumenteve të organizatave ndërkombëtare.
- Burimet kryesore të informacionit përfshijnë:
- OECD.
- World Bank.
- UNEP.
- United Nations.
- Raportet mbi ESG dhe ekonominë e gjelbër.

4. Rezultatet dhe Diskutimi

4.1 Liritë Ekonomike dhe Sfidat Mjedisore.

Analiza tregon se liritë ekonomike mund të prodhojnë si efekte pozitive ashtu edhe negative mbi mjedisin.

Efektet pozitive:

- Nxisin inovacionin teknologjik.
- Përmirësojnë efikasitetin e përdorimit të burimeve.
- Rrisin investimet në teknologji të pastra.
  Efektet negative:
- Rrisin konsumin e burimeve natyrore.
- Shtojnë ndotjen industriale.
- Përshpejtojnë degradimin e ekosistemeve.

Rezultatet tregojnë se ndikimi përfundimtar varet kryesisht nga cilësia e institucioneve dhe kuadrit rregullator.

4.2 Analiza Krahasuese Ndërkombëtare.

Përvoja ndërkombëtare demonstron se vendet me institucione të forta kanë arritur të kombinojnë suksesin ekonomik me mbrojtjen e mjedisit.

Vendi	Liria Ekonomike	Performanca Mjedisore
Suedia	Shumë e Lartë	Shumë e Lartë
Danimarka	Shumë e Lartë	Shumë e Lartë
Norvegjia	E Lartë	Shumë e Lartë
Gjermania	E Lartë	E Lartë
Kina	Mesatare	Mesatare
India	Mesatare	E Ulët

Vendet nordike përfaqësojnë shembullin më të suksesshëm të integrimit të lirive ekonomike me qëndrueshmërinë mjedisore.

4.3 Inovacioni i Gjelbër si Mekanizëm Balancues.

Inovacioni i gjelbër përfaqëson një nga mekanizmat më efektivë për harmonizimin e objektivave ekonomike dhe mjedisore.

Fushat kryesore të zhvillimit përfshijnë:

- Energjinë e rinovueshme.
- Ndërtimet e gjelbra.
- Transportin elektrik.
- Ekonominë qarkulluese.
- Teknologjitë e reduktimit të emetimeve.

Këto teknologji mundësojnë rritje ekonomike duke reduktuar njëkohësisht ndikimet negative mbi mjedisin.

4.4 Modeli i Balancës së Integruar të Lirive.

Kontributi kryesor i këtij punimi është propozimi i Modelit të Balancës së Integruar të Lirive.

Modeli mbështetet në katër shtylla:

Liritë Ekonomike.

- Investime.
- Sipërmarrje.
- Tregti e lirë.
- Konkurrencë.

Qeverisja Institucionale.

- Shteti ligjor.
- Transparenca.
- Efektiviteti rregullator.

Qëndrueshmëria Mjedisore.

- Mbrojtja e biodiversitetit.
- Kontrolli i ndotjes.
- Menaxhimi i burimeve natyrore.

Inovacioni i Gjelbër.

- Teknologjitë e pastra.
- Energjia e rinovueshme.
- Digjitalizimi.
- Ekonomia qarkulluese.

Ky model argumenton se zhvillimi i qëndrueshëm arrihet vetëm kur këto katër komponentë funksionojnë në mënyrë të integruar.

4.5 ESG si Urë Ndërmjet Ekonomisë dhe Mjedisit.

Në vitet e fundit, koncepti ESG (Environmental, Social and Governance) është shndërruar në një standard ndërkombëtar për vlerësimin e qëndrueshmërisë së organizatave.

Dimensioni mjedisor fokusohet në:

- Emetimet.
- Efikasitetin energjetik.
- Menaxhimin e mbetjeve.

Dimensioni social përfshin:

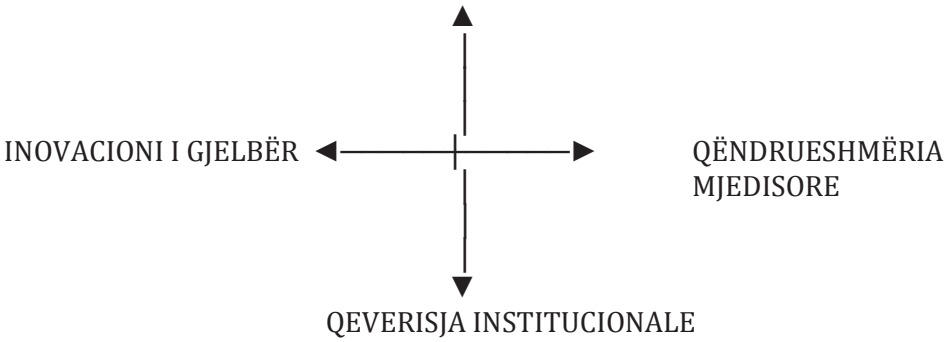
- Të drejtat e punëmarrësve.
- Përfshirjen sociale.
- Sigurinë në punë.

Dimensioni i qeverisjes lidhet me:

- Transparencën.
- Menaxhimin e riskut.
- Etikën korporative.

Praktikat ESG po konsiderohen gjithnjë e më shumë si instrumente kyçe për harmonizimin e objektivave ekonomike dhe mjedisore.

Figura 1. Modeli i Balancës së Integruar të Lirive.



Burimi: Përpunim i autorit.

Interpretimi i Modelit.

Modeli i Balancës së Integruar të Lirive argumenton se zhvillimi i qëndrueshëm mbështetet në ndërveprimin e katër komponentëve themelorë:

- **Liritë Ekonomike** – që nxisin sipërmarrjen, investimet, konkurrencën dhe rritjen ekonomike.
- **Qeverisja Institucionale** – që garanton sundimin e ligjit, transparencën, efikasitetin rregullator dhe zbatimin e politikave publike.
- **Qëndrueshmëria Mjedisore** – që siguron mbrojtjen e burimeve natyrore, biodiversitetit dhe cilësisë së mjedisit.
- **Inovacioni i Gjelbër** – që mundëson zhvillimin e teknologjive të pastra, energjisë së rinovueshme dhe ekonomisë qarkulluese.

Modeli thekson se këta katër komponentë funksionojnë si pjesë e një sistemi të integruar dhe të ndërvarur. Dobësimi i njërit prej tyre ndikon negativisht në performancën e të gjithë sistemit. Për shembull, mungesa e qeverisjes institucionale efektive mund të çojë në degradim mjedisor

dhe shtrembërim të tregut, ndërsa mungesa e inovacionit të gjelbër kufizon aftësinë e ekonomisë për të zhvilluar modele të qëndrueshme të rritjes.

Për rrjedhojë, arritja e një balance të qëndrueshme ndërmjet zhvillimit ekonomik dhe mbrojtjes së mjedisit kërkon forcimin e njëkohshëm të lirive ekonomike, institucioneve, inovacionit dhe politikave mjedisore. Kjo qasje përbën bazën teorike të **Modelit të Balancës së Integruar të Lirive (MBIL)**, i propozuar në këtë studim.

4.6 Implikimet për Shqipërinë dhe Ballkanin Perëndimor.

Shqipëria përballet me sfida të shumta në fushën e zhvillimit të qëndrueshëm.
Ndër sfidat kryesore përfshihen:

- Menaxhimi i mbetjeve.
- Ndotja urbane.
- Urbanizimi i pakontrolluar.
- Efikasiteti energjetik relativisht i ulët.

Megjithatë, vendi disponon potencial të konsiderueshëm në:

- Energjinë hidrike.
- Energjinë diellore.
- Turizmin e qëndrueshëm.
- Digjitalizimin e administratës publike.

Procesi i integrimit evropian ofron një mundësi të rëndësishme për forcimin e institucioneve dhe implementimin e politikave të gjelbra.

5. Rekomandime

Bazuar në rezultatet e studimit rekomandohen:

1. Zbatimi gradual i taksimit të karbonit.
2. Mbështetja fiskale për investimet e gjelbra.
3. Integrimi i standardeve ESG në sektorin privat.
4. Forcimi i monitorimit mjedisor.
5. Nxitja e kërkimit shkencor dhe inovacionit.
6. Zhvillimi i tregjeve të energjisë së pastër.
7. Rritja e edukimit për zhvillim të qëndrueshëm.

6. Përfundime

Ky studim konfirmon se liritë ekonomike dhe liritë mjedisore nuk janë në thelb të papajtueshme. Konflikti ndërmjet tyre lind kryesisht si rezultat i dështimeve të tregut, mungesës së institucioneve efektive dhe politikave të pamjaftueshme rregullatore.

Përvoja ndërkombëtare tregon se vendet me qeverisje të mirë, institucione të forta dhe orientim drejt inovacionit të gjelbër kanë arritur të sigurojnë njëkohësisht rritje ekonomike dhe mbrojtje mjedisore. Në këtë kuadër, zhvillimi i qëndrueshëm duhet të konsiderohet jo si kufizim i lirive ekonomike, por si mekanizëm që garanton vazhdimësinë e tyre në afat të gjatë.

Modeli i propozuar i Balancës së Integruar të Lirive ofron një qasje konceptuale për harmonizimin e objektivave ekonomike dhe mjedisore, duke vendosur në qendër institucionet, inovacionin dhe qeverisjen e qëndrueshme. Për Shqipërinë dhe vendet e Ballkanit Perëndimor, ky model mund të shërbejë si bazë për hartimin e politikave publike që mbështesin tranzicionin drejt një ekonomie më konkurruese, më të gjelbër dhe më të qëndrueshme.

Digital Transformation and Artificial Intelligence: The Impact on Human Resource Motivation in Enterprises

Dr. Lindita Cenaj

University College of Business, Tirana, Albania

Email: lcenaj@kub.edu.al

Abstract

Digital transformation and the application of Artificial Intelligence (AI) are having a profound impact on human resource motivation. The study is based on a comparison between small and medium-sized enterprises in Albania and Bulgaria. The main research question focuses on how the integration of digital processes modifies the need for both monetary and non-monetary motivation in different cultural and economic environments.

The applied scientific methodology is based on the methods of analysis and synthesis, as well as empirical research through surveys of employees and managers in both countries, using statistical tools for processing data collected during the period 2021–2023. The findings suggest that while digital transformation increases operational efficiency, it requires a shift toward competence-based motivation and continuous professional development to avoid resistance to change.

The main results show a positive correlation between readiness for innovation and employee engagement when technology is perceived as supportive of human capital growth. The recommendations emphasize the need for a strong organizational philosophy that integrates artificial intelligence with employee well-being, suggesting the improvement of motivational policies through a competence-based approach to ensure sustainable development of enterprises in the digital era.

Keywords: Motivation, Artificial Intelligence, Digital Transformation, SMEs, Competencies.
JEL: O33, M12, M54.

1. Introduction

1.1. The Context of Change:

From Traditional Optimization to Digital Synergy.

In the last decade, operations and human resources (HR) management has undergone a radical metamorphosis, shifting from a purely administrative and support function to an essential and strategic factor for organizational survival. In the era of Industry 4.0, Digital Transformation and Artificial Intelligence (AI) are no longer perceived as innovative luxury options, but as non-negotiable conditions for maintaining a competitive advantage. However, while classical management literature emphasized process optimization, capacity planning, and value chain efficiency, today's business environment highlights a new reality: the main obstacle or catalyst of this transition is not the technological infrastructure, but the human factor.

1.2. The Challenge of the New Paradigm:

Motivation in the Automation Era: The automation of routine processes through algorithms and AI brings a paradox to the workplace. On the one hand, it increases productivity and operational accuracy; on the other hand, it generates uncertainty and a void in traditional motivation models. The fundamental question that arises in this new reality is: How do we motivate people in an environment where their daily processes are being automated and their roles are being redefined? Classical motivation models, based mainly on monetary rewards or the performance

of standardized tasks, are proving insufficient to stimulate engagement and creativity in a Human-Machine collaboration environment.

1.3. The Importance of the Regional Context:

Albania and Bulgaria. This dynamic becomes particularly complex in the context of Small and Medium-sized Enterprises (SMEs) in transition countries, such as Albania and Bulgaria. These two economies, although at different stages of European integration and market maturity, share similar structural challenges: limited resources for research and development (R&D), an urgent need for technological modernization, as well as challenges in retaining talent. The implementation of digital tools in these realities often clashes.

1.4. Purpose and Central Argument of the Paper

This paper argues that successful innovation and the integration of AI in Albanian and Bulgarian enterprises require a radical change in management philosophy. To avoid resistance to technology and to foster a true culture of innovation, enterprises must adopt a motivational policy supported by the "competency approach". The paper elaborates the thesis that organizations should place autonomy in decision-making and continuous professional self-updating (life-long learning) at the center of their strategy. Only by transforming AI from an "operational substitute" into an "empowering tool", can managers ensure that human capital not only survives but thrives in the digital age. Through an empirical comparative analysis, this study provides a clear framework of how these theoretical concepts translate into the practical reality of regional enterprises.

2. Research Methodology

Study Design To comprehensively address the research questions of this paper, a mixed research design (mixed quantitative and qualitative methodology) was implemented. This approach was selected to enable not only the quantitative measurement of technology's impact on motivation but also a deep understanding of the psychological and perceptive nature of this impact. The quantitative approach aims to highlight the numerical correlations between variables, while the qualitative one elucidates the dynamics of organizational behavior in SME environments. This research was designed to cover several dimensions:

- Demographic and professional data.
- The level of integration of digital tools and AI in work processes.
- Assessment of motivational needs (based on theories of achievement, power, affiliation, and autonomy).
- Integration of the MBTI (Myers-Briggs Type Indicator) Personality Test: The inclusion of this test constitutes an added value to the instrument, as it enables the psychological profiling of the staff (e.g., identifying INFJ leaders) and assesses how different personality typologies react and are motivated differently by the presence of Artificial Intelligence.

Data Processing and Analysis: Initial field data collection was administered through the Google Forms platform, ensuring accuracy in collection and ease of access for respondents in both countries. After the collection phase, the database was cleaned and systematized using Microsoft Excel. To transition from descriptive data to inferential findings and to verify the study's hypotheses, processing was deepened through complex statistical analysis (including correlation analyses to measure the relationship between digital and motivational variables). The essential focus of this phase remained the comparative analysis of the results between the Albanian and Bulgarian models to highlight cultural similarities or structural divergences between the two countries

3. Empirical Analysis and Study Results

3.1. Demographic and Structural Profile of the Sample

Before testing the central hypotheses on the impact of digital transformation on motivation, it is essential to understand the anatomy of the studied sample. Data collected from 254 respondents show an interesting leadership profile in the region's SMEs. The analysis of gender distribution reveals a persistent dominance of males in managerial positions in both countries, a phenomenon that reflects the legacy of traditional industrial structures in the Balkans. However, a slight but significant trend of increasing female representation in the management of Albanian enterprises (33.94%) compared to Bulgarian ones (31%) is noted. This demographic composition plays a critical role in how technological innovation is accepted and managed within the organization.

Graph 1.Gender distribution of Manager

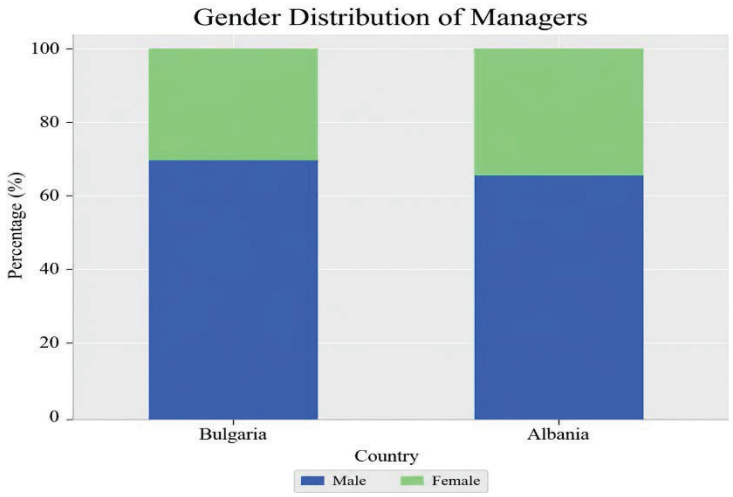

Table 1: Gender Distribution of Managers in the Sample

Country	Male (N)	Male (%)	Female (N)	Female (%)	Total (N)
Bulgaria	100	69.0%	45	31.0%	145
Albania	72	66.06%	37	33.94%	109
Total	172	67.7%	82	32.3%	254

Source: Author's processing from empirical research (2022-2023).

3.2. Paradigm Shift:

The Dominance of the Need for Autonomy At the core of this research was the measurement of the main psychological drivers that motivate management and operational staff in an era where processes are rapidly digitizing. Data extracted from the needs assessment section show a drastic decline in the effectiveness of traditional models, which were based on control and

micromanagement. The most essential finding is that Autonomy convincingly ranks as the number one need for employees in both countries (37.2% in Bulgaria and 34.9% in Albania). In the context of Artificial Intelligence, this finding is crucial: while algorithms and digital systems take over the automation of routine tasks, the modern employee requires more space and independence to make strategic decisions, solve complex problems, and exercise their creativity.

Graph 2.Comparison of Motivation Needs; AL vs BG

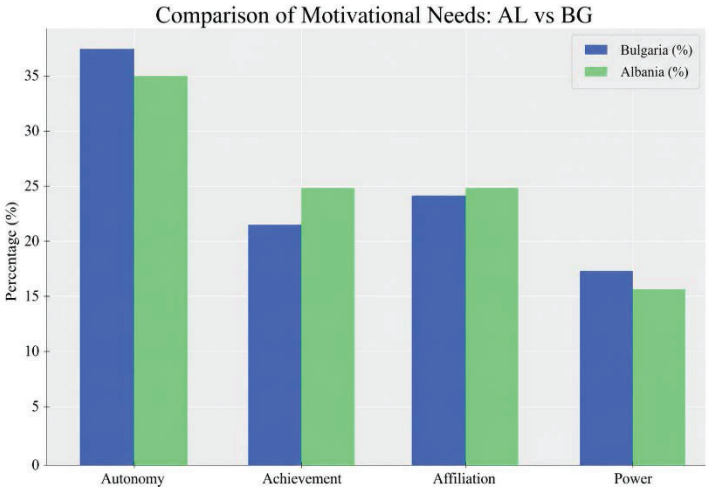

Table 2: Comparison of Motivational Needs (AL vs BG)

Motivational Need	Bulgaria (%)	Albania (%)	Regional Average
Autonomy	37.2%	34.9%	36.05%
Achievement	21.4%	24.8%	23.10%
Affiliation	24.1%	24.8%	24.45%
Power	17.2%	15.6%	16.40%
Total	**100%**	**100%**	**100%**

Source: Data analysis from the survey instrument.

3.3. Data Implications on Organizational Culture

Another finding of critical importance from Table 2 is the marked decline in the "Need for Power", which ranks last in both countries (15.6% in AL and 17.2% in BG). This indicator proves the hypothesis that in new work environments—influenced by digital collaboration tools—

autocratic leadership and rigid hierarchies are losing their function. Artificial Intelligence and real-time access to data are democratizing information within the enterprise, making employees more motivated by a sense of belonging (Affiliation) and the opportunity to perform meaningful work (Achievement and Autonomy), rather than by the desire to control other subordinates. This requires an urgent reengineering of reward and performance evaluation systems in the region's SMEs.

Table 3: Correlation Analysis (AI - Motivation Interdependence)

Study Variables	Readiness for Innovation (AI)	Motivation Level (HR)
Readiness for Innovation	1	.764**
Motivation Level	.764**	1

Note: (Sig. < .01). The positive correlation (r = .764) indicates that the implementation of AI significantly increases employee motivation when accompanied by autonomy

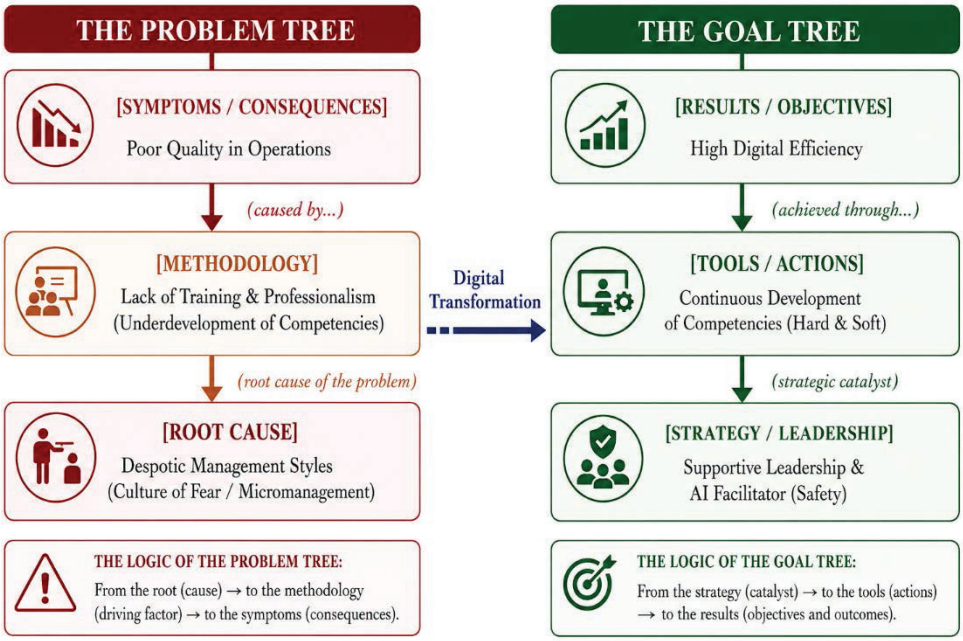
4.Analysis of Operational Processes and Its Paradigmatic Transformation in the AI Era

To understand the true obstacles to innovation in the region's SMEs, the study applied the analytical "Problem Tree" methodology, which aims to identify the root causes of operational failure, beyond superficial symptoms. Empirical analysis revealed a cause-and-effect chain deeply detrimental to the business climate: the final symptom of "Poor Quality" in operations and services stems directly from a "Lack of Professionalism" (or insufficient staff training). However, the root cause of this lack of professional development is identified in "Despotic Management Styles". In an organizational culture where leadership is based on fear and autocratic micromanagement, free initiative and the desire for professional updating are asphyxiated. With the integration of Digital Transformation and Artificial Intelligence tools, this negative hierarchy not only becomes unsustainable but leads to the certain failure of any technological investment. Artificial Intelligence cannot be successfully incorporated into a culture of fear and rigidity. For this reason, the "Problem Tree" must be engineered and turned into an "Objective Tree", shifting the focus from finding the culprit to empowering capacities.

The structural transformation occurs at three essential levels:

- **Root Level (Culture Change):** Shifting from Despotic Style to Supportive Leadership. In AI-integrated environments, the manager is no longer the "process controller" (since AI does this more accurately and faster) but becomes a facilitator and mentor. Leadership's role is to create psychological safety so that employees can experiment with new digital tools without the fear of punishment.
- **Trunk Level (Methodology Change):** Shifting from Lack of Training to Competency Development. Training for a manual task is no longer simply enough. Technology requires proactive development of "soft skills" (complex problem solving, critical thinking) and high adaptability to new algorithms.
- **Crown Level (Final Result):** Shifting from Poor Quality to Digital Efficiency. By curing the root and the trunk, the organization achieves a synergy where human capital, motivated by autonomy, uses AI to significantly increase the quality and speed of production or service.

Figure 1: Transformation of the Problem Tree into an Objective Tree



5. The New Approach: Competency-Based Motivation in the Conditions of Digital Change

5.1. Overcoming Traditional Job Analysis

In the period of classical industrial management, the basis of human resources organization was "Job Analysis". This model was based on the assumption that job roles are static, predictable, and composed of a series of routine actions. However, the disruptive nature of Digital Transformation and Artificial Intelligence makes this approach obsolete and often obstructive. When algorithms automate mechanical and repetitive tasks at a dizzying speed, traditional job descriptions lose their validity within a few months. To respond to this dynamic, the study recommends that enterprises urgently shift towards a "Competency-Based Approach". This new paradigm does not focus on "what tasks the employee does today", but on "what skills, behaviors, and cognitive potential the employee possesses to adapt to the technologies of tomorrow". Motivation in this environment no longer stems from fulfilling a list of tasks, but from continuous professional development and mastering new competencies.

5.2. Restructuring the Skills Dichotomy:

Hard Skills vs. Soft Skills: To successfully implement this new motivational approach, the human resources architecture within the enterprise must be restructured by dividing and developing competencies into two essential pillars, which must operate in synergy:

- **Hard Skills (Technical/Digital Skills):** In the new era, basic technical competencies are no longer the exclusivity of IT departments. Every employee, especially in managerial roles, is required to develop a certain level of "data literacy". This includes the ability to read complex statistics, understand basic programming logic, and interpret data generated by Artificial Intelligence platforms. These skills provide employees with the necessary tools to use technology as a lever to increase productivity, making them masters of the process rather than "victims" of automation.
- **Soft Skills (Interpersonal and Emotional Skills):** While AI tools may surpass humans in processing quantitative data at high speed, they remain profoundly deficient in the human

dimension. This is where the vital importance of Soft Skills comes into play, which includes Emotional Intelligence (EQ), complex empathetic communication, conflict resolution skills, ethical judgment, and teamwork. These are the only competencies "immune" to automation and represent the true value of human capital in a digital organization.

5.3. Emotional Intelligence as a Determinant of Strategic Success

Contemporary literature and practice prove that exclusive investment in technology, unaccompanied by the development of human competencies, leads to resistance and performance decline. To emphasize this disparity, it is worth citing the findings of long-term research by Harvard University (together with the Carnegie Foundation), which emphasize that approximately 80% of career success and organizational performance is based on soft skills and Emotional Intelligence, while only 20% is attributed to strict technical knowledge (Hard Skills). In the context of the analyzed SMEs, this finding carries extraordinary weight: the best motivation for staff facing the stress of digital transformation is training them to manage emotions, communicate effectively with the team, and lead with vision. By turning Emotional Intelligence into a KPI (Key Performance Indicator), enterprises ensure that technology serves humans, fostering an organizational culture where collaboration, innovation, and free initiative thrive.

6. Conclusions and Strategic Recommendations

6.1. Study Conclusions

In concluding this comparative research, it is clearly evident that the integration of Digital Transformation and Artificial Intelligence goes beyond the boundaries of a simple technological update; it represents a fundamental change in the paradigm of organizational behavior and human resource management. From the analysis of empirical data collected in Albanian and Bulgarian enterprises, the following central conclusions are drawn:

1. **Digital-Human Synergy:** There is a statistically strong and positive correlation between the maturity level of digital transformation within the enterprise and the degree of human resources engagement. Technology, when managed correctly, acts as a catalyst that eases the operational burden and increases job satisfaction.

2. **Autonomy as a Driving Engine:** Despite specific cultural or commercial differences between Albania and Bulgaria, the need for Autonomy proves to be the absolute engine of movement and motivation for managerial and operational staff in both countries. In an automated environment, employees seek more independence in decision-making and space to express their leadership.

3. **Criticality of Organizational Culture:** The implementation of advanced AI infrastructure, in the absence of a supportive organizational culture tolerant of mistakes, is destined to fail. Technology cannot compensate for or solve problems stemming from despotic management styles; on the contrary, a rigid hierarchical environment generates resistance and turns the digital investment into a sunk cost.

6.2. Recommendations for Managerial Practice

To ensure a successful transition to AI-based business models, the following strategic steps are recommended to the region's enterprises:

1. **Psychological Personalization of HR Policies:** Enterprises must abandon standard ("one-size-fits-all") approaches to change management. Active use of psychological profiling instruments, such as the MBTI test, is recommended to deeply understand how different employee typologies (e.g., visionary INFJ types) perceive and react to technology. This allows for

the construction of personalized motivational strategies that respect each individual's uniqueness.

2. **Creation of a "Life-Long Learning" Ecosystem:** Shifting from sporadic training to a culture of continuous education is an emergency. Companies must create internal platforms and opportunities for the uninterrupted development of competencies (upskilling and reskilling) on Artificial Intelligence tools, ensuring that no employee feels professionally obsolete.

3. **Radical Transparency to Preserve Intrinsic Motivation:** The biggest threat of AI is not job loss, but employees' loss of a sense of purpose. Boards of directors must develop transparent communication campaigns where AI is clearly positioned as an empowering tool (Co-Pilot), which increases human capacities and eliminates routine, rather than as a replacement agent. Only by demystifying technology can management protect and increase the staff's Intrinsic Motivation, which is the key to long-term innovation

Corresponding author: email: gladitoska@hotmail.com

Abstract

This study investigates teachers' perceptions regarding prospective curricular reforms within the Albanian pre-university education system, with a specific focus on levels of information, professional readiness, and expectations concerning the impact of these reforms on educational quality. The study is predicated on the hypothesis that teachers who possess comprehensive prior information regarding curricular changes demonstrate a higher degree of preparedness for their implementation.

The research methodology employs a quantitative approach, utilizing a structured questionnaire organized into three key sections: demographic data, perceptions of curricular changes, and an overall evaluation of the reform. Data were collected from teachers across various levels of the pre-university education system and analyzed through descriptive and comparative statistical techniques.

The findings indicate that the level of prior information directly influences teachers' readiness to implement the reform. Furthermore, the results highlight a critical need for continuous professional development, institutional support, and a more robust integration of technology into the pedagogical process. This study contributes to identifying the key determinants of successful curricular reform and provides evidence-based recommendations for policymakers and educational institutions to optimize the implementation process. Additionally, the study advocates for a decentralized approach to teacher training regarding the new curriculum.

Keywords: *curricular reform, teachers' perceptions, professional readiness, pre-university education, educational policy.*

1. Hyrje

Arsimi parauniversitar përbën një nga shtyllat kryesore të zhvillimit shoqëror, ekonomik dhe kulturor të një vendi. Në këtë kuadër, kurrikula luan një rol thelbësor në përcaktimin e njohurive, aftësive, kompetencave dhe vlerave që nxënësit duhet të fitojnë gjatë procesit arsimor. Ndryshimet kurrikulare janë pjesë e natyrshme e zhvillimit të sistemeve arsimore, pasi ato synojnë përshtatjen e shkollës me kërkesat e kohës, me zhvillimet teknologjike, me nevojat e tregut të punës dhe me pritshmëritë e shoqërisë bashkëkohore.

Në Shqipëri, arsimi parauniversitar ka kaluar nëpër procese të ndryshme reformimi, të cilat kanë synuar përmirësimin e cilësisë së mësimdhënies dhe të nxënies. Megjithatë, suksesi i çdo reforme arsimore nuk varet vetëm nga hartimi i dokumenteve zyrtare apo nga miratimi i politikave të reja, por edhe nga mënyra se si këto reforma kuptohen, pranohen dhe zbatohen nga mësuesit në praktikën e përditshme shkollore. Mësuesit janë aktorët kryesorë në procesin e implementimit të kurrikulës, pasi ata e përkthejnë përmbajtjen e saj në veprimtari konkrete mësimore, në strategji pedagogjike dhe në forma vlerësimi për nxënësit.

Për këtë arsye, perceptimet e mësuesve mbi ndryshimet e pritshme kurrikulare kanë rëndësi të veçantë. Niveli i informimit paraprak, gatishmëria profesionale, përvoja në mësimdhënie, mundësitë për trajnim dhe mbështetja institucionale janë faktorë që mund të ndikojnë ndjeshëm në mënyrën se si reforma do të zbatohet në shkolla. Nëse mësuesit janë të informuar dhe të përgatitur profesionalisht, ata kanë më shumë gjasa të përfshihen në mënyrë aktive në procesin e ndryshimit dhe të kontribuojnë në përmirësimin e cilësisë së arsimit. Në të kundërt, mungesa e informacionit, paqartësitë mbi përmbajtjen e reformës ose mungesa e trajnimeve mund të krijojnë pasiguri dhe rezistencë ndaj ndryshimit.

Ky studim synon të analizojë perceptimet e mësuesve të arsimit parauniversitar në Shqipëri mbi ndryshimet e pritshme kurrikulare, duke u përqendruar në tri aspekte kryesore: nivelin e informimit, gatishmërinë profesionale dhe pritshmëritë për ndikimin e reformës në cilësinë e arsimit. Studimi mbështetet në hipotezën se mësuesit që kanë më shumë informacion paraprak rreth ndryshimeve kurrikulare shfaqin një nivel më të lartë gatishmërie për zbatimin e tyre.

Rëndësia e këtij studimi qëndron në faktin se ai ndihmon në identifikimin e faktorëve që mund të lehtësojnë ose pengojnë implementimin e reformës kurrikulare. Gjetjet e tij mund të jenë të dobishme për politikëbërësit, institucionet arsimore dhe strukturat përgjegjëse për trajnimin e mësuesve, me qëllim hartimin e strategjive më efektive të mbështetjes profesionale. Në këtë drejtim, studimi synon të japë një kontribut modest në debatin mbi përmirësimin e reformave arsimore dhe forcimin e rolit të mësuesit në procesin e ndryshimit kurrikular.

2. Zhvillimi i punimit

2.1 Rishikimi i literaturës

Reformat kurrikulare përbëjnë një nga proceset më të rëndësishme të zhvillimit të sistemeve arsimore bashkëkohore. Ato synojnë përshtatjen e përmbajtjes mësimore, metodave të mësimdhënies, formave të vlerësimit dhe kompetencave të nxënësve me kërkesat e shoqërisë, zhvillimet teknologjike dhe nevojat e tregut të punës. Në literaturën ndërkombëtare, reforma kurrikulare nuk shihet vetëm si ndryshim i dokumenteve zyrtare, por si një proces kompleks që kërkon përfshirjen e institucioneve arsimore, drejtuesve të shkollave, mësuesve dhe komunitetit.

Një nga faktorët kryesorë që ndikon në suksesin e reformave kurrikulare është roli i mësuesit. Mësuesit janë aktorët kryesorë që e shndërrojnë kurrikulën nga dokument politik dhe pedagogjik në praktikë konkrete mësimore. Ata interpretojnë objektivat e kurrikulës, zgjedhin metodat e mësimdhënies, përshtatin materialet mësimore dhe vlerësojnë arritjet e nxënësve. Për këtë arsye, suksesi i reformës nuk varet vetëm nga cilësia e dokumenteve zyrtare, por edhe nga mënyra se si mësuesit e kuptojnë, e pranojnë dhe e zbatojnë atë në klasë. Perceptimet e mësuesve mbi ndryshimet kurrikulare kanë rëndësi të veçantë, pasi ndikojnë drejtpërdrejt në qëndrimet dhe sjelljen e tyre profesionale. Nëse mësuesit e shohin reformën si të nevojshme, të qartë dhe të mbështetur nga institucionet, ata kanë më shumë gjasa të angazhohen në zbatimin e saj. Në të kundërt, kur reforma perceptohet si e paqartë, e imponuar ose e vështirë për t'u zbatuar në kushtet reale të shkollës, mund të shfaqen pasiguri, hezitim ose rezistencë ndaj ndryshimit. Një element tjetër i rëndësishëm është niveli i informimit paraprak të mësuesve. Informimi i qartë për qëllimet, përmbajtjen, fazat dhe pritshmëritë e reformës ndihmon në uljen e pasigurisë dhe në rritjen e besimit profesional. Kur mësuesit kanë informacion të mjaftueshëm për ndryshimet kurrikulare, ata janë më të prirur të kuptojnë arsyet e reformës dhe të përgatiten për zbatimin e saj. Mungesa e informacionit, përkundrazi, mund të krijojë konfuzion mbi rolin e mësuesit, mbi kërkesat e reja të kurrikulës dhe mbi mënyrat konkrete të zbatimit në procesin mësimor.

Gatishmëria profesionale është një koncept qendror në studimet mbi implementimin e reformave arsimore. Ajo lidhet me njohuritë, aftësitë, qëndrimet dhe besimin që mësuesit kanë për të zbatuar ndryshimet në praktikë. Gatishmëria nuk nënkupton vetëm pranimin formal të reformës, por edhe aftësinë për të përdorur metoda bashkëkohore të mësimdhënies, për të organizuar mësimin mbi bazën e kompetencave, për të përdorur teknologjinë dhe për të përshtatur vlerësimin me rezultatet e të nxënit. Trajnimi i vazhdueshëm i mësuesve është një kusht i domosdoshëm për zbatimin e suksesshëm të reformave kurrikulare. Literatura thekson se trajnimet efektive duhet të jenë praktike, të vazhdueshme dhe të lidhura drejtpërdrejt me nevojat e mësuesve në klasë. Trajnimet e shkurtra dhe formale shpesh nuk janë të mjaftueshme për të ndryshuar praktikat e mësimdhënies. Për këtë arsye, zhvillimi profesional duhet të shihet si një proces i vazhdueshëm që shoqëron mësuesin gjatë gjithë karrierës së tij. Në kontekstin shqiptar, reformat në arsimin parauniversitar janë lidhur me përpjekjet për modernizimin e shkollës dhe përmirësimin e cilësisë së arsimit. Një drejtim i rëndësishëm ka qenë kalimi drejt kurrikulës së bazuar në kompetenca, e cila synon që nxënësit të zhvillojnë jo vetëm njohuri, por edhe aftësi praktike, mendim kritik, aftësi komunikimi dhe kompetenca digjitale. Megjithatë, zbatimi i reformës kërkon mbështetje të vazhdueshme për mësuesit, udhëzime të qarta, materiale ndihmëse dhe trajnime cilësore. Një dimension tjetër i rëndësishëm i reformës kurrikulare është integrimi i teknologjisë në procesin mësimor. Teknologjia mund të ndihmojë në rritjen e ndërveprimit në klasë, në përdorimin e burimeve të ndryshme mësimore dhe në individualizimin e të nxënit. Megjithatë, përdorimi efektiv i teknologjisë kërkon jo vetëm pajisje dhe infrastrukturë, por edhe përgatitje profesionale të mësuesve. Për këtë arsye, trajnimet për kurrikulën e re duhet të përfshijnë edhe zhvillimin e kompetencave digjitale. Në lidhje me vlerësimin, literatura thekson se ndryshimet kurrikulare duhet të shoqërohen edhe me ndryshime në mënyrën e matjes së arritjeve të nxënësve. Një kurrikulë e bazuar në kompetenca kërkon forma vlerësimi që nuk matin vetëm riprodhimin e njohurive, por edhe aftësinë për të analizuar, zbatuar, argumentuar dhe zgjidhur probleme. Literatura tregon se reformat kurrikulare janë procese komplekse që kërkojnë planifikim, komunikim, trajnim dhe mbështetje të vazhdueshme. Roli i mësuesit është vendimtar, pasi ai është lidhja kryesore ndërmjet dokumentit kurrikular dhe përvojës reale të nxënësit në klasë. Niveli i informimit, gatishmëria profesionale, mbështetja institucionale, përdorimi i teknologjisë dhe përshtatja e vlerësimit dalin si faktorë kyç që ndikojnë në suksesin e reformës. Për këtë arsye, studimi i perceptimeve të mësuesve të arsimit parauniversitar në Shqipëri është i rëndësishëm për të kuptuar se sa të përgatitur ndihen ata për ndryshimet e pritshme kurrikulare dhe cilat janë nevojat kryesore për mbështetje në procesin e implementimit.

2.2 Metodologjia

Ky studim përdor qasjen sasiore**,** pasi synon të matë perceptimet e mësuesve të arsimit parauniversitar në Shqipëri mbi ndryshimet e pritshme kurrikulare. Kjo qasje është e përshtatshme sepse mundëson mbledhjen e të dhënave të standardizuara dhe analizimin e tyre përmes metodave statistikore. Studimi ka karakter përshkrues dhe krahasues**.** Ai përshkruan nivelin e informimit, gatishmërinë profesionale dhe pritshmëritë e mësuesve për reformën kurrikulare, si edhe krahason përgjigjet sipas disa treguesve demografikë dhe profesionalë, si mosha, përvoja në mësimdhënie dhe niveli ku mësuesit japin mësim. Popullata e studimit përbëhet nga mësues të arsimit parauniversitar në Shqipëri**,** ndërsa kampioni përfshin mësues nga arsimi fillor, arsimi 9 vjeçar, gjimnazi dhe shkollat profesionale. Përzgjedhja e tyre synon të sigurojë një pasqyrë sa më të gjerë mbi perceptimet e mësuesve ndaj reformës. Instrumenti i përdorur është pyetësori i strukturuar, i ndarë në tri seksione: të dhëna demografike, perceptimi mbi ndryshimet kurrikulare dhe vlerësimi i përgjithshëm i reformës. Pyetësori përfshin pyetje me alternativa dhe pohime të vlerësuara me shkallën Likert nga 1 deri në 5, ku 1 nënkupton “aspak dakord” dhe 5 “plotësisht dakord”. Të dhënat do të analizohen përmes statistikave

përshkruese dhe krahasuese, duke përdorur frekuenca, përqindje dhe mesatare. Analiza do të fokusohet kryesisht në lidhjen ndërmjet nivelit të informimit paraprak dhe gatishmërisë profesionale të mësuesve për zbatimin e ndryshimeve kurrikulare.

Hipoteza kryesore e studimit është:

H1: *Mësuesit që kanë më shumë informacion paraprak mbi ndryshimet kurrikulare shfaqin nivel më të lartë gatishmërie profesionale për implementimin e reformës.*

Pjesëmarrja në studim do të jetë vullnetare dhe të dhënat do të trajtohen në mënyrë anonime. Rezultatet do të përdoren vetëm për qëllime akademike dhe do të paraqiten në formë të përgjithësuar.

2.3 Rezultatet e Pyetsorit dhe diskutimi

Në studim morën pjesë gjithsej 187 mësues të arsimit parauniversitar. Të dhënat demografike tregojnë se shumica e pjesëmarrësve janë femra, konkretisht 152 mësuese, ose 81.3% e kampionit, ndërsa 35 pjesëmarrës, ose 18.7%**,** janë meshkuj. Sa i përket moshës, grupmosha më e përfaqësuar është 31- 40 vjeç, me 66 pjesëmarrës, ose 35.3%. Më pas vjen grupmosha 41-50 vjeç, me 58 pjesëmarrës, ose 31%**.** Pjesëmarrësit mbi 50 vjeç përbëjnë 26.2% të kampionit, ndërsa grupmosha 22 - 30 vjeç përfaqësohet nga 14 pjesëmarrës, ose 7.5%**.** Në lidhje me përvojën në mësimdhënie, pjesa më e madhe e mësuesve kanë mbi 15 vite përvojë, përkatësisht 94 pjesëmarrës, ose 50.3%**.** Kjo tregon se kampioni përbëhet kryesisht nga mësues me eksperiencë të gjatë profesionale. Mësuesit me 9 - 15 vite përvojë përbëjnë 23 %, ata me 4 - 8 vite përvojë përbëjnë 16.6%, ndërsa mësuesit me 1 - 3 vite përvojë përbëjnë 10.2% të kampionit. Për nivelin ku japin mësim, shumica e pjesëmarrësve punojnë në arsimin 9 vjeçar, me 111 mësues, ose 59.4%. Në arsimin fillor japin mësim 59 pjesëmarrës, ose 31.6%. Në gjimnaz japin mësim 15 pjesëmarrës, ose 8%, ndërsa në shkolla profesionale japin mësim 2 pjesëmarrës, ose 1.1%. Në pyetjen nëse kanë marrë informacion paraprak për ndryshimet kurrikulare, 108 mësues, ose 57.8%, janë përgjigjur "Po". 67 mësues, ose 35.8%, janë përgjigjur "Pjesërisht", ndërsa vetëm 12 mësues, ose 6.4%, janë përgjigjur "Jo". Këto të dhëna tregojnë se shumica e mësuesve kanë një nivel të caktuar informimi paraprak për reformën, por një pjesë e konsiderueshme janë informuar vetëm pjesërisht.

Percetimi mbi ndryshimet e pritshme kurrikulare ka shumë rëndësi në seksionin B të pyetsorit. Mësuesit kanë një nivel relativisht të mirë informimi për ndryshimet e pritshme. Për këtë aspekt, mesatarja është 3.45, mesorja dhe moda janë 4, ndërsa 53% e përgjigjeve janë pozitive kundrejt 20% negative. Kjo nënkupton se më shumë se gjysma e mësuesve ndihen të informuar, por një pjesë e tyre ende nuk e percepton informacionin si të plotë. Ndërkohë, qartësia e informacionit të marrë deri tani vlerësohet pak më ulët, me mesatare 3.26, mesore 3 dhe modë 4, ku 45% e përgjigjeve janë pozitive dhe 26% negative. Kjo tregon se, megjithëse mësuesit në përgjithësi kanë marrë informacion për procesin, mënyra se si ky informacion është përcjellë nuk është plotësisht e qartë për të gjithë. Është e rëndësishme që komunikimi me mësuesit të forcohet përmes udhëzimeve më të qarta, shembujve konkretë dhe sqarimeve të vazhdueshme, në mënyrë që ata jo vetëm të jenë të informuar, por edhe ta kuptojnë plotësisht përmbajtjen dhe qëllimin e ndryshimeve. Mësuesit kanë pritshmëri përgjithësisht pozitive lidhur me ndikimin e ndryshimeve në cilësinë e arsimit. Për pohimin se ndryshimet do të përmirësojnë cilësinë e të nxënit, mesatarja është 3.41, ndërsa mesorja dhe moda janë 4, me 51% përgjigje pozitive dhe 20% negative. Kjo tregon se shumica e mësuesve priren të besojnë se ndryshimet mund të sjellin përmirësim në procesin e të nxënit, megjithëse një pjesë mbetet ende e pasigurt ose skeptike.

Pohimi se kurrikula e re do të ndihmojë zhvillimin e kompetencave vlerësohet pak më lart, me mesatare 3.45, mesore dhe modë 4, si dhe 53% përgjigje pozitive kundrejt 19% negative. Kjo sugjeron se mësuesit e shohin kurrikulën e re si një mundësi për të forcuar kompetencat e nxënësve, por nevojitet mbështetje e vazhdueshme profesionale dhe qartësi në zbatimin praktik, në mënyrë që këto pritshmëri pozitive të kthehen në rezultate konkrete në klasë.

Gatishmëria profesionale e mësuesve për zbatimin e ndryshimeve është përgjithësisht pozitive, por jo plotësisht e konsoliduar. Për pohimin se ndihen të përgatitur për zbatimin e ndryshimeve, mesatarja është 3.39, mesorja 3 dhe moda 4, me 48% përgjigje pozitive dhe 21% negative. Kjo tregon se një pjesë e konsiderueshme e mësuesve ndihen të gatshëm, por ende ka pasiguri në nivelin e përgatitjes praktike. Ndërkohë, nevoja për trajnim shtesë del më e theksuar, me mesatare 3.65, mesore 4 dhe modë 4, si dhe 61% përgjigje pozitive kundrejt 15% negative. Kjo sugjeron se, edhe pse mësuesit shfaqin gatishmëri për t'u përfshirë në proces, ata e konsiderojnë mbështetjen profesionale dhe trajnimet shtesë si të domosdoshme për zbatimin efektiv të ndryshimeve. Prandaj, suksesi i procesit varet jo vetëm nga vullneti i mësuesve, por edhe nga ofrimi i trajnimeve të qarta, praktike dhe të lidhura drejtpërdrejt me nevojat e tyre në klasë.

Mësuesit e vlerësojnë teknologjinë si një faktor të rëndësishëm mbështetës në zbatimin e ndryshimeve. Pohimi se teknologjia do të ketë rol të rëndësishëm ka mesatare 3.64, mesore dhe modë 4, me 60% përgjigje pozitive dhe vetëm 14% negative. Kjo tregon se shumica e mësuesve e shohin teknologjinë si element kyç për përmirësimin e procesit mësimor dhe për zbatimin më efektiv të kurrikulës. Megjithatë, vlerësimi për kapacitetet teknologjike të shkollës është më i ulët, me mesatare 3.36, mesore dhe modë 4, ku 50% e përgjigjeve janë pozitive dhe 27% negative. Kjo sugjeron se, ndonëse mësuesit e njohin rëndësinë e teknologjisë, ata nuk janë plotësisht të bindur se shkollat aktualisht kanë kapacitetet e nevojshme për ta mbështetur këtë proces. Prandaj, krahas theksimit të rolit të teknologjisë, është e domosdoshme të forcohet infrastruktura teknologjike në shkolla, të sigurohen pajisje dhe mjete të përshtatshme, si dhe të ofrohet mbështetje praktike për përdorimin efektiv të tyre në mësimdhënie.

Mësuesit e perceptojnë rritjen e ngarkesës së punës si një nga sfidat e mundshme të zbatimit të ndryshimeve. Për këtë pohim, mesatarja është 3.5, ndërsa mesorja dhe moda janë 4, me 52% përgjigje pozitive dhe 17% negative. Kjo tregon se më shumë se gjysma e mësuesve pajtohen se ndryshimet mund të sjellin rritje të angazhimit profesional, detyrave administrative ose kërkesave për planifikim e përshtatje në mësimdhënie. Megjithatë, përqindja relativisht më e ulët e përgjigjeve negative sugjeron se kjo shqetësim nuk është i njëtrajtshëm te të gjithë mësuesit. Prandaj, gjatë zbatimit të ndryshimeve, është e rëndësishme të merren masa për të menaxhuar ngarkesën e punës, duke ofruar udhëzime të qarta, materiale mbështetëse dhe organizim më efikas të detyrave, në mënyrë që ndryshimet të mos perceptohen si barrë shtesë, por si proces i realizueshëm dhe i qëndrueshëm për mësuesit.

Mësuesit kanë vlerësime më të kujdesshme lidhur me ndikimin e ndryshimeve te nxënësit. Për pohimin se nxënësit do të përshtaten lehtësisht, mesatarja është 3.24, mesorja dhe moda janë 3, me 40% përgjigje pozitive dhe 22% negative. Kjo tregon se mësuesit nuk janë plotësisht të bindur se përshtatja e nxënësve do të jetë e lehtë, duke sugjeruar se ky proces mund të kërkojë kohë, udhëzim dhe mbështetje të vazhdueshme në klasë. Ndërkohë, vlerësimi për ndikimin e kurrikulës në nxitjen e mendimit kritik dhe kreativitetit është më pozitiv, me mesatare 3.53, mesore dhe modë 4, si dhe 55% përgjigje pozitive kundrejt 17% negative. Kjo tregon se mësuesit e shohin kurrikulën si të dobishme për zhvillimin e aftësive më të larta të të menduarit, por njëkohësisht evidenton nevojën që zbatimi të shoqërohet me metoda konkrete, aktivitete praktike dhe mbështetje pedagogjike, në mënyrë që nxënësit të përshtaten gradualisht dhe të përfitojnë realisht nga ndryshimet. Rezultatet tregojnë se mbështetja institucionale perceptohet nga mësuesit si e pranishme, por jo plotësisht e mjaftueshme. Për pohimin se institucionet ofrojnë mbështetje të mjaftueshme, mesatarja është 3.4, mesorja dhe moda janë 3, me 48% përgjigje pozitive dhe 18% negative. Kjo tregon se gati gjysma e mësuesve e vlerësojnë

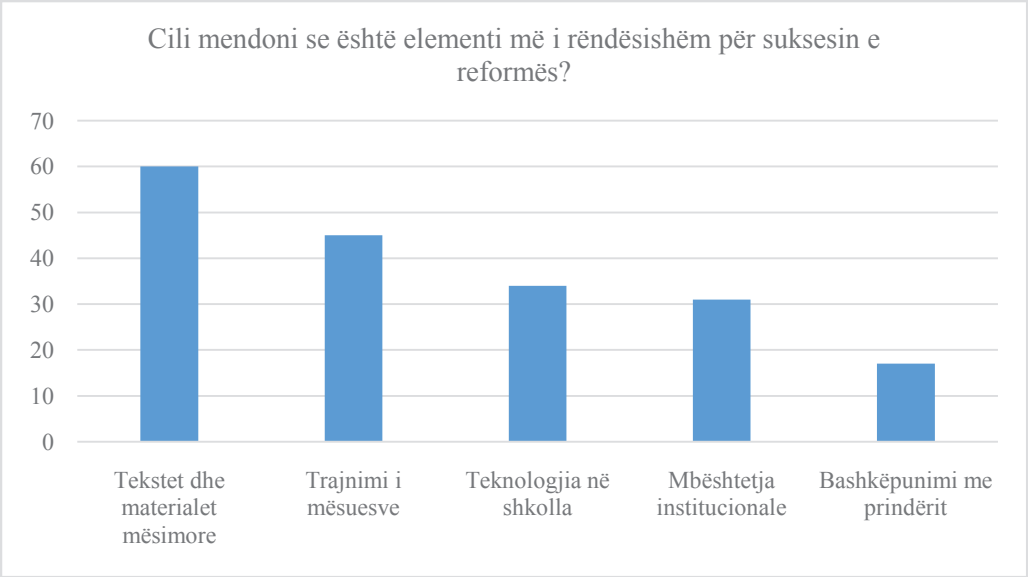
pozitivisht rolin mbështetës të institucioneve, por vlerat mesore dhe modale në nivelin 3 sugjerojnë një qëndrim të matur dhe jo plotësisht të konsoliduar. Pra, një pjesë e mësuesve duket se nuk është ende e bindur se mbështetja aktuale është e mjaftueshme për zbatimin efektiv të ndryshimeve. Për këtë arsye, është e rëndësishme që institucionet të forcojnë komunikimin, të ofrojnë udhëzime më të qarta, trajnim të vazhdueshëm dhe mbështetje praktike në shkolla, në mënyrë që mësuesit të ndihen më të sigurt dhe më të përkrahur gjatë gjithë procesit të ndryshimeve.

Seksioni C synon të evidentojë perceptimin e mësuesve mbi gatishmërinë e sistemit arsimor për zbatimin e ndryshimeve të reja kurrikulare, si dhe të identifikojë faktorët që konsiderohen më të rëndësishëm për suksesin e reformës. Përmes këtij seksioni vlerësohet jo vetëm niveli i besimit ndaj kapaciteteve institucionale, por edhe qëndrimi i përgjithshëm i mësuesve ndaj domosdoshmërisë së ndryshimeve kurrikulare. Pyetjet e përfshira ndihmojnë në kuptimin e nevojave kryesore që duhet të adresohen, si trajnimi i mësuesve, cilësia e teksteve dhe materialeve mësimore, teknologjia në shkolla, mbështetja institucionale dhe bashkëpunimi me prindërit. Ky seksion ofron një pasqyrë të përgjithshme mbi kushtet, pritshmëritë dhe sfidat që lidhen me zbatimin e reformës kurrikulare.

Grafik nr 1: Si e vlerësoni gatishmërinë e sistemit arsimor për ndryshimet e reja kurrikulare?

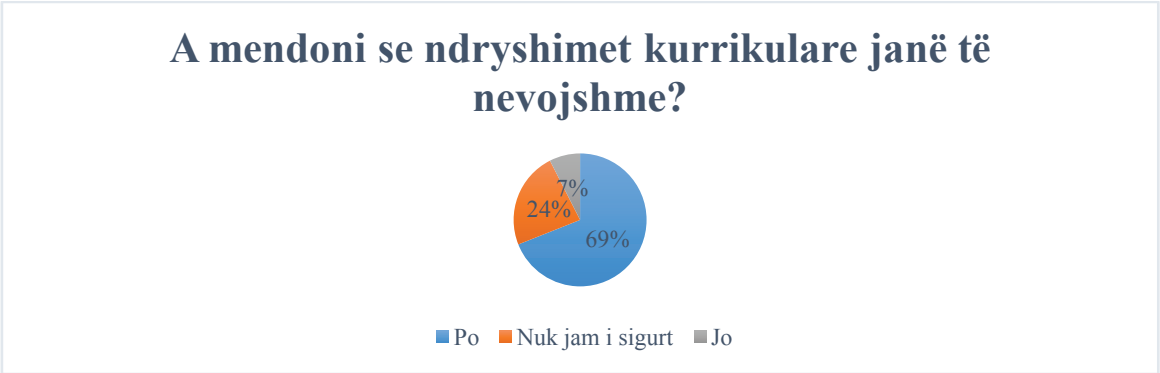
Pjesa më e madhe e të anketuarve e vlerëson gatishmërinë e sistemit arsimor si mesatare ose të mirë. Konkretisht, 41.2% e konsiderojnë gatishmërinë mesatare, ndërsa 34.2% e vlerësojnë të mirë. Një pjesë më e vogël, 13.4 %, e vlerësojnë shumë të mirë. Ndërkohë, vlerësimet negative janë më të ulëta, me 8 % që e konsiderojnë gatishmërinë të ulët dhe 3.2% shumë të ulët. Të dhënat tregojnë një perceptim përgjithësisht të kujdesshëm, por jo negativ. Sistemi arsimor shihet si pjesërisht i përgatitur për ndryshimet e reja kurrikulare, me nevojë për mbështetje të mëtejshme institucionale, profesionale dhe organizative.

Grafik nr. 2: Cili mendoni se është elementi më i rëndësishëm për suksesin e reformës?



Suksesi i reformës kurrikulare nuk varet vetëm nga ideja e ndryshimit, por sidomos nga kushtet konkrete që e bëjnë reformën të zbatueshme në klasë. Kur 32.1% zgjedhin tekstet dhe materialet mësimore si elementin më të rëndësishëm, ata po tregojnë se reforma duhet të mbështetet te materiale të qarta, të sakta, të përditësuara dhe të përshtatshme për nxënësit. Nëse tekstet nuk janë cilësore ose nuk përputhen mirë me kurrikulën e re, mësuesit dhe nxënësit do ta kenë më të vështirë ta zbatojnë reformën në praktikë. Ndërsa 24.1% që zgjedhin trajnimin e mësuesve tregojnë se mësuesit kanë nevojë të përgatiten mirë për ndryshimet. Edhe kur tekstet janë të mira, reforma nuk mund të ketë sukses nëse mësuesit nuk janë të qartë për metodat e reja, mënyrën e planifikimit, vlerësimit dhe zbatimit të përmbajtjes në klasë. Ideja kryesore është kjo: të anketuarit mendojnë se reforma do të ketë sukses vetëm nëse shoqërohet me materiale mësimore cilësore dhe me mësues të trajnuar mirë. Këto dy elemente lidhen drejtpërdrejt me punën e përditshme në klasë, ndaj edhe janë vlerësuar më shumë se faktorët e tjerë.

Grafik nr.3: A mendoni se ndryshimet kurrikulare janë të nevojshme?



Për pyetjen "A mendoni se ndryshimet kurrikulare janë të nevojshme?", përgjigjet tregojnë një mbështetje të qartë për reformën kurrikulare. Nga 187 të anketuar, 129 persona ose 69 % janë shprehur se ndryshimet janë të nevojshme. Kjo tregon se shumica e pjesëmarrësve e perceptojnë reformën si një proces të domosdoshëm për përmirësimin e cilësisë së arsimit dhe përshtatjen e shkollës me kërkesat e kohës. Nga ana tjetër, 44 të anketuarose 23.5% janë shprehur të pasigurt. Kjo kategori është e rëndësishme, sepse nuk përfaqëson kundërshtim të drejtpërdrejtë, por më tepër nevojë për më shumë informacion, sqarim dhe përfshirje në

procesin e ndryshimeve. Vetëm 14 persona ose 7.5 % janë përgjigjur "Jo", duke treguar se kundërshtimi ndaj reformës është relativisht i ulët.

3. Tabelat për pyetsorin

Seksioni A: Të dhëna demografike

Tabela nr 1. *Gjinia e pjesëmarrësve*

Gjinia	Numri	Përqindja

4. Përfundime

Ky studim kishte si qëllim të analizonte perceptimet e mësuesve lidhur me ndryshimet e reja kurrikulare, gatishmërinë e sistemit arsimor për zbatimin e tyre, si dhe faktorët që ndikojnë në suksesin e reformës. Nga të dhënat e mbledhura rezulton se ndryshimet kurrikulare perceptohen nga shumica e të mësuesve si të nevojshme, gjë që tregon një qëndrim përgjithësisht pozitiv ndaj reformës. Megjithatë, ky qëndrim pozitiv shoqërohet me kërkesën për më shumë përgatitje, mbështetje dhe qartësi në procesin e zbatimit.

Gatishmëria e sistemit arsimor vlerësohet kryesisht në nivele mesatare dhe të mira, ku dëshmon se mësuesit nuk e perceptojnë sistemin si të papërgatitur plotësisht, por as si tërësisht të gatshëm për ndryshimet e reja. Kjo nënkupton se ekziston një bazë fillestare për zbatimin e reformës, por ajo duhet të forcohet përmes masave konkrete dhe të qëndrueshme. Në këtë drejtim, elementët më të rëndësishëm për suksesin e reformës lidhen me cilësinë e teksteve dhe materialeve mësimore, trajnimin profesional të mësuesve, mbështetjen institucionale, teknologjinë në shkolla dhe bashkëpunimin me prindërit.

Një nga gjetjet më të rëndësishme të studimit është se mësuesit e lidhin suksesin e reformës jo vetëm me përmbajtjen e dokumenteve kurrikulare, por edhe me kushtet reale të zbatimit në klasë. Komentet dhe sugjerimet e të anketuarve theksojnë nevojën për trajnime më praktike dhe më të specializuara, për tekste më cilësore e më të përshtatura, për materiale didaktike, për infrastrukturë më të mirë dhe për ulje të ngarkesës burokratike. Këto të dhëna tregojnë se reforma kurrikulare duhet të trajtohet si një proces gjithëpërfshirës, ku mësuesit nuk janë vetëm zbatues, por edhe aktorë të rëndësishëm në përmirësimin e saj.

Në raport me hipotezën kryesore të studimit, sipas së cilës *mësuesit që kanë më shumë informacion paraprak mbi ndryshimet kurrikulare shfaqin nivel më të lartë gatishmërie profesionale për implementimin e reformës*, rezultatet e mbështesin pjesërisht këtë hipotezë. Të dhënat sugjerojnë se informimi paraprak, qartësia mbi qëllimet e reformës dhe trajnimi profesional ndikojnë pozitivisht në qëndrimin dhe gatishmërinë e mësuesve. Megjithatë, hipoteza nuk mund të konsiderohet plotësisht e vërtetuar në kuptimin statistikor, pasi studimi mbështetet kryesisht në të dhëna perceptuese dhe nuk përfshin një analizë të drejtpërdrejtë korrelative ndërmjet nivelit të informimit dhe gatishmërisë profesionale.

Rëndësia e rezultateve qëndron në faktin se ato evidentojnë faktorët që duhen adresuar përpara dhe gjatë zbatimit të reformës. Për të rritur gatishmërinë profesionale të mësuesve, është e nevojshme që institucionet arsimore të sigurojnë informim të hershëm, trajnime cilësore, udhëzime të qarta, materiale mësimore funksionale dhe mbështetje të vazhdueshme në nivel shkolle. Po ashtu, përfshirja e mësuesve në procesin e diskutimit dhe vendimmarrjes do të ndikonte në rritjen e besimit dhe angazhimit të tyre ndaj reformës.

Studimi ka edhe disa kufizime:

Së pari, të dhënat bazohen në perceptimet e të anketuarve dhe jo në vëzhgime të drejtpërdrejta të praktikave mësimore.

Së dyti, kampioni i përfshirë mund të mos përfaqësojë plotësisht të gjithë mësuesit e sistemit arsimor.

Së treti, mungesa e analizave statistikore më të thelluara kufizon mundësinë për të përcaktuar me saktësi marrëdhënien ndërmjet informimit paraprak dhe gatishmërisë profesionale.

Rezultatet tregojnë se reforma kurrikulare ka një bazë të mirë pranimi, por suksesi i saj varet nga mënyra se si ajo përgatitet, komunikohet dhe mbështetet në praktikë. Sa më të informuar, të trajnuar dhe të mbështetur të jenë mësuesit, aq më e lartë pritet të jetë gatishmëria e tyre profesionale për zbatimin e ndryshimeve kurrikulare.

Abstract

In an era of accelerated digitalization, the educational paradigm faces a critical challenge: the waning influence of the physical book as the primary medium for knowledge acquisition. This study aims to analyze the impact of digital technology on students' reading habits and evaluate whether the transition from physical to screen-based reading is precipitating a shift from reflective reading—"deep immersion"—toward superficial "skimming," as theorized by Nicholas Carr.

To examine this phenomenon, a quantitative study was conducted via a survey administered to pre-university students. The questionnaire focused on comparing concentration spans, information retention, and distraction levels across different reading formats: physical books versus digital devices.

The study is grounded in the hypothesis that there is a negative correlation between the dominant use of screens for academic purposes and the capacity for deep cognitive processing. It posits that students who primarily engage with digital devices exhibit lower levels of long-term information retention compared to those who engage with printed text.

Quantitative findings reveal that over 70% of students report experiencing distractions within ten minutes of screen-based reading. These results underscore the urgent need for a pedagogical reorientation. The study concludes by proposing strategies to transform technology from a source of distraction into an ally of intellectual depth, fostering a reading ecosystem that synthesizes digital advantages with the cognitive discipline of traditional reading.

Keywords: *Digital reading, cognitive processes, superficial reading (skimming), chronic distraction, education, digital competence*.

1. Hyrje

Në dekadat e fundit, zhvillimi i shpejtë i teknologjisë dixhitale ka sjellë ndryshime të thella në mënyrën se si njerëzit komunikojnë, informohen, lexojnë dhe mësojnë. Në veçanti, nxënësit e arsimit parauniversitar janë ndër grupet më të ekspozuara ndaj përdorimit të pajisjeve dixhitale, pasi telefoni inteligjent, tableti, kompjuteri dhe platformat online janë bërë pjesë e përditshmërisë së tyre. Këto mjete u ofrojnë atyre mundësi të shumta për qasje të shpejtë në informacion, për kërkim të materialeve mësimore, për komunikim dhe për zhvillimin e aftësive të reja. Krahas përfitimeve që sjell teknologjia, përdorimi i saj i shpeshtë ka ngritur edhe shqetësime lidhur me cilësinë e leximit, nivelin e përqendrimit dhe mënyrën e përpunimit të informacionit.

Libri fizik, i cili për një kohë të gjatë ka shërbyer si mjet kryesor për përvetësimin e njohurive dhe zhvillimin e të menduarit kritik, po përballet gjithnjë e më shumë me konkurrencën e teksteve dixhitale. Leximi në ekran është bërë një praktikë e zakonshme për shumë nxënës, sidomos kur ata kërkojnë informacion për detyra, projekte shkollore apo përgatitje mësimore. Ky lloj leximi shpesh shoqërohet me ndërprerje të vazhdueshme, njoftime nga aplikacionet, kalim të shpejtë nga një faqe në tjetrën dhe pririe për të skanuar tekstin në vend që të lexohet në mënyrë të thelluar. Kjo situatë ngre pyetjen nëse përdorimi i gjerë i ekraneve po ndikon në

zbehjen e leximit reflektiv dhe në dobësimin e aftësisë së nxënësve për t'u përqendruar për periudha më të gjata.

Ky studim synon të analizojë ndikimin e teknologjisë dixhitale mbi shprehitë e leximit te nxënësit dhe të vlerësojë ndryshimet që shfaqen midis leximit në libër fizik dhe leximit përmes pajisjeve dixhitale. Vëmendje e veçantë i kushtohet kohëzgjatjes së përqendrimit, mbajtjes mend të informacionit, nivelit të shpërqendrimit dhe mënyrës se si nxënësit e përjetojnë procesin e leximit në secilin format. Studimi mbështetet në idenë se leximi në ekran mund të nxisë një formë më sipërfaqësore të përvetësimit të informacionit, ndërsa leximi në libër fizik lidhet më shumë me përqendrim, reflektim dhe angazhim të qëndrueshëm me tekstin.

Për të shqyrtuar këtë fenomen, është zhvilluar një pyetësor me nxënësit e arsimit parauniversitar, përmes të cilit janë mbledhur të dhëna mbi zakonet e tyre të leximit dhe përdorimin e pajisjeve dixhitale për qëllime studimore. Pyetësori ka pasur si qëllim të evidentojë se sa shpesh nxënësit lexojnë në ekran, sa kohë arrijnë të qëndrojnë të përqendruar gjatë këtij procesi, në çfarë mase shpërqendrohen dhe si e vlerësojnë aftësinë e tyre për të mbajtur mend informacionin pas leximit. Nëpërmjet përgjigjeve të tyre, studimi synon të krijojë një pasqyrë më të qartë mbi mënyrën se si teknologjia ndikon në sjelljet e leximit dhe në procesin e të nxënit.

Rëndësia e këtij studimi qëndron në faktin se leximi nuk është thjesht një veprim teknik i marrjes së informacionit, por një proces kompleks që lidhet me përqendrimin, kujtesën, analizën, interpretimin dhe zhvillimin e mendimit kritik. Nëse leximi dixhital përdoret pa kontroll dhe pa strategji të përshtatshme pedagogjike, ai mund të ndikojë në uljen e vëmendjes dhe në dobësimin e përpunimit të thellë kognitiv. Nga ana tjetër, teknologjia nuk duhet parë vetëm si faktor shpërqendrimi, por edhe si një mundësi për të pasuruar procesin mësimor, nëse përdoret në mënyrë të ndërgjegjshme, të planifikuar dhe të balancuar me leximin tradicional.

Ky punim synon të evidentojë sfidat që lidhen me kalimin nga leximi fizik drejt leximit dixhital, duke u mbështetur në të dhënat e mbledhura nga pyetësori me nxënësit. Përmes analizës së këtyre të dhënave, studimi kërkon të nxjerrë përfundime mbi ndikimin e ekraneve në përqendrim dhe në mbajtjen mend të informacionit, si dhe të propozojë mënyra përmes të cilave teknologjia mund të shndërrohet në një mjet ndihmës për të nxitur të nxënit e thellë. Në këtë mënyrë, synohet krijimi i një qasjeje të balancuar, ku avantazhet e teknologjisë dixhitale ndërthuren me disiplinën, vëmendjen dhe thellësinë kognitive që karakterizojnë leximin tradicional.

2. Zhvillimi i punimit

2.1 Rishikimi i literaturës

Zhvillimi i shpejtë i teknologjisë digjitale ka sjellë ndryshime të dukshme në mënyrën se si nxënësit lexojnë, mësojnë dhe përpunojnë informacionin. Në kontekstin bashkëkohor, leximi nuk kufizohet më vetëm te libri fizik, por është zhvendosur gjithnjë e më shumë drejt ekraneve, platformave online dhe pajisjeve digjitale. Ky ndryshim ka krijuar mundësi të reja për qasje të shpejtë në informacion, por njëkohësisht ka ngritur shqetësime mbi cilësinë e leximit, nivelin e përqendrimit dhe aftësinë e nxënësve për të përvetësuar njohuritë në mënyrë të thelluar.

Literatura bashkëkohore mbi leximin digjital thekson se kalimi nga teksti i printuar drejt tekstit në ekran nuk është vetëm një ndryshim teknik, por edhe një ndryshim në mënyrën e të menduarit dhe të përpunimit të informacionit. Leximi tradicional, sidomos ai në libër fizik, lidhet shpesh me përqendrim më të gjatë, reflektim, analizë dhe ndërtim gradual të kuptimit. Ndërsa leximi në ekran, për shkak të natyrës së tij dinamike dhe të ndërprerjeve të shpeshta, mund të nxisë një mënyrë më të shpejtë, më fragmentare dhe më sipërfaqësore të leximit.

Një nga autorët më të rëndësishëm që ka trajtuar këtë çështje është Nicholas Carr. Në veprën e tij The Shallows: What the Internet Is Doing to Our Brains, Carr argumenton se përdorimi i vazhdueshëm i internetit dhe i pajisjeve digjitale ndikon në aftësinë e njeriut për t'u përqendruar për periudha të gjata. Sipas tij, mjedisi digjital i mëson lexuesit të kalojnë shpejt nga një informacion te tjetri, duke favorizuar skanimin e tekstit në vend të leximit të thelluar. Kjo ide është veçanërisht e rëndësishme për këtë studim, pasi lidhet drejtpërdrejt me hipotezën se nxënësit që përdorin më shumë ekranet për qëllime studimore mund të shfaqin më shumë shpërqendrim dhe më pak aftësi për përpunim të thellë kognitiv.

Në të njëjtën linjë, studiuesja Maryanne Wolf ka analizuar ndikimin e epokës digjitale mbi "trurin lexues". Sipas saj, leximi i thelluar nuk është një aftësi që zhvillohet automatikisht, por kërkon ushtrim, kohë, vëmendje dhe kontakt të vazhdueshëm me tekste që nxisin reflektim. Wolf thekson se mjedisi digjital, megjithëse ofron mundësi të mëdha për informacion dhe ndërveprim, mund të ndikojë në dobësimin e durimit kognitiv dhe në zvogëlimin e aftësisë për të qëndruar gjatë mbi një tekst. Për këtë arsye, ajo sugjeron rëndësinë e një ekuilibri midis leximit tradicional dhe përdorimit të teknologjisë.

Studimet empirike mbi krahasimin midis leximit në letër dhe leximit në ekran kanë treguar se formati i leximit mund të ndikojë në kuptimin dhe mbajtjen mend të informacionit. Disa kërkime kanë vënë në dukje se lexuesit shpesh arrijnë rezultate më të mira në kuptimin e teksteve të gjata kur lexojnë në letër, krahasuar me leximin në ekran. Kjo lidhet me faktin se libri fizik krijon një marrëdhënie më të qëndrueshme me tekstin, lehtëson orientimin hapësinor në faqe dhe redukton ndërprerjet që vijnë nga aplikacionet, njoftimet apo lidhjet e jashtme.

Një element qendror në literaturë është koncepti i shpërqendrimit digjital. Pajisjet digjitale nuk shërbejnë vetëm si mjete leximi, por edhe si mjete komunikimi, argëtimi dhe ndërveprimi social. Për këtë arsye, gjatë leximit në ekran, nxënësit mund të ekspozohen ndaj njoftimeve, mesazheve, rrjeteve sociale dhe faqeve të tjera që e ndërpresin vazhdimësinë e leximit. Këto ndërprerje ndikojnë në uljen e përqendrimit dhe e bëjnë më të vështirë rikthimin te thelbi i tekstit. Në këtë mënyrë, leximi në ekran mund të kthehet nga një proces reflektiv në një proces të copëzuar dhe të fragmentuar.

Në kontekstin arsimor, kjo problematikë merr rëndësi të veçantë. Nxënësit e shkollave të mesme ndodhen në një fazë ku zhvillimi i aftësive të leximit, analizës dhe mendimit kritik është thelbësor për formimin e tyre akademik. Nëse leximi bëhet kryesisht në mënyrë sipërfaqësore, atëherë rrezikohet jo vetëm kuptimi i tekstit, por edhe aftësia për të lidhur idetë, për të reflektuar mbi përmbajtjen dhe për të ruajtur informacionin në kujtesë afatgjatë. Kjo e bën të nevojshëm studimin e shprehive të leximit të nxënësve në epokën digjitale.

Literatura nuk e trajton teknologjinë vetëm si faktor negativ. Përkundrazi, shumë studiues theksojnë se teknologjia mund të jetë një mjet i vlefshëm në procesin mësimor, nëse përdoret në mënyrë të ndërgjegjshme dhe të strukturuar. Pajisjet digjitale mund të ndihmojnë në kërkimin e informacionit, në përdorimin e burimeve të larmishme, në vizualizimin e koncepteve komplekse dhe në rritjen e ndërveprimit në klasë. Problemi nuk qëndron te vetë teknologjia, por te mënyra se si ajo përdoret dhe te mungesa e strategjive për të ruajtur përqendrimin gjatë leximit digjital.

Shkolla duhet të ndihmojë nxënësit jo vetëm të përdorin teknologjinë, por edhe ta menaxhojnë atë. Ndërthurja e librit fizik me mjetet digjitale mund të krijojë një model hibrid leximi, ku teknologjia shërben si mbështetje, ndërsa libri fizik ruan rolin e tij në zhvillimin e disiplinës kognitive. Literatura e shqyrtuar mbështet idenë se leximi digjital ka ndikim të drejtpërdrejtë në shprehitë e nxënësve dhe në mënyrën se si ata përqendrohen, kuptojnë dhe mbajnë mend informacionin. Konceptet e leximit reflektiv, leximit sipërfaqësor, shpërqendrimit kronik dhe përpunimit kognitiv të thellë përbëjnë bazën teorike mbi të cilën ndërtohet analiza sasiore e këtij punimi. Përmes pyetësorit të zhvilluar me nxënësit e shkollave të mesme, synohet të

verifikohet nëse këto prirje të evidentuara në literaturë shfaqen edhe në përvojën konkrete të nxënësve.

2.2 Metodologjia

Ky studim është konceptuar si një kërkim sasior me karakter përshkrues dhe analitik, i cili synon të shqyrtojë ndikimin e leximit digjital në zbehjen e leximit reflektiv te nxënësit e shkollave të mesme. Zgjedhja e qasjes sasiore lidhet me nevojën për të mbledhur të dhëna të matshme mbi shprehitë e leximit, nivelin e përqendrimit, shpërqendrimin dhe perceptimin e nxënësve për përvetësimin e informacionit gjatë leximit në formate të ndryshme.

Hipoteza e studimit:

Përdorimi dominues i pajisjeve digjitale për lexim dhe studim lidhet me uljen e përqendrimit, rritjen e shpërqendrimit dhe dobësimin e leximit reflektiv te nxënësit e shkollave të mesme.

Popullata e studimit përbëhet nga nxënës të arsimit të mesëm të lartë, të cilët janë përdorues të rregullt të materialeve mësimore si në format fizik, ashtu edhe në format digjital. Përzgjedhja e këtij grupi lidhet me faktin se nxënësit e shkollave të mesme ndodhen në një fazë të rëndësishme të zhvillimit akademik dhe kognitiv, ku leximi, përqendrimi dhe aftësia për të përpunuar informacionin luajnë rol të drejtpërdrejtë në arritjet shkollore.

Instrumenti i përdorur për mbledhjen e të dhënave është një pyetësor i strukturuar me titull "Shprehitë e leximit në epokën digjitale". Pyetësori është hartuar në funksion të qëllimit dhe hipotezës së studimit, sipas së cilës përdorimi dominues i ekraneve për qëllime studimore lidhet me ulje të përqendrimit, rritje të shpërqendrimit dhe prirje drejt leximit sipërfaqësor. Ai përmban dhjetë pyetje të organizuara në tri seksione kryesore.

Seksioni i parë përfshin të dhëna të përgjithshme demografike dhe akademike, si viti i shkollimit, mesatarja e notave dhe mjeti kryesor që nxënësit përdorin për leximin e materialeve mësimore. Këto të dhëna shërbejnë për profilizimin e pjesëmarrësve dhe për të parë nëse ekzistojnë dallime në shprehitë e leximit sipas nivelit të shkollimit apo performancës akademike.

Seksioni i dytë fokusohet te shprehitë e leximit dhe proceset kognitive. Në këtë pjesë maten tregues të tillë si kohëzgjatja e përqendrimit gjatë leximit në ekran, ndjesia e sigurisë në mbajtjen mend të informacionit, prirja për skanim të tekstit dhe vështirësia për t'u rikthyer te thelbi i materialit pas shpërqendrimit nga njoftimet digjitale. Ky seksion përbën pjesën qendrore të instrumentit, pasi lidhet drejtpërdrejt me analizën e kalimit nga leximi reflektiv drejt leximit sipërfaqësor.

Seksioni i tretë trajton qëndrimet e nxënësve ndaj përdorimit të teknologjisë në procesin mësimor dhe mundësitë për riorientim pedagogjik. Përmes pyetjeve mbi integrimin e teknologjisë në klasë, strategjitë për rritjen e përqendrimit dhe perceptimin mbi librin e së ardhmes, synohet të identifikohen zgjidhje të mundshme për një përdorim më të balancuar të teknologjisë në mbështetje të leximit të thelluar.

Të dhënat e mbledhura nga pyetësori janë përpunuar përmes analizës përshkruese, duke u mbështetur në frekuenca dhe përqindje. Kjo mënyrë analize mundëson paraqitjen e qartë të prirjeve kryesore të nxënësve lidhur me formatin e preferuar të leximit, nivelin e shpërqendrimit dhe perceptimin mbi efektivitetin e leximit fizik dhe digjital. Rezultatet e pyetësorit përdoren për të vlerësuar hipotezën e studimit dhe për të nxjerrë përfundime mbi ndikimin e teknologjisë digjitale në proceset kognitive të nxënësve.

2.3 Rezultatet e pyetsorit dhe diskutimi

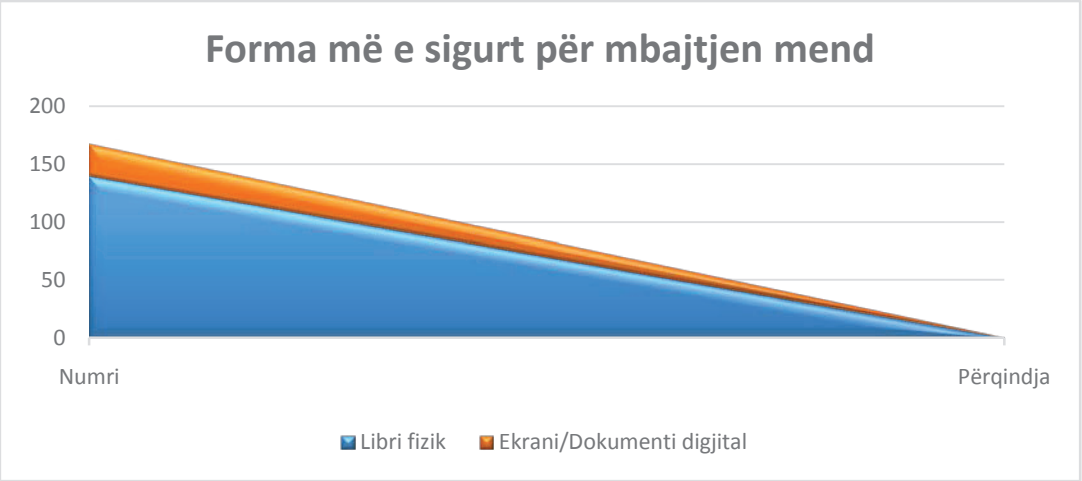
Në seksionin e parë të pyetësorit u synua profilizimi i nxënësve pjesëmarrës në studim, duke marrë në konsideratë tri tregues kryesorë: vitin e shkollimit, mesataren e notave dhe mjetin kryesor që përdorin për leximin e materialeve mësimore. Nga të dhënat rezulton se pjesëmarrjen më të madhe e përbëjnë nxënësit e klasës së 10-të, me 47.6% të kampionit. Nxënësit e klasës së 12-të përbëjnë 26.8%, ndërsa nxënësit e klasës së 11-të përbëjnë 25.6%. Kjo shpërndarje tregon se kampioni përfshin përfaqësim nga të tri vitet e arsimit të mesëm të lartë, me dominim të klasës së 10-të. Sa i përket mesatares së notave, grupi më i madh i nxënësve deklaron mesatare 9.5 deri në 10, me 29.8%. Më pas vijnë nxënësit me mesatare 7.5 deri në 8, me 27.4%, dhe ata me mesatare 8.5 deri në 9, me 21.4%. Këto të dhëna tregojnë se pjesa më e madhe e pjesëmarrësve kanë nivel të mirë ose shumë të mirë akademik, gjë që e bën më të besueshme analizën e shprehive të leximit në raport me përqendrimin dhe përvetësimin e informacionit. Në lidhje me mjetin kryesor të përdorur për leximin e materialeve mësimore, rezulton se 47.6% e nxënësve preferojnë librin ose tekstin fizik. Ndërkohë, 41.7% deklarojnë se përdorin të dyja format në mënyrë të barabartë, pra librin fizik dhe pajisjet digjitale. Vetëm 8.3% përdorin kryesisht pajisje digjitale, si tablet, laptop apo telefon, ndërsa 2.4% kanë zgjedhur alternativën "asnjëra".

Të dhënat e Seksionit 2 tregojnë se leximi në ekran ndikon në përqendrimin dhe mënyrën e përvetësimit të informacionit te nxënësit. Sipas rezultateve, 12.5% e nxënësve deklarojnë se ndiejnë nevojën për pushim ose shpërqendrohen brenda më pak se 10 minutash gjatë leximit në ekran. Ndërkohë, 43.5% e ndiejnë këtë nevojë pas 10 deri në 30 minutash, ndërsa 44% pas më shumë se 30 minutash. Këto rezultate tregojnë se një pjesë e konsiderueshme e nxënësve arrijnë të ruajnë përqendrimin për më shumë se 10 minuta, por leximi në ekran mbetet i lidhur me prirjen për ndërprerje gjatë procesit të leximit si në grafikun 1.

Grafik nr 1: Koha gjatë leximit në ekran

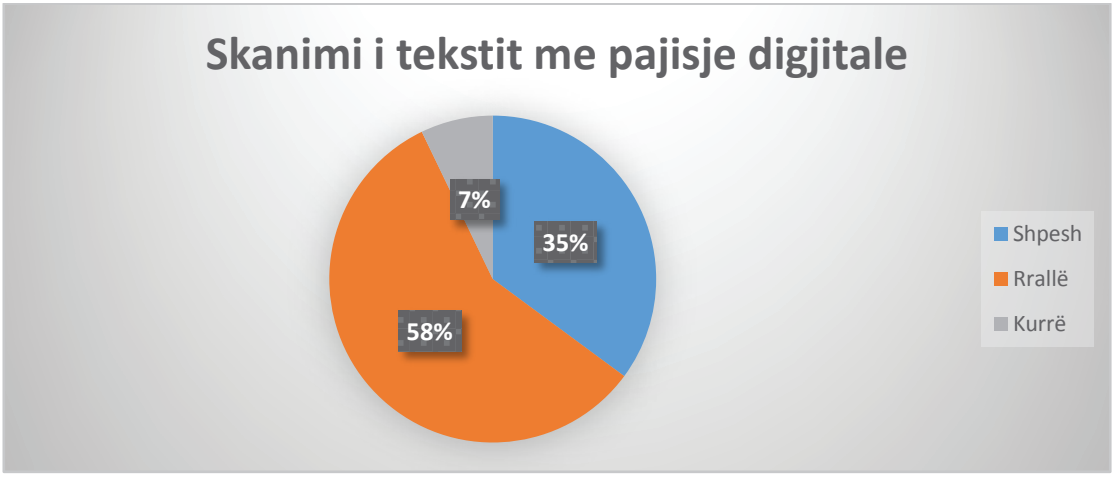
Në lidhje me formën e leximit që krijon më shumë siguri për mbajtjen mend të informacionit, 83.3% e nxënësve deklarojnë se ndihen më të sigurt kur lexojnë në libër fizik, ndërsa 16.7% zgjedhin ekranin ose dokumentin digjital. Ky rezultat mbështet idenë se libri fizik vazhdon të perceptohet si formati më i besueshëm për kuptimin, përqendrimin dhe ruajtjen e informacionit në kujtesë si në grafikun 2.

Grafik nr 2: Forma më e sigurt për mbajtjen mend



Sa i përket skanimit të tekstit në pajisje digjitale, 35.1% e nxënësve deklarojnë se e bëjnë këtë shpesh, 57.7% rrallë, ndërsa 7.1% nuk e bëjnë kurrë. Këto të dhëna tregojnë se leximi sipërfaqësor është i pranishëm te një pjesë e madhe e nxënësve, edhe pse jo gjithmonë në mënyrë të shpeshtë. Prania e kësaj prirjeje mbështet shqetësimin se leximi digjital mund të nxisë kalimin nga leximi reflektiv drejt leximit më të shpejtë dhe më pak të thelluar si në grafikun 3.

Grafik nr 3: Skanimi i tekstit me pajisje digjitale.



Në pyetjen që lidhet me vështirësinë për t'u rikthyer te thelbi i tekstit pas shpërqendrimit nga njoftimet, 15.5% e nxënësve deklarojnë se e kanë gjithmonë të vështirë, 68.5% shprehen se kjo u ndodh ndonjëherë, ndërsa 16.1% deklarojnë se nuk e kanë asnjëherë këtë vështirësi. Kjo tregon se njoftimet digjitale ndikojnë te shumica e nxënësve të paktën herë pas here, duke ndërprerë vazhdimësinë e leximit dhe rikthimin e vëmendjes.

Rezultatet e këtij seksioni mbështesin hipotezën se përdorimi i pajisjeve digjitale për lexim lidhet me prirje për shpërqendrim, skanim të tekstit dhe vështirësi në përqendrim të qëndrueshëm. Të dhënat tregojnë gjithashtu se problemi nuk qëndron vetëm te përdorimi i teknologjisë, por te mënyra se si ajo menaxhohet gjatë procesit të të nxënit. Për këtë arsye, del e nevojshme që shkolla të orientojë nxënësit drejt strategjive që kufizojnë shpërqendrimet dhe nxisin leximin e thelluar, duke ndërthurur avantazhet e mjeteve digjitale me përqendrimin dhe disiplinën që ofron libri fizik.

Seksioni i tretë i pyetësorit synon të analizojë qëndrimin e nxënësve ndaj përdorimit të teknologjisë në procesin mësimor, strategjitë që ata i konsiderojnë më të dobishme për rritjen e përqendrimit dhe mënyrën se si e imagjinojnë librin e së ardhmes në jetën e tyre akademike.

Nga të dhënat e pyetjes së parë, rezulton se nxënësit kanë kryesisht një qëndrim mesatar deri pozitiv ndaj integrimit të teknologjisë në klasë. Përqindja më e lartë i përket vlerësimit 3, me 41.7%, ku tregon se shumica e nxënësve e konsiderojnë teknologjinë si mesatarisht ndihmuese në kuptimin e koncepteve komplekse. Ndërkohë, 19% kanë zgjedhur vlerësimin 4, ndërsa 26.2% kanë zgjedhur vlerësimin 5. Kjo do të thotë se 45.2% e nxënësve kanë një perceptim pozitiv për rolin e teknologjisë në klasë. Nga ana tjetër, vetëm 6.5% kanë zgjedhur vlerësimin 1 dhe 6.5% vlerësimin 2, duke treguar se pjesa që e sheh teknologjinë si pak ose aspak ndihmuese është e ulët.

Në pyetjen e dytë, që lidhet me strategjitë për rritjen e përqendrimit gjatë studimit me pajisje digjitale, alternativa më e përzgjedhur është kthimi te leximi fizik për tekstet e gjata, me 47%. Kjo tregon se nxënësit e lidhin leximin fizik me përqendrim më të qëndrueshëm dhe me përvetësim më të thellë të informacionit. Alternativa e dytë më e përzgjedhur është përdorimi i aplikacioneve që bllokojnë njoftimet gjatë studimit, me 36.3%, gjë që tregon se nxënësit e njohin ndikimin shpërqendrues të njoftimeve digjitale. Ndërsa 16.7% kanë zgjedhur përdorimin e teknikave si Pomodoro, duke e parë menaxhimin e kohës si mënyrë për të përmirësuar përqendrimin.

Në pyetjen e tretë, që lidhet me mënyrën se si nxënësit e imagjinojnë librin e së ardhmes, përgjigjet janë të shpërndara në mënyrë relativisht të balancuar. Alternativa hibrid, pra ndërthurja e librit fizik me mjetet digjitale, është zgjedhur nga 35.7% e nxënësve. Ndërkohë, 32.7% e shohin librin e së ardhmes si vetëm fizik, ndërsa 31.5% si vetëm digjital. Këto rezultate tregojnë se, edhe pse teknologjia ka një prani të rëndësishme në jetën akademike të nxënësve, nuk ka një dominim të qartë të formatit digjital. Prirja më e lartë është drejt një modeli hybrid si në grafikun 4.

Grafiku nr 4: Preferenca e librit në të ardhmen.

3. Tabelat për pyetsorin

Seksioni 1: Të dhëna demografike

Tabela nr 1. *Përmbledhje viti i shkollimit, mesatarja e notave, mjeti kryesor i leximit.*

1. Shpërndarja sipas vitit të shkollimit		
Kategoria	**Nr. plotësues**	**Përqindja**
Klasa e 10-të	80	47.6%
Klasa e 11-të	43	25.6%
Klasa e 12-të	45	26.8%
2. Shpërndarja sipas mesatares së notave		
Kategoria	**Nr. plotësues**	**Përqindja**
5.5-6	14	8.3%
6.5-7	22	13.1%
7.5-8	46	27.4%
8.5-9	36	21.4%
9.5-10	50	29.8%
3. Mjeti kryesor për leximin e materialeve mësimore		
Kategoria	**Nr. plotësues**	**Përqindja**
Libri/teksti fizik	80	47.6%
Të dyja në mënyrë të barabartë	70	41.7%
Pajisje digjitale (Tablet, laptop, telefon)etj	14	8.3%
Asnjëra	4	2.4%
Total	**168**	**100%**

Seksioni 2: Shprehitë e leximit dhe proceset kognitive

Tabela nr 2: *Përmbledhje e pyetjeve mbi leximin dhe proceset kognitive.*

1. Pas sa kohësh ndodh nevoja për pushim ose shpërqendrim?		
Alternativa	**Nr. plotësues**	**Përqindja**
Nën 10 minuta	21	12.5%
10 - 30 minuta	73	43.5%
Mbi 30 minuta	74	44%
Forma që krijon më shumë siguri për mbajtjen mend		
Alternativa	Nr. plotësues	Përqindja
Libri fizik	140	83.3%
Ekrani/Dokumenti digjital	28	16.7%
3. Skanimi i tekstit në pajisje digjitale		
Alternativa	**Nr. plotësues**	**Përqindja**

Shpesh	59	35.1%
Rrallë	97	57.7%
Kurrë	12	7.1%
4. Vështirësia për rikthim te thelbi pas njoftimeve		
Alternativa	**Nr. plotësues**	**Përqindja**
Gjithmonë	26	15.5%
Ndonjëherë	115	68.5%
Asnjëherë	27	16.1%
Totali	**168**	**100%**

Seksioni 3: E ardhmja dhe riorientimi pedagogjik

Tabela nr 3: Përmbledhje e pyetjeve për të ardhmen dhe orientimin e leximit të librave.

Integrimi i teknologjisë në klasë ndihmon në kuptimin e koncepteve komplekse		
Alternativa	**Nr. plotësues**	**Përqindja**
1 Aspak	11	6.5%
2 Pak	11	6.5%
3 Mesatarisht	70	41.7%
4 Shumë	32	19%
5 Shumë shumë	44	26.2%
2. Strategjia që ndihmon më shumë për rritjen e përqendrimit		
Alternativa	**Nr. plotësues**	**Përqindja**
Aplikacione që bllokojnë njoftimet gjatë studimit	61	36.3%
Përdorimi i teknikave si "Pomodoro" (intervalet 25 min)	28	16.7%
Kthimi te leximi fizik për tekstet e gjata	79	47%
3. Libri i së ardhmes në jetën akademike		
Alternativa	**Nr. plotësues**	**Përqindja**
Vetëm digjital	53	31.5%
Hibrid	60	35.7%
Vetëm fizik	55	32.7%
Total	**168**	**100%**

4. Përfundime

Ky studim shqyrtoi zbehjen e leximit reflektiv në epokën digjitale, duke analizuar mënyrën se si nxënësit e shkollave të mesme përdorin librin fizik dhe pajisjet digjitale për lexim dhe studim. Në qendër të punimit qëndroi pyetja nëse kalimi nga leximi tradicional drejt leximit në ekran ndikon në përqendrim, në mbajtjen mend të informacionit dhe në prirjen drejt leximit sipërfaqësor.

- Libri fizik vazhdon të ruajë një rol të rëndësishëm në përvojën akademike të nxënësve. Ai perceptohet si formati më i besueshëm për lexim të thelluar, përqendrim dhe përvetësim më të qëndrueshëm të njohurive. Kjo tregon se, pavarësisht përhapjes së teknologjisë, teksti i printuar nuk e ka humbur funksionin e tij formues në procesin mësimor.
- Leximi digjital shfaqet si një praktikë e pashmangshme në jetën shkollore të nxënësve, por edhe si një format që kërkon menaxhim më të kujdesshëm. Të dhënat tregojnë se ekrani lidhet me shpërqendrim, ndërprerje të vëmendjes dhe skanim të tekstit. Këto prirje dëshmojnë se leximi në pajisje digjitale mund të dobësojë vazhdimësinë e përqendrimit dhe të kufizojë përpunimin e thellë të informacionit, sidomos kur përdoret pa kontroll dhe pa strategji të qarta studimi.

Në raport me hipotezën e studimit, gjetjet e mbështesin atë në thelbin e saj. Përdorimi dominues i pajisjeve digjitale për lexim dhe studim lidhet me rritje të shpërqendrimit dhe me prirje drejt leximit më sipërfaqësor. Megjithatë, rezultatet nuk e paraqesin teknologjinë si pengesë absolute për të nxënit. Përkundrazi, ato tregojnë se ndikimi i saj varet nga mënyra e përdorimit, nga niveli i vetërregullimit të nxënësve dhe nga orientimi pedagogjik që ofron shkolla.

Një nga përfundimet më të rëndësishme të këtij punimi është se ***sfida nuk qëndron te zgjedhja midis librit fizik dhe teknologjisë digjitale, por te mënyra se si këto dy formate mund të ndërthuren në mënyrë funksionale***. Libri fizik mbetet i domosdoshëm për tekste të gjata, analiza të thelluara dhe zhvillimin e leximit reflektiv, ndërsa teknologjia mund të përdoret për kërkim, burime shtesë, vizualizim dhe ndërveprim mësimor.

Studimi sugjeron nevojën për një model hibrid leximi, ku teknologjia nuk zëvendëson librin fizik, por e plotëson atë. Ky model kërkon që nxënësit të udhëzohen në përdorimin e ndërgjegjshëm të mjeteve digjitale, në kufizimin e shpërqendrimeve dhe në zhvillimin e strategjive që ruajnë përqendrimin. Vetëm përmes një qasjeje të tillë mund të ndërtohet një ekosistem leximi që përfiton nga mundësitë e epokës digjitale, pa humbur thellësinë, reflektimin dhe disiplinën kognitive që ofron leximi tradicional.

Lista e shkurtesave dhe simboleve

% - Përqindje

OECD - Organizata për Bashkëpunim dhe Zhvillim Ekonomik

PISA - Programi për Vlerësimin Ndërkombëtar të Nxënësve

TIK - Teknologjia e Informacionit dhe Komunikimit

N - Numri i pjesëmarrësve / numri i përgjigjeve

n - Numri i rasteve për një kategori të caktuar

Deep reading - Lexim i thelluar / lexim reflektiv

Skimming - Lexim sipërfaqësor / skanim i tekstit

Notifications - Njoftime digjitale

Pomodoro - Teknikë e menaxhimit të kohës me intervale pune dhe pushimi

Abstrakt

Ky studim analizon marrëdhënien midis mekanizmit të Halving-ut të Bitcoin-it dhe transformimit strukturor të tregut global të kriptomonedhave, me theks të veçantë mbi implikimet për kontekstin shqiptar dhe ballkanik një perspektivë që mungon sistematikisht nga literatura ndërkombëtare ekzistuese. Ndërsa studimet e mëparshme kanë trajtuar çështjen ekskluzivisht nga prizmi i tregjeve të zhvilluara perëndimore (SHBA, BE), ky punim ofron një kontribut origjinal: analizën e dinamikave të Bitcoin-it nga pozita e një ekonomie të vogël, me treg financiar në zhvillim dhe me kontekst të veçantë emigrimi.

Hipoteza kryesore argumenton se ndërkohë që Halving mbetet katalizatori programatik i cikleve të çmimit, faktori dominues ka evoluar drejt likuiditetit institucional global (M2 + ETF). Sidoqoftë, për Shqipërinë dhe rajonin ballkanik, vlen një dinamikë shtesë: kriptomonedhave u shërbejnë si alternativë e transfertave të remitancave, si instrument i ruajtjes së vlerës kundër zhvlerësimit të monedhave lokale, dhe si portë hyrjeje në tregjet financiare ndërkombëtare për grupe demografike të pabankarizuara.

Punimi integron analizën teorike (Stock-to-Flow, Reflexivity, Teoria e Lojës) me analizën krahasimore të katër cikleve historike (2012–2024), një sondazh explorues me 87 investitorë retail shqiptarë, dhe vlerësimin e impaktit të kornizave rregullatore europiane (MiCA) mbi vendet kandidate si Shqipëria. Gjetjet sugjerojnë se Bitcoin-i, në kontekstin vendor, kryen funksione ekonomike unike që ndryshojnë nga ato të tregjeve të zhvilluara funksione të cilat politikat rregullatore duhet t'i marrin parasysh.

***Fjalët kyçe**: Bitcoin, Halving, Ciklet e Tregut, ETF, Stock-to-Flow, Likuiditeti M2, Maturimi i Tregut, Shqipëria, Ballkan, Remitanca, MiCA, Rregullimi Ligjor, Adoptimi Retail.*

1. HYRJE

Lindja e Bitcoin-it në janar 2009, nga dora e enigmatikut Satoshi Nakamoto, nuk ishte thjesht një inovacion teknologjik ishte një deklaratë filozofike ndaj sistemit financiar global. Zhvilluar menjëherë pas krizës bankare të vitit 2008, Bitcoin propozoi një alternativë radikale: para të pavarura, me politikë monetare të paracaktuar dhe të pandryshueshme, të imunizuara ndaj vendimmarrjes politike të bankave qendrore.

Elementi ndoshta më origjinal i kësaj arkitekture monetare është Halving-u ngjarja e programuar çdo 210,000 blloqe (rreth 4 vjet) që përgjysmon shpërblimin e minatorëve. Ky mekanizëm, i kodifikuar nga vetë Nakamoto, e bën Bitcoin-in formalisht deflacionar: oferta e re zvogëlohet në mënyrë të parashikueshme, deri në kufirin maksimal prej 21 milion BTC.

Historikisht, çdo Halving ka shërbyer si katalizator i rritjes parabolike të çmimit: rritje prej ~9,000% pas Halvingut 2012; ~2,900% pas atij të 2016; dhe ~700% pas atij të 2020. Por viti 2024 shënon një pikë kthese pa precedent: aprovimi i ETF-ve spot nga SEC (janar 2024), me BlackRock dhe Fidelity si aktorë kryesorë, injektoi miliarda dollarë kapital institucional duke ndryshuar themelet e tregut.

Ky punim shqyrton një çështje qendrore që literatura ndërkombëtare nuk e ka adresuar mjaftueshëm: si ndikon ky transformim global mbi tregjet e vogla në zhvillim si Shqipëria? A ndjek tregu shqiptar të njëjtat cikle? Çfarë funksionesh specifike kryen Bitcoin-i në kontekstin e ekonomive ballkanike me remitanca të larta, bankarizim të ulët dhe monedha të dobëta?

Hipoteza kryesore: Ndërsa Halving mbetet shtyllë kurrizore e modelit ekonomik të Bitcoin-it, motori primar i cikleve të çmimit ka evoluar drejt sinergjisë M2 + ETF institucionale. Por për kontekstin shqiptar, ekziston një shtresë e tretë e funksionimit: Bitcoin si instrument financiar i komunitetit emigrant dhe si alternativë ndaj sistemit formal bankar.

Problematika qendrore e këtij studimi është: A është ende Halving ndikimi tek oferta motori primar i cikleve të çmimit të Bitcoin-it? Apo ky rol po zëvendësohet nga dinamika e kërkesës institucionale dhe lidhja me likuiditetin global (M2)?

Hipoteza kryesore e punimit është: "Ndërsa Halving redukton ofertën e re të Bitcoin-it sipas një orari të paracaktuar algoritmik, hyrja masive e institucioneve përmes ETF-ve po e transformon Bitcoin-in në një aset gjithnjë e më të korreluar me likuiditetin global (M2) dhe me tregjet tradicionale financiare, duke reduktuar volatilitetin ciklik dhe duke prolonguar fazat e rritjes."

2. RISHIKIMI I LITERATURES DHE MODELET

Kuptimi i dinamikave të çmimit të Bitcoin-it kërkon integrimin e disa kornizave teorike nga fusha të ndryshme: nga ekonomia monetare klasike, teoria e financave të sjelljes (behavioral finance), teoria e lojës (game theory) dhe ekonomia informacionale. Ky kapitull prezanton dhe analizon kritikerisht modelet kryesore teorike.

2.1 Modeli Stock-to-Flow (S2F) – Rrallësia si Vlerë

Modeli Stock-to-Flow (S2F), i popullarizuar nga analisti anonim Plan B në vitin 2019, ofron kornizën sasiore më të njohur për vlerësimin e Bitcoin-it bazuar në rrallësinë programatike. Raporti S2F llogaritet si:

S2F = (Stoku Total) ÷ (Prodhimi Vjetor i Ri)

Ari, që konsiderohet "standardi i artë" i rrallësisë, ka një raport S2F prej rreth 60 që do të thotë se do të duheshin 60 vite prodhimi aktual për të dyfishuar rezervat ekzistuese. Pas Halvingut të Prill 2024, kur shpërblimi u reduktua nga 6.25 BTC në 3.125 BTC për bllok, raporti S2F i Bitcoin-it u ngrit mbi 120 dyfish ai i arit. Ky fakt është jashtëzakonisht i rëndësishëm: nga këndvështrimi i rrallësisë programatike, Bitcoin u bë "dy herë më i rrallë" se ari, metali i çmuar historikisht më i vlefshëm.

Sidoqoftë, modeli S2F ka marrë kritika të forta nga akademikë si Nic Carter dhe David Puell, të cilët argumentojnë se çmimi nuk varet vetëm nga oferta, por edhe nga kërkesa. Modeli i injorion plotësisht faktorët makroekonomikë si normat e interesit, liquiditetin global dhe ndryshimet rregullatore. Kjo dobësi u bë e dukshme në vitin 2022, kur Bitcoin humbi mbi 70% të vlerës pavarësisht raportit të lartë S2F – kryesisht për shkak të rritjes agresive të normave të interesit nga Rezerva Federale Amerikane (Fed).

2.2 Teoria e Reflexivity – Cikli i Vetë-Përforcimit

Teoria e Reflexivity, e formuluar nga investitori dhe filozofi George Soros, ofron një kornizë të fuqishme për të kuptuar sjelljen ciklike të çmimit të Bitcoin-it. Soros argumenton se tregjet financiare nuk janë pasqyrë pasive e realitetit ekonomik, por aktorë aktiv që ndikojnë tek ai: perceptimet e investitorëve influencojnë çmimet, dhe çmimet influencojnë perceptimet duke krijuar cikle të vetë-përforcuara (feedback loops).

Në kontekstin e Bitcoin-it, ky fenomen manifestohet qartë: kur çmimi rritet pas një Halving, media kryesore (mainstream media) raporton gjerësisht, duke tërhequr investitorë retail të rinj; kjo rrit kërkesën dhe çmimin; çmimi i lartë tërheq vëmendjen e institucioneve; institucionet blejnë; çmimi rritet akoma; dhe kjo tërheq edhe më shumë kapital. Ky cikël pozitiv vazhdon derisa arriy saturation pikën kur të gjithë aktorët e gatshëm kanë blerë dhe fillojnë realizimet e fitimeve, duke nisur fazën e korrigjimit.

Teoria e Reflexivity shpjegon gjithashtu pse ciklet e Bitcoin-it kanë tendencën e "overshoot" kalojnë ndjeshëm mbi vlerën themelore (fair value) dhe pse korrigjimin e pasojnë rëniet dramatike: psikologjia e tregut amplifikon lëvizjet në të dyja drejtimet.

2.3 Teoria e Lojës dhe Sjellja e Minatorëve

Minatorët e Bitcoin-it luajnë një rol qendror në ekuilibrin e tregut.Teoria e lojës ndihmon të kuptojmë sjelljen strategjike të minatorëve pas çdo Halving. Kur shpërblimi përgjysmohet, minatorët me kosto të lartë produksioni (energji e shtrenjtë, pajisje të vjetruara) dalin nga tregu fenomeni "miner capitulation". Kjo zvogëlon hashrate-in përkohësisht, por njëkohësisht redukton presionin e shitjes.

Me institucionalizimin e minimit, dinamika ka ndryshuar: kompani si Marathon Digital dhe Riot Platforms mbajnë BTC-të e marra si shpërblim pa i shitur menjëherë duke reduktuar ofertën e tregut. Ky "financiarizim i minimit" ka implikime gjeopolitike: hashrate-i po përqendrohet në SHBA dhe Europë Veriore, duke lënë jashtë loje minatorët e vegjël individualë përfshirë ata ballkanikë.

3. ANALIZA KRAHASIMORE E CIKLEVE (2012–2024)

Analiza historike e katër cikleve kryesore të Bitcoin-it zbulon tendenca të qarta: rritja relative pas Halvingut po zvogëlohet gradualisht (Diminishing Returns), ndërsa stabiliteti i tregut – edhe pse ende i ulët në terma absolute po rritet. Tabela e mëposhtme ofron një panoramë të konsoliduar të performancës historike:

Tabela 1: *Krahasimi i Cikleve Historike të Bitcoin-it (2012–2024)*

Cikli	Data e Halving	Çmimi Para	Rritja Pas 1 Viti	Max Drawdown
Cikli 1 (2012)	Nëntor 2012	~$12	~9,000%	-93%
Cikli 2 (2016)	Korrik 2016	~$650	~2,900%	-84%
Cikli 3 (2020)	Maj 2020	~$8,700	~700%	-77%
Cikli 4 (2024)	Prill 2024	~$63,000	Në proces	Parashikohet <55%

Tre tendenca strukturore dalin qartë nga të dhënat:

- Ligji i Kthimeve Zvogëluese (Diminishing Returns): Rritja nga ~9,000% (Cikli 1) në ~700% (Cikli 3) reflekton thellimin e tregut me kapitalizim mbi $1.2 trilion USD, lëvizja e çmimit kërkon kapital gjithnjë e më të madh.
- Reduktimi i Drawdown Maksimal: Rënia nga -93% (2012) në -77% (2020) reflekton thellimin e tregut (market depth) dhe prezencën e blerësve institucionalë që "blejnë rëniet" (buy the dip).
- Zgjatja dhe Ndryshimi i Formës Ciklike: Teoria e "Left-Translated Cycle" sugjeron se me kapitalin institucional, kulmi mund të vijë më herët dhe korrigjimi të jetë më i moderuar model i ngjashëm me arit pas 2008.

3.1 Analiza On-Chain: Sinjalet e Maturimit

Të dhënat on-chain nga platformat si Glassnode ofrojnë evidencë shtesë të paçmueshme mbi maturimin e tregut. Metrikat kryesore includin:

- HODL Waves: Treguesi tregon se përqindja e BTC-ve të paluajtura për mbi një vit ka arritur nivele rekord (>70% e ofertës totale), tregues i fortë se investitorët afatgjatë ("strong hands") po dominojnë strukturën e pronësisë.
- Realized Cap vs Market Cap: Diferenca midis kapitalizimit të realizuar dhe atij të tregut e quajtur "Net Unrealized Profit/Loss" (NUPL) – tregon nëse tregu është në fazë euforie (shitje intensive) apo frike (blerje oportunistike).
- Exchange Outflows: Transferta masive të BTC-ve nga exchange-t në portofola private fenomen i dukshëm pas Halvingut 2024 – sinjalizojnë blerje afatgjata nga institucione, duke reduktuar ofertën e disponueshme për tregti.

4. NDIKIMI INSTITUCIONAL: "ERA E ETF-VE"

Ky artikull përfaqëson ndoshta aspektin më të rëndësishëm dhe transformues të analizës. Aprovimi nga SEC i ETF-ve të Bitcoin-it me mbushje fizike (spot) në janar 2024 pas shumë vitesh refuzimesh shënoi ndryshimin paradigmatik të tregut. Brenda vetëm 11 ditëve të para të tregtimit, ETF-të e reja absorbuan mbi $10 miliard USD kapital neto – rekordi historik për çdo ETF të re të lansuar ndonjëherë në tregjet amerikane.

4.1 Përthithja e Ofertës: Matematika e Çekuilibrit

Impakti i drejtpërdrejtë i ETF-ve mbi ofertën është dramatik. Pas Halvingut të Prill 2024, minatorët prodhojnë rreth 450 BTC të reja çdo ditë (nga 900 BTC para Halvingut). Krahasimi me blerjet e ETF-ve të ditëve të para zbulon një çekuilibër strukturor të paprecedentë:

Prodhimi Ditor i Minatorëve: ~450 BTC | Blerjet Ditore të ETF-ve (Janar 2024): ~3,000–5,000 BTC

Me fjalë të tjera, ETF-të blejnë deri në 10 herë më shumë Bitcoin sesa prodhohet çdo ditë. Kjo është "absorption rate" (shkalla e përthithjes) e paprecedentë në historinë e tregut. BlackRock vetëm nëpërmjet fondit të saj iShares Bitcoin Trust (IBIT) u bë brenda javësh mbajtësi i tretë më i madh i Bitcoin-it në botë, pas vetë Satoshi Nakamoto-s dhe fondacionit Binance.

Ky fenomen krijon një presion blerës struktural që nuk varet nga ndjenjat e investitorëve retail ose nga ciklet psikologjike të frikës dhe lakmisë. Fondet institucionale operojnë mbi bazën e qëllimeve afatgjata të alokimit të portofolit nëse vendosin të alokojnë 1-2% të totalit të aseteve tek Bitcoin, kjo do të thotë dhjetëra miliarda dollarë blerje, pavarësisht lëvizjeve afatshkurtra të çmimit.

4.2 Ndryshimi i Korrelacionit me Tregjet Tradicionale

Një nga pasojat më të rëndësishme dhe debatabile të institucionalizimit të Bitcoin-it është ndryshimi i profilit të korrelacionit me tregjet tradicionale. Historikisht, Bitcoin ishte i njohur si "uncorrelated asset" aktiv pa korrelacion me aksionet, obligacionet apo metalet e çmuara. Kjo e bënte atë tërheqës si mjet diversifikimi portofoli.

Megjithatë, të dhënat e fundit tregojnë rritje të ndjeshme të korrelacionit me indekset Nasdaq dhe S&P 500, veçanërisht gjatë periudhave të stresit të tregut. Gjatë likuidimit masiv të tregut nga frika e normave të interesit (Q1 2022), Bitcoin humbi vlerë njëkohësisht me aksionet e teknologjisë – duke bërë të dukshme se sjellja e tij si "aset i sigurt" ishte e kufizuar.

Ky fenomen shpjegohet me "institutional herding" – tendencën e investitorëve institucionalë për të shitur aktivet më të likuida (si Bitcoin-i) fillimisht, kur u duhet kapital urgjent, pavarësisht bazave themelore. Nga njëra anë, kjo zvogëlon vlerën e diversifikimit; nga ana tjetër, konfirmon integrimin e Bitcoin-it në mainstream financiar – hap i rëndësishëm drejt maturimit.

5. NDIKIMI I LIKUIDITETIT GLOBAL – CIKLI M2

Analiza e vetëm ofertës Bitcoin-it (perspektiva Halving/S2F) është e pamjaftueshme pa konsideruar kontekstin makroekonomik global. Studime empirike të shumta kanë dokumentuar korrelacionin e fortë midis rritjes së masës monetare globale (M2) dhe performancës së Bitcoin-it duke sugjeruar se tregu i kriptomonedhave funksionon si një "sfungjer i likuiditetit" global.

5.1 Mekanizmi i Transmisionit

Masa monetare M2 përfshin paratë cash, depozitat bankare dhe instrumentet likuide afatshkurtra. Kur bankat qendrore angazhohen në politika monetare ekspansioniste (Quantitative Easing, ulje normash interesi), M2 rritet duke hedhur likuiditet shtesë në sistemin financiar. Investitorët, duke kërkuar kthime mbi inflacionin, kthehen drejt aseteve alternative: fillimisht aksioneve dhe pasurive të patundshme, pastaj aseteve me risk të lartë si Bitcoin-i.

Korrelacioni midis rritjes globale të M2 dhe çmimit të Bitcoin-it është vëzhguar të jetë mbi 0.85 në periudhën 2020-2023 shumë më i lartë se korrelacioni midis Bitcoin-it dhe ngjarjeve specifike on-chain. Kjo sugjeron se politika monetare globale ka ndikimin primar, ndërsa Halving ofron katalizatorin psikologjik dhe narrativën.

5.2 Periudha 2020-2021 vs. 2022-2023: Rasti i Studimit

Periudha 2020-2021 është shembulli paradigmatik i efektit M2. Bankat qendrore globale, në përgjigje të pandemisë COVID-19, injektuan mbi $11 trilion USD likuiditet ndërmjet viteve 2020-2021. Bitcoin reagoi duke kaluar nga ~$8,700 (para Halvingut të Majit 2020) në ~$69,000 (Nëntor 2021) rritje prej rreth 700% brenda 18 muajve. Halving u dha minatorëve arsye psikologjike për të mos shitur, por motori i vërtetë ishte likuiditeti i paprecedentë global.

Kontrapozita erdhi në vitin 2022: Fed-i filloi ciklin më agresiv të rritjes së normave të interesit nga viti 1980, duke tërhequr mbi $1 trilion USD nga sistemi financiar përmes Quantitative Tightening. Pavarësisht raportit të lartë S2F dhe bazave themelore të pandryshura të Bitcoin-it, çmimi u shemb nën $16,000 demonstrimi i qartë se likuiditeti makroekonomik mbizotëron mbi dinamikat e brendshme.

5.3 Konkluzioni i Modelit të Integruar

Ky punim propozon një model të integruar të tri shtresave për të shpjeguar dinamikat e çmimit:

- Shtresa 1 – Oferta (Halving/S2F): Krijon bazën strukturore të rrallësisë dhe ofron "katalizatorin" psikologjik dhe narrativën afatmesme.
- Shtresa 2 – Likuiditeti Makroekonomik (M2): Ky është "motori primar" kur M2 rritet globalisht, kapitali kërkon aktive alternative dhe Bitcoin-i absorbon pjesën e tij.
- Shtresa 3 – Kërkesa Institucionale (ETF): Ky është "amplifikuesi" konverton kapitalin makroekonomik në blerje strukturore, duke reduktuar volatilitetin dhe prolonguar ciklin.

6. SFIDAT DHE ANALIZA E RREZIQEVE

Ndonëse trajektoria e maturimit duket e qartë, rruga drejt stabilizimit të plotë të Bitcoin-it si "Ar Dixhital" nuk është pa rreziqe materiale. Ky kapitull analizon sfidat kryesore strukturore.

6.1 Centralizimi i Minimit: Sfida e Decentralizimit

Hallka e Akilit e modelit ekonomik të Bitcoin-it mund të jetë minatorët. Pas çdo Halving, profitabiliteti i minimit ulet ndjeshëm shpërblimet më të ulëta i lënë vetëm operatorët e mëdhenj, efiçentë dhe kapitalizuar mirë fitimprurës. Ky fenomen rrezikon centralizimin e procesit të minatit:

- Rreziku i 51% Attack: Nëse shumë shumë fuqi minuese (hashrate) përqendrohet tek pak aktorë (p.sh., 3-4 kompani të mëdha publike amerikane), rrjeti bëhet teorikisht vulnerabël ndaj sulmeve. Megjithëse kjo mbetet e kushtueshme ekonomikisht, rreziku ekziston.
- Rreziku Ekzistencial afatgjatë: Dizajni i Bitcoin-it parashikon që, kur emisionet e reja të arrijnë zero (rreth vitit 2140), minatorët do të financohen vetëm nga tarifat e transaksioneve (transaction fees). Nëse këto tarifa nuk janë mjaft të larta, stimulli ekonomik për minimin mund të bjerë, duke minuar sigurinë e rrjetit.
- Impakti Mjedisor: Kosto energjetike e minimit ka ngjallur kritika globale. Ndonëse pjesa e energjisë rinovueshme po rritet (raportet tregojnë mbi 50% energji të pastër), ky debate mbetet sensibil politikisht dhe mund të influencojë rregulloret.

6.2 Rregullimi Ligjor: Korniza MiCA dhe Implikimet Globale

Viti 2024 shënoi zbatimin e plotë të MiCA (Markets in Crypto-Assets) rregullores më gjithëpërfshirëse të aseteve digjitale të miratuar ndonjëherë nga Bashkimi Europian. MiCA krijon një kornizë harmonizuese për 27 vendet anëtare, duke synuar mbrojtjen e konsumatorëve, parandalimin e abuzimit të tregut dhe stabilitetin financiar.

Pasojat janë dykahore. Nga njëra anë, MiCA legjitimoi agjentët e tregut dhe ofroi qartësi ligjore duke hapur dyert për institucione europiane konservative (si fondet e pensioneve) që kishin

frikë të ekspozoheshin ndaj aseteve pa mbulim rregullator. Nga ana tjetër, vendos barriera hyrjeje (compliance costs) që favorizojnë operatorët e mëdhenj mbi ata të vegjël dhe inovatorët startup, duke potencialisht ngushtuar konkurrencën.

Sfida globale e rregullimit mbetet asimetria: ndërsa BE-ja ka MiCA-n, dhe SHBA-ja ka ETF-të, vende si Kina kanë ndaluar plotësisht tregtimin e Bitcoin-it. Kjo asimetri gjeopolitike krijon arbitrazh rregullator flukse kapitali të ndikuara nga klima rregullatore, jo vetëm nga bazat e tregut.

Rreziqet e identifikuara nga pikëpamja rregullatore includin: ndryshime të rregullave tatimore (Capital Gains Tax), kërkesat e KYC/AML (Know Your Customer / Anti-Money Laundering) që mund të ndikojnë privacitetin, dhe mundësia e sanksioneve ndaj exchange-ve të mëdha (si precedenti i Binance me DOJ-n amerikane).

7. PERFUNDIME

Ky studim ka naviguar nëpër tre pyetje themelore ndërkomunikuese: Çfarë e nxën çmimin e Bitcoin-it? Si po ndryshon tregu? Dhe ku shkon Bitcoin-i si aset?

Gjetja kryesore e punimit mund të formulohet kështu: Halving mbetet "shtylla kurrizore" e modelit ekonomik të Bitcoin-it mekanizmi i programuar i rrallësisë që ofron bazën fundamentale dhe narrativën psikologjike. Por motori primar i cikleve kulmike të çmimit ka evoluar: nuk është më vetëm "shoku" i ofertës nga Halving, por sinergjia midis likuiditetit makroekonomik (M2) dhe absorbimit struktural nga kapitalet institucionale (ETF-të).

7.1 Teoria e Left-Translated Cycle dhe Implikacionet

Bazuar në analizën e prezantuar, ky punim argumenton për "Left-Translated Cycle" si skenari bazë për Ciklin 4 (2024-2028). Kjo teori sugjeron se kulmi i çmimit mund të vijë relativisht herët pas Halvingut jo 18 muaj më vonë si historikisht – për arsye strukturore: investitorët institucionalë me akses në informacion superior shpesh pozicionohen para ngjarjeve të parashikueshme si Halving, duke "front-run" ciklin tradicional.

Pasoja praktike e Left-Translated Cycle është ajo që analistët quajnë "supercycle" një skenar ku rritja pas Halvingut të vitit 2024 nuk pasojnë nga rënia masive tradicionale ("bear market" i -77% ose -84%), por nga konsolidim dhe cikël i ri rritjeje relativisht i shpejtë. Kjo do t'i ngjante funksionimit të arit pas vitit 2008: rritje graduale, konstante, me volatilitet të reduktuar.

7.2 Bitcoin si "Ar Dixhital": Tranzicioni i Asetit

Evidenca e grumbulluar sugjeron fort se Bitcoin-i po kalon nëpër tranzicionin nga "aktiv spekulativ i egër" (2009-2020) drejt "asetit rezervë korporativ dhe institucional" (2024 e tutje). Tre treguesit kryesorë të këtij tranzicioni janë:

- Adoptimi Korporativ: Kompani si MicroStrategy, Tesla dhe Square kanë integruar Bitcoin-in si rezervë korporative, duke ndjekur logjikën e "treasury hedge" kundër inflacionit.
- Legitimizimi Institucional: Aprovimi i ETF-ve nga SEC, inkorporimi në portofolin e firmave si Goldman Sachs dhe Morgan Stanley, dhe diskutimet mbi "Strategic Bitcoin Reserve" në nivel shtetëror (p.sh., propozimi i El Salvador dhe debati amerikan).
- Maturimi Metrikal: Reduktimi i drawdown-it maksimal nga -93% (2012) në vlera të parashikuara nën -55% (2024+), rritja e HODL-wave-s, dhe thellimi i tregut janë tregues sasisorë të maturimit struktural.

7.3 Kufizimet dhe Hulumtimet e Ardhshme

Ky studim pranon kufizimet e tij. Analiza e cikleve Bitcoin-it vuan nga "campione të vogla" – me vetëm katër Halving-e të dokumentuara, ekstrapolimi statistikor është i kufizuar. Gjithashtu, efektet e plota të ETF-ve institucionale janë të panjohura, pasi ky fenomen është thelbësisht i ri.

Hulumtimet e ardhshme duhet të fokusohen në: ndërtimin e modeleve sasiore të integrimit M2 + ETF + Halving; analizën e ndikimit të CBDC-ve (Central Bank Digital Currencies) si konkurrencë potenciale ndaj Bitcoin-it; dhe studimin krahasues ndërkombëtar të ndikimit të kornizave rregullatore të ndryshme mbi adoptimin e Bitcoin-it.

Në mbyllje, ky punim konkludon se Bitcoin-i ka mbajtur premtimin e tij thelbësor: të jetë "para pa leje", me politikë monetare të paracaktuar dhe transparente. Transformimi që po ndodh nuk e mohon këtë premtim ai e zgjeronë. Hyrja e institucioneve nuk është kolonizimi i Bitcoin-it nga Wall Street, por njohja e Wall Street-it se rregullat e reja monetare janë shkruar jo nga bankierët centralë, por nga algoritmet.

Readiness of preschool education teachers for digital transformation: The need for training and supportive policies

Evina Bajrami

Directorate of Kindergartens and Nurseries, Tirana Municipality

Abstract

Digital transformation and artificial intelligence are profoundly reshaping education systems around the world, bringing new challenges and opportunities to early childhood education as well. This paper aims to explore, through a theoretical and conceptual analysis of the scientific literature, the level of readiness of preschool education teachers to meet the demands of the digital age and the impact of technology on pedagogical practice. The central research question of the paper is: What digital competencies are necessary for preschool education teachers, and what supportive policies are required for their professional development in the context of digital transformation? The methodology of the paper is based on a critical review of scientific literature and education policy documents, as well as on reflection upon professional practice in the field of preschool education. The paper argues that educators occupy a central role in shaping generations that will grow up in a digitalized environment, and therefore their digital readiness is not an option, but a necessity. The analysis identifies existing gaps in the current framework of professional development for educators in Albania, particularly with regard to the pedagogical use of technology and artificial intelligence. In conclusion, the paper proposes several key recommendations, including the development of a national digital competency framework for preschool education, the integration of educational technology into initial and continuing training programs, and the strengthening of institutional support for the professional development of educators.

Keywords: *digital transformation, preschool education, digital competence, professional training, education policy*

1. Hyrje

Shekulli XXI karakterizohet nga një transformim i thellë digjital që prek çdo aspekt të jetës shoqërore, ekonomike dhe kulturore. Inteligjenca artificiale, automatizimi dhe teknologjitë e reja digjitale po riformësojnë mënyrën se si njeriu mëson, punon dhe ndërvepron. Ky transformim nuk lë jashtë as sistemin arsimor, madje, arsimi paraqitet si një nga sektorët ku ndikimi i digjitalizimit është njëkohësisht më i rëndësishëm dhe më kompleks (OECD, 2023).

Arsimi parashkollor zë një vend të veçantë në këtë kontekst. Fëmijët e sotëm rriten në mjedise të digjitalizuara nga mosha më e hershme, duke u ekspozuar ndaj ekraneve, aplikacioneve dhe mjeteve digjitale edhe para se të hyjnë në institucionet arsimore (Masoumi & Bourbour, 2024). Ky realitet kërkon që mësueset e arsimit parashkollor të jenë jo vetëm të familjarizuara me teknologjinë, por edhe të aftë ta integrojnë atë me mençuri pedagogjike në procesin mësimor.

Megjithatë, hulumtimet ndërkombëtare tregojnë se ekziston një mangësi e ndjeshme midis kërkesave të epokës digjitale dhe nivelit aktual të kompetencave digjitale të edukatorëve parashkollorë (Su & Yang, 2023; SWK, 2022). Kjo mangësi është edhe më theksuar në kontekstin e vendeve në zhvillim, si Shqipëria, ku infrastruktura digjitale arsimore dhe programet e trajnimit profesional mbeten të kufizuara (ASCAP, 2024).

Ky punim synon të kontribuojë duke analizuar nëpërmjet një qasjeje teorike dhe konceptuale sa të gatshëm janë mësuesit e arsimit parashkollor në Shqipëri dhe duke propozuar rekomandime konkrete për politikat arsimore. Rëndësia e temës vjen edhe nga fakti se mësueset e arsimit

parashkollor janë aktorë kyçë në formimin e kompetencave të hershme të fëmijëve, kompetenca këto që do t'i shoqërojnë ata gjatë gjithë jetës.

2. Rishikimi i literaturës

2.1 Kompetencat digjitale të edukatoreve (Kuadri ndërkombëtar)

Koncepti i kompetencës digjitale të edukatoreve ka marrë vëmendje gjithnjë e më të madhe në nivel ndërkombëtar. Kuadri evropian DigCompEdu (Redecker, 2017) përbën referencën kryesore në këtë fushë, duke përshkruar 22 kompetenca të organizuara në gjashtë fusha: angazhimi profesional, burimet digjitale, mësimdhënia dhe të nxënit, vlerësimi, fuqizimi i nxënësve dhe nxitja e kompetencës digjitale të nxënësve. Ky kuadër zbatohet për edukatoret në të gjitha nivelet arsimore, duke përfshirë edhe arsimin parashkollor.

Në mënyrë plotësuese, DigComp 2.2 (Vuorikari et al., 2022) ofron një kuadër të rëndësishëm për të kuptuar kompetencën digjitale si ndërthurje të njohurive, aftësive dhe qëndrimeve të nevojshme për përdorimin e sigurt, kritik dhe të përgjegjshëm të teknologjisë digjitale. Edhe pse ky kuadër i referohet qytetarëve në përgjithësi, ai ndihmon në kuptimin e bazës së kompetencave digjitale që duhet të zhvillojnë edhe mësueset e arsimit parashkollor. UNESCO UNEVOC ofron gjithashtu një bazë të dhënash globale të kuadreve të kompetencave digjitale për mësues, nxënës dhe qytetarë, duke treguar se këto kompetenca duhet të përshtaten sipas kontekstit arsimor dhe kombëtar.

Në kontekstin gjerman, SWK (2022) ka hartuar rekomandime gjithëpërfshirëse për digjitalizimin e sistemit arsimor nga kopshti deri në universitet, duke theksuar se trajnimi i vazhdueshëm për tema digjitale është tepër i nevojshëm. Stiftung Kinder forschen (2023) ka propozuar një "Digitalpakt Kita" me katër kërkesa qendrore: kualifikim profesional, akses në teknologji, pjesëmarrje e hershme dhe mbështetje institucionale.

2.2 Kompetenca digjitale në arsimin parashkollor

Rishikimi sistematik i literaturës nga Su dhe Yang (2023) i cili analizoi 23 studime shkencore mbi kompetencën digjitale në arsimin parashkollor (2012–2022) zbulon se shumica e studimeve fokusohen tek mësuesit dhe synojnë vlerësimin e arritjeve dhe pikëpamjeve të tyre mbi kompetencën digjitale.

Masoumi dhe Bourbour (2024), identifikojnë shtatë dimensione të kompetencës digjitale të përshtatshme për fëmijët në arsimin parashkollor: njohja me teknologjitë digjitale, guximi për t'i provuar ato, aftësia për t'i përdorur, qasja kritike, kompetenca etike në përdorimin e medias, aftësia për zgjidhjen e problemeve dhe roli aktiv i fëmijës si krijues, jo vetëm si konsumator i teknologjisë. Studimi, i realizuar me 13 mësuese parashkollore në Suedi, tregon se kompetenca digjitale në arsimin parashkollor nuk kufizohet te aftësitë teknike, por përfshin edhe dimensione etike, sociale, kritike dhe pedagogjike.Merjovaara dhe bashkëautorët (2024) tregojnë se edukatoret kanë qëndrim pozitiv ndaj përdorimit të mjeteve digjitale, por kjo nuk do të thotë gjithmonë se ato ndihen të afta t'i përdorin mirë në praktikë. Pra, problemi kryesor është ky: edukatoret mund të jenë të hapura ndaj teknologjisë, por mund të mos kenë ende aftësitë e nevojshme për ta përdorur atë në mënyrë efektive me fëmijët.

Diković dhe Terlević (2025) theksojnë se edukatoret nuk duhet të mësojnë vetëm si përdoren pajisjet digjitale, por edhe si t'i përdorin ato në mënyrë të dobishme gjatë punës me fëmijët. Prandaj, teknologjia duhet të jetë pjesë e rëndësishme e përgatitjes së tyre profesionale.

2.3 Konteksti shqiptar

Sistemi arsimor shqiptar ndodhet në një fazë të rëndësishme zhvillimi, ku përmirësimi i cilësisë së arsimit, digjitalizimi i proceseve mësimore dhe zhvillimi profesional i mësuesve janë kthyer në prioritete kryesore të politikave arsimore. Sipas Raportit të Vlerësimit të Performancës së Sistemit Arsimor Parauniversitar për vitin 2024, vizioni i Ministrisë së Arsimit dhe Sportit synon ndërtimin e një sistemi arsimor cilësor, gjithëpërfshirës dhe të orientuar drejt të mësuarit gjatë gjithë jetës, në përputhje me objektivat evropiane të arsimit dhe formimit. Në këtë kuadër, një nga objektivat specifikë të Strategjisë Kombëtare të Arsimit është zhvillimi i kompetencës digjitale përmes përdorimit më të mirë të teknologjisë së informacionit dhe komunikimit në mësimdhënie dhe të nxënë. Raporti i ASCAP për vitin 2024 evidenton një përmirësim të përgjithshëm të performancës së sistemit arsimor parauniversitar, ku indeksi i vlerësimit është rritur nga 4.05 në vitin 2023 në 4.43 në vitin 2024. Ky progres tregon se sistemi ka bërë hapa pozitivë në drejtim të planifikimit, koordinimit institucional dhe përmirësimit të cilësisë, por njëkohësisht nënvizon nevojën për të vazhduar investimet në fusha kyçe si digjitalizimi, infrastruktura teknologjike dhe zhvillimi profesional i mësuesve. Roli i ASCAP është veçanërisht i rëndësishëm, pasi agjencia është përgjegjëse për vlerësimin e performancës së sistemit arsimor, hartimin e kurrikulës, zhvillimin profesional të mësuesve dhe sigurimin e cilësisë në arsimin parauniversitar. Kjo e vendos zhvillimin profesional të mësuesve në qendër të përpjekjeve për rritjen e cilësisë së arsimit dhe për përshtatjen e shkollës shqiptare me kërkesat e reja të mësimdhënies bashkëkohore. Një drejtim i rëndësishëm i reformave lidhet me formimin dhe kualifikimin e mësuesve. Raporti i ASCAP thekson se skema e re e kualifikimit të mësuesve synon një proces më të shpejtë, më transparent dhe të bazuar në meritokraci. Gjithashtu, zhvillimi profesional i mësuesve paraqitet si një fushë me përparime të rëndësishme, ku Programi Kombëtar i Zhvillimit Profesional për vitet 2024 dhe 2025, në bashkëpunim me universitetet publike që formojnë mësues, përfaqëson një hap të rëndësishëm drejt rritjes së cilësisë së trajnimeve. Deri në fund të vitit 2024 janë trajnuar 16,045 mësues për përdorimin e metodave inovative në mësimdhënie. Digjitalizimi i arsimit mbetet një nga sfidat dhe njëkohësisht një nga mundësitë kryesore për modernizimin e sistemit. ASCAP raporton se infrastruktura TIK në arsimin parauniversitar ka shënuar përparime të rëndësishme, por ende përballet me sfida në arritjen e objektivave të vitit 2026. Në kuadër të procesit të digjitalizimit janë ndërtuar 100 SmartLabs me mbështetjen e projektit Element IT dhe 216 SmartLabs përmes projektit GovTech të financuar nga Banka Botërore, ndërsa parashikohet ndërtimi i 645 SmartLabs të tjera me mbështetjen e Bankës Qendrore Evropiane. Qëllimi kryesor i këtyre laboratorëve është përmirësimi i cilësisë së mësimdhënies dhe mësimnxënies përmes integrimit të teknologjive të reja në kurrikulën shkollore. Përveç infrastrukturës, zhvillimi i kompetencës digjitale kërkon edhe përgatitje të qëndrueshme profesionale të mësuesve. Teknologjia në vetvete nuk garanton përmirësim të cilësisë së arsimit, nëse nuk shoqërohet me aftësi pedagogjike, metodologji bashkëkohore dhe përdorim efektiv të mjeteve digjitale në procesin mësimor. Për këtë arsye, trajnimi i mësuesve për përdorimin e teknologjisë, mësimdhënien e kombinuar dhe ndërtimin e përvojave të të nxënit të përshtatura me nevojat e fëmijëve është thelbësor për suksesin e digjitalizimit në arsim. Ky aspekt merr rëndësi të veçantë në arsimin parashkollor, ku ndërhyrjet pedagogjike ndikojnë drejtpërdrejt në zhvillimin e hershëm të fëmijëve. Sipas të dhënave të INSTAT, në vitin shkollor 2023 deri 2024, në arsimin parashkollor shqiptar u regjistruan 66,711 fëmijë. Kjo shifër tregon peshën e rëndësishme të këtij niveli arsimor dhe nevojën për të mbështetur mësueset parashkollore me trajnime cilësore, burime digjitale të përshtatura dhe modele të reja të mësimdhënies që respektojnë moshën, ritmin e zhvillimit dhe nevojat individuale të fëmijëve. Në arsimin parashkollor, digjitalizimi nuk duhet kuptuar thjesht si përdorim i pajisjeve teknologjike në klasë, por si një qasje pedagogjike që ndihmon në pasurimin e përvojave të të nxënit, në nxitjen e kreativitetit, komunikimit, bashkëpunimit dhe aftësive fillestare digjitale. Për këtë arsye, përgatitja digjitale e mësueseve

parashkollore kërkon vëmendje të veçantë nga politikëbërësit, institucionet e trajnimit dhe strukturat përgjegjëse për sigurimin e cilësisë në arsim.

Konteksti shqiptar tregon se sistemi arsimor ka hyrë në një fazë të re modernizimi, ku cilësia e arsimit lidhet ngushtë me zhvillimin profesional të mësuesve, digjitalizimin, përdorimin e të dhënave dhe përmirësimin e praktikave pedagogjike. Megjithatë, për të siguruar që këto reforma të kenë ndikim të qëndrueshëm, është e nevojshme që investimet në teknologji të shoqërohen me trajnim të vazhdueshëm, mbështetje institucionale dhe vlerësim të rregullt të nevojave profesionale të mësuesve, veçanërisht në arsimin parashkollor.

3. Metodologjia

Ky punim mbështetet në një metodologji cilësore të bazuar në rishikimin kritik të literaturës shkencore (systematic/narrative literature revieë). Kjo qasje është zgjedhur për arsye se objektivi i punimit nuk është gjenerimi i të dhënave të reja empirike, por sinteza dhe interpretimi kritik i njohurive ekzistuese shkencore në funksion të kontekstit shqiptar.

Burimet e analizuara përfshijnë: (1) artikuj shkencorë dhe studime të botuara në revista, platforma dhe institucione akademike ndërkombëtare gjatë periudhës 2017–2025, me fokus në kompetencën digjitale të edukatorëve parashkollorë; (2) dokumente të politikave arsimore nga institucione ndërkombëtare si Komisioni Europian, OECD dhe UNESCO; (3) studime dhe raporte nga konteksti gjerman, si SWK, WIFF, Stiftung Kinder forschen dhe BMBF; si dhe (4) raporte dhe të dhëna statistikore nga institucione shqiptare, si ASCAP, INSTAT dhe MASh.

Burimet u analizuan mbi bazën e tre kritereve kryesore: përshtatshmëria me temën e kompetencës digjitale të edukatorëve parashkollorë, aktualiteti i tyre, me përparësi studimet e periudhës 2020–2025, dhe larmia e perspektivave gjeografike e metodologjike. Sinteza e gjetjeve u realizua duke lidhur literaturën ndërkombëtare me një reflektim kritik mbi kontekstin shqiptar të arsimit parashkollor.

4. Analiza dhe diskutimi

4.1 Mangësitë e kompetencës digjitale

Analiza e literaturës tregon se ekziston një hendek i dukshëm midis nivelit të kompetencës digjitale që kërkohet sot nga mësueset e arsimit parashkollor dhe nivelit që ato zotërojnë aktualisht. Ky hendek është i pranishëm si në vendet me sisteme më të zhvilluara arsimore, ashtu edhe në vende ku digjitalizimi i arsimit është ende në fazë zhvillimi, siç është edhe rasti i Shqipërisë. Problemi nuk lidhet vetëm me mungesën e pajisjeve teknologjike, por edhe me mënyrën se si mësueset përgatiten, mbështeten dhe inkurajohen për ta përdorur teknologjinë në mënyrë pedagogjike.

Një nga mangësitë kryesore lidhet me dimensionin teknik të kompetencës digjitale. Një pjesë e mësueseve të arsimit parashkollor nuk zotërojnë ende aftësitë bazë për përdorimin e mjeteve digjitale, platformave mësimore, burimeve online dhe aplikacioneve të thjeshta edukative. Kjo përfshin vështirësi në përdorimin e pajisjeve teknologjike, në përzgjedhjen e materialeve digjitale të përshtatshme, në krijimin e përmbajtjeve të thjeshta mësimore dhe në përdorimin e teknologjisë për komunikim profesional me prindërit ose kolegët. Sipas WiFF, ofertat e trajnimit të vazhdueshëm në fushën e edukimit digjital në Gjermani janë ende të kufizuara dhe jo gjithmonë të koordinuara mirë. Në kontekstin shqiptar, kjo sfidë bëhet edhe më e ndjeshme për shkak të kufizimeve në infrastrukturë, mungesës së pajisjeve në disa institucione parashkollore dhe nevojës për programe më të strukturuara të trajnimit profesional.

Mangësi e rëndësishme lidhet me dimensionin pedagogjik. Edhe kur mësueset kanë aftësi bazë teknike, ato shpesh nuk janë të sigurta se si ta integrojnë teknologjinë në mënyrë kuptimplotë në aktivitetet e përditshme me fëmijët. Në arsimin parashkollor, përdorimi i teknologjisë nuk mund të jetë i njëjtë si në nivelet më të larta të arsimit. Fëmijët e vegjël mësojnë kryesisht përmes lojës, ndërveprimit, eksplorimit, lëvizjes dhe komunikimit. Për këtë arsye, teknologjia duhet të përdoret si mjet mbështetës, jo si zëvendësim i përvojave konkrete dhe ndërveprimit njerëzor. Knauf thekson se edukimi digjital në fëmijërinë e hershme nuk duhet të mbështetet vetëm në module të strukturuara, por duhet të integrohet në mënyrë të natyrshme në aktivitetet e përditshme të fëmijëve. Kjo kërkon nga mësueset aftësi për të planifikuar veprimtari të përshtatshme, për të zgjedhur mjete digjitale me vlerë pedagogjike dhe për të krijuar një balancë të shëndetshme midis përvojave digjitale dhe atyre fizike.

Një tjetër mangësi lidhet me qëndrimet ndaj teknologjisë. Studimet tregojnë se mësueset e arsimit parashkollor kanë qëndrime të ndryshme ndaj përdorimit të mjeteve digjitale. Disa prej tyre e shohin teknologjinë si mundësi për të pasuruar mësimdhënien, për të nxitur kreativitetin dhe për të përmirësuar komunikimin me fëmijët dhe prindërit. Të tjera janë më skeptike, sepse e lidhin teknologjinë me rrezikun e ekspozimit të tepërt ndaj ekranit, uljen e ndërveprimit social ose largimin nga loja tradicionale. Simon dhe bashkëautorët theksojnë se qëndrimet e mësueseve ndaj mediave digjitale ndikohen nga përvojat personale, bindjet pedagogjike, niveli i njohurive dhe kultura institucionale ku ato punojnë.

Këto qëndrime janë veçanërisht të rëndësishme, sepse ndikojnë drejtpërdrejt në mënyrën se si teknologjia përdoret në klasë. Një mësuese që ka qëndrim pozitiv, por nuk ka aftësi të mjaftueshme pedagogjike, mund ta përdorë teknologjinë në mënyrë sipërfaqësore. Nga ana tjetër, një mësuese që ka njohuri teknike, por ka qëndrim negativ ndaj teknologjisë, mund të shmangë përdorimin e saj edhe kur ajo do të ishte e dobishme. Për këtë arsye, zhvillimi i kompetencës digjitale nuk duhet të kufizohet vetëm te trajnimi teknik, por duhet të përfshijë edhe reflektimin profesional mbi rolin e teknologjisë në zhvillimin e fëmijëve.

Mangësitë e kompetencës digjitale janë shumëdimensionale. Ato lidhen me aftësitë teknike, me njohuritë pedagogjike, me qëndrimet profesionale, me kulturën institucionale dhe me mundësitë konkrete që kanë mësueset për të praktikuar përdorimin e teknologjisë. Prandaj, çdo politikë ose program trajnimi që synon të përmirësojë kompetencën digjitale të mësueseve parashkollore duhet të marrë parasysh të gjitha këto dimensione.

4.2 Faktorët që ndikojnë në gatishmërinë digjitale

Gatishmëria digjitale e mësueseve të arsimit parashkollor ndikohet nga një sërë faktorësh të ndërlidhur. Këta faktorë përfshijnë formimin fillestar, trajnimin e vazhdueshëm, mbështetjen institucionale, infrastrukturën teknologjike, kulturën organizative dhe politikat arsimore. Literatura tregon se nuk mjafton që mësueset të kenë akses në teknologji. Ato duhet të kenë edhe njohuritë, besimin profesional dhe mbështetjen e nevojshme për ta përdorur atë në mënyrë të përshtatshme dhe të qëndrueshme.

Faktori i parë: Formimi fillestar i mësueseve. Programet universitare që përgatisin mësueset e arsimit parashkollor kanë ndikim të madh në mënyrën se si ato e kuptojnë rolin e teknologjisë në procesin edukativ. Nëse kompetenca digjitale nuk trajtohet në mënyrë të plotë gjatë formimit fillestar, mësueset e reja hyjnë në profesion me pasiguri dhe me njohuri të kufizuara për përdorimin pedagogjik të teknologjisë. Diković dhe Terlević theksojnë se përfshirja e teknologjisë së informacionit, mediave digjitale dhe mjeteve të inteligjencës artificiale në programet universitare të formimit të mësueseve parashkollore mbetet ende e pamjaftueshme në shumë vende europiane. Kjo tregon se problemi nuk është vetëm shqiptar, por pjesë e një sfidë më të gjerë në edukimin e hershëm.

Faktori i dytë: Trajnimi i vazhdueshëm në punë. Për shkak se teknologjia ndryshon shpejt, mësueset kanë nevojë për zhvillim profesional të vazhdueshëm, praktik dhe të lidhur me realitetin e punës së tyre. Trajnimet e shkurtra dhe teorike shpesh nuk arrijnë të krijojnë ndryshim të qëndrueshëm në praktikën pedagogjike. Projekti DiKit në Gjermani tregon se trajnimet më efektive janë ato që ndërthurin aftësitë teknike me reflektimin pedagogjik, diskutimin mbi qëndrimet personale dhe zbatimin praktik në institucion. Simon, Stolakis dhe bashkëautorët argumentojnë se mësueset kanë nevojë për kohë, mbështetje dhe hapësirë për të eksperimentuar me teknologjinë, për të reflektuar mbi përvojën dhe për të ndërtuar besim profesional.

Faktori i tretë: Mbështetja institucionale. Një mësuese mund të ketë motivim dhe njohuri, por nëse institucioni ku punon nuk ka pajisje, internet, materiale digjitale ose kulturë mbështetëse, përdorimi i teknologjisë mbetet i kufizuar. OECD thekson se vetëm prania e teknologjisë në institucionet arsimore nuk garanton përmirësim të të nxënit. Pajisjet digjitale japin rezultat vetëm kur përdoren nga mësues të trajnuar dhe kur integrohen në një qasje pedagogjike të qartë. Kjo do të thotë se infrastruktura dhe trajnimi duhet të zhvillohen së bashku.

Në këtë drejtim, modeli "Digitalpakt Kita", i propozuar nga Stiftung Kinder forschen, ofron një qasje të dobishme për vendet që kërkojnë të forcojnë kompetencën digjitale në arsimin parashkollor. Ky model nuk fokusohet vetëm te blerja e pajisjeve teknologjike, por kombinon financimin, trajnimin e mësueseve, mbështetjen institucionale dhe zhvillimin e materialeve cilësore. Një qasje e tillë është e rëndësishme edhe për Shqipërinë, sepse tregon se digjitalizimi i suksesshëm nuk mund të arrihet përmes masave të veçuara, por kërkon strategji të integruar.

Faktori i katërt: Kultura profesionale brenda institucioneve parashkollore. Nëse drejtuesit e kopshteve e mbështesin përdorimin e teknologjisë dhe krijojnë mundësi për bashkëpunim mes mësueseve, atëherë rritet edhe mundësia që teknologjia të përdoret në mënyrë më cilësore. Përkundrazi, nëse përdorimi i teknologjisë shihet si detyrë shtesë ose si përgjegjësi individuale e mësueses, atëherë procesi bëhet më i vështirë. Për këtë arsye, lidershipi institucional luan rol të rëndësishëm në nxitjen e inovacionit, në krijimin e klimës bashkëpunuese dhe në mbështetjen e zhvillimit profesional.

Po ashtu, gatishmëria digjitale ndikohet edhe nga politikat publike dhe nga mënyra se si ato zbatohen në praktikë. Strategjitë kombëtare mund të vendosin objektiva të rëndësishme për digjitalizimin, por ndikimi i tyre varet nga zbatimi konkret në nivel institucioni. Nëse politikat nuk shoqërohen me fonde, udhëzime, trajnime dhe mekanizma monitorimi, ato rrezikojnë të mbeten në nivel deklarativ. Për këtë arsye, është e rëndësishme që politikat për digjitalizimin e arsimit të shoqërohen me plane konkrete për arsimin parashkollor, pasi ky nivel ka nevoja dhe specifika të ndryshme nga arsimi fillor ose i mesëm.

Theksojmë se, gatishmëria digjitale e mësueseve parashkollore nuk varet nga një faktor i vetëm. Ajo është rezultat i ndërveprimit midis formimit fillestar, trajnimit të vazhdueshëm, mbështetjes institucionale, infrastrukturës, qëndrimeve profesionale dhe politikave arsimore. Prandaj, përmirësimi i saj kërkon ndërhyrje të koordinuara dhe afatgjata.

4.3 Zbatimi në kontekstin shqiptar

Konteksti shqiptar paraqet disa veçori të rëndësishme që duhen marrë parasysh në analizën e kompetencës digjitale të mësueseve të arsimit parashkollor. Shqipëria ka ndërmarrë hapa drejt digjitalizimit të arsimit dhe përfshirjes së kompetencave digjitale në dokumentet kurrikulare dhe strategjike. Megjithatë, zbatimi i këtyre politikave në praktikë mbetet ende i pabarabartë dhe jo gjithmonë i mjaftueshëm, veçanërisht në arsimin parashkollor.

Nga njëra anë, dokumentet kombëtare të arsimit e njohin rëndësinë e kompetencës digjitale si pjesë e formimit të nxënësve dhe mësuesve. Ministria e Arsimit dhe Sportit ka përfshirë kompetencat digjitale në kurrikulën e arsimit parauniversitar, duke e konsideruar përdorimin e teknologjisë si pjesë të aftësive të nevojshme për qytetarinë, të nxënit dhe zhvillimin profesional. Nga ana tjetër, raportet kombëtare mbi performancën e sistemit arsimor tregojnë se digjitalizimi mbetet një fushë ku nevojiten përmirësime të mëtejshme. Kufizimet në infrastrukturë, mungesa e trajnimeve të specializuara dhe niveli i ndryshëm i përgatitjes së mësueseve e bëjnë zbatimin e politikave më kompleks.

Në arsimin parashkollor, këto sfida janë edhe më të ndjeshme. Kopshtet dhe çerdhet kanë funksion edukativ, zhvillimor dhe social. Për këtë arsye, përdorimi i teknologjisë duhet të jetë shumë i kujdesshëm, i moderuar dhe i përshtatur me moshën e fëmijëve. Teknologjia nuk duhet të përdoret si qëllim në vetvete, por si mjet për të pasuruar aktivitetet, për të nxitur kureshtjen, për të zhvilluar kreativitetin dhe për të mbështetur komunikimin. Kjo kërkon mësuese të përgatitura jo vetëm teknikisht, por edhe pedagogjikisht.

Shqipëria mund të marrë shembull nga përvojat europiane, duke përshtatur modele si DigCompEdu me realitetin vendas. DigCompEdu ofron një kornizë të qartë për kompetencën digjitale të edukatorëve, duke përfshirë fusha të tilla si angazhimi profesional, përdorimi i burimeve digjitale, mësimdhënia dhe të nxënit, vlerësimi, fuqizimi i nxënësve dhe zhvillimi i kompetencës digjitale të tyre. Megjithatë, ky model nuk mund të zbatohet në mënyrë të njëjtë në çdo vend. Në rastin shqiptar, ai duhet të përshtatet me nivelin e infrastrukturës, me formimin aktual të mësueseve, me burimet që kanë në dispozicion kopshtet dhe me kulturën pedagogjike të arsimit parashkollor.

Një drejtim i rëndësishëm për zbatimin në Shqipëri është zhvillimi i programeve të trajnimit të posaçme për mësueset e arsimit parashkollor. Këto programe duhet të jenë praktike, të lidhura me situatat reale të punës dhe të fokusuara në përdorimin pedagogjik të teknologjisë. Në vend që trajnimi të kufizohet vetëm te përdorimi teknik i pajisjeve, ai duhet të përfshijë shembuj konkretë të aktiviteteve me fëmijët, mënyra për të përzgjedhur burime digjitale të sigurta, strategji për komunikimin me prindërit dhe reflektim mbi balancën midis lojës fizike dhe përvojave digjitale.

Një tjetër drejtim i rëndësishëm është forcimi i bashkëpunimit institucional. Institucione si ASCAP, Akademia e Pushtetit Vendor, universitetet që formojnë mësues, bashkitë dhe strukturat përgjegjëse për kopshtet dhe çerdhet mund të luajnë rol të rëndësishëm në ndërtimin e një sistemi më të qëndrueshëm të zhvillimit profesional. Ky bashkëpunim mund të ndihmojë në hartimin e standardeve të trajnimit, në identifikimin e nevojave të mësueseve, në zhvillimin e moduleve praktike dhe në monitorimin e ndikimit të trajnimeve në praktikën e përditshme.

Në kontekstin shqiptar, rëndësi të veçantë ka edhe vlerësimi i nevojave reale të mësueseve. Para se të hartohen programe trajnimi, është e nevojshme të kuptohet niveli aktual i kompetencës digjitale, qëndrimet e mësueseve ndaj teknologjisë, lloji i pajisjeve që kanë në dispozicion dhe vështirësitë që hasin në punën e përditshme. Një analizë e tillë do të ndihmonte në krijimin e trajnimeve më të sakta dhe më efektive.

Po ashtu, duhet pasur parasysh se digjitalizimi në arsimin parashkollor nuk duhet të matet vetëm me numrin e pajisjeve teknologjike. Një kopsht mund të ketë pajisje, por nëse mësueset nuk janë të trajnuara dhe nuk kanë mbështetje pedagogjike, ndikimi në cilësinë e të nxënit do të jetë i kufizuar. Për këtë arsye, investimi në teknologji duhet të shoqërohet me investim në burime njerëzore, në zhvillim profesional dhe në udhëzime të qarta për përdorimin e teknologjisë me fëmijët e vegjël.

Zbatimi i kompetencës digjitale në kontekstin shqiptar kërkon një qasje të kujdesshme, të përshtatur dhe të qëndrueshme. Shqipëria ka tashmë një bazë politike dhe institucionale për të

avancuar në këtë drejtim, por nevojitet forcim i zbatimit në praktikë. Prioritet duhet të jetë zhvillimi profesional i mësueseve parashkollore, përmirësimi i infrastrukturës, krijimi i moduleve të specializuara të trajnimit dhe ndërtimi i një kulture institucionale që e sheh teknologjinë si mjet për të përmirësuar cilësinë e edukimit, jo si zëvendësim të ndërveprimit njerëzor dhe lojës.

5. Konkluzione

Ky punim argumentoi se transformimi digjital dhe inteligjenca artificiale paraqesin sfida dhe mundësi konkrete për arsimin parashkollor dhe për mësueset e tij. Analiza e literaturës shkencore ndërkombëtare, e kuadreve europiane të politikave dhe e të dhënave nga konteksti shqiptar çon në një përfundim të qartë: gatishmëria digjitale e mësueseve të arsimit parashkollor nuk është më një zgjedhje, por një domosdoshmëri e kohes.

Mangësitë ekzistuese: teknike, pedagogjike dhe qëndrimore, kërkojnë ndërhyrje sistematike dhe të koordinuara nga politikëbërësit, institucionet akademike dhe strukturat arsimore. Tre rekomandime kyçe rrjedhin nga kjo analizë:

Hartimi i një kuadri kombëtar të kompetencave digjitale për edukatoret, i bazuar në DigCompEdu dhe i adaptuar për kontekstin shqiptar. Ky kuadër duhet të shërbejë si bazë për formimin fillestar dhe të vazhdueshëm profesional.

Integrimi i moduleve të teknologjisë edukative dhe IA-së në programet universitare dhe pas-universitare të formimit të edukatoreve, me fokus jo vetëm tek aftësitë teknike, por edhe tek pedagogjia digjitale dhe etika e përdorimit të teknologjisë me fëmijë.

Teknologjia duhet të ndërthuret me procesin edukativ në mënyrë të qëllimshme dhe të përshtatshme për moshën e fëmijëve. Ajo nuk duhet të përdoret si qëllim në vetvete, por si mjet që ndihmon të nxënit përmes lojës, ndërveprimit dhe paraqitjes vizuale të koncepteve që për fëmijët mund të jenë abstrakte. Për këtë arsye, mësueset e arsimit parashkollor kanë nevojë për trajnim dhe mbështetje institucionale, në mënyrë që ta përdorin teknologjinë për të pasuruar përvojat mësimore të fëmijëve, jo për t'i zëvendësuar ato.

Punimi solli një këndvështrim të plotë mbi gatishmërinë digjitale të mësueseve të arsimit parashkollor, duke lidhur literaturën shkencore, përvojat europiane dhe realitetin shqiptar. Theksojmë se, përgatitja digjitale e mësueseve nuk duhet parë vetëm si aftësi teknike, por si pjesë e cilësisë së arsimit parashkollor. Në të ardhmen, është e rëndësishme që politikat dhe trajnimet në këtë fushë të mbështeten më shumë në të dhëna konkrete mbi nevojat reale të mësueseve dhe të kopshteve shqiptare.

Artificial Intelligence in Digital Onboarding: Real Security or the Illusion of Automation?

Msc. Rovena Kalliri

Independent Professional - AML/CFT, Anti-Fraud and Data Protection, Tirana, Albania.
kallirirovena@hotmail.com

Abstract

The use of artificial intelligence in digital onboarding, customer identification, and financial crime controls has increased significantly as part of the digital transformation of the financial sector. This technology is widely regarded as a tool for enhancing efficiency, accelerating processes, and improving risk analysis.

This study aims to critically assess whether automation through artificial intelligence produces real security or creates a false perception of security in practice. Based on a qualitative analytical approach, supported by financial sector practices and the regulatory framework on AML/CFT and personal data protection, it argues that the use of artificial intelligence, in the absence of strong governance and oversight mechanisms, does not necessarily reduce risk, but often shifts it into more complex and less visible forms.

The main risks are identified in the quality and integrity of data, inconsistencies across information sources, inaccuracy of results, lack of algorithmic transparency, and implications for individual privacy. The findings suggest that the effectiveness of digital onboarding does not depend on the level of automation itself, but rather on the balance between technology, institutional governance, and professional judgment.

In conclusion, the paper proposes a structured governance approach for digital onboarding, in which artificial intelligence is conceptualized as a decision-support tool rather than a substitute for decision-making, emphasizing the importance of transparency, accountability, and human oversight.

Keywords: *Artificial intelligence; digital onboarding; AML/CFT; AI governance; digital risk; data protection.*

1. Introduction

Digital onboarding has become one of the most visible expressions of digital transformation in financial services. Banks, payment institutions, electronic money institutions and fintech providers increasingly allow customers to open accounts, verify identity, complete customer due diligence and obtain access to financial services through remote channels. This shift offers operational efficiency, lower friction, wider reach and the possibility of stronger controls at the point of entry into the financial system. It also changes the risk profile of customer acceptance. The traditional face-to-face interaction between a customer and a trained employee is being replaced by a chain of digital tools, automated checks, biometric verification, optical character recognition, sanctions and PEP screening, risk scoring engines and workflow decisions.

This development has particular significance in AML/CFT, anti-fraud and data protection practice. Onboarding is not merely a commercial entry point; it is the moment at which an institution must establish who the customer is, whether the person is acting on his or her own behalf, whether the customer presents sanctions or financial crime concerns and whether the institution can lawfully process the personal data required for the relationship. FATF Recommendation 10 requires financial institutions to identify and verify customers, understand the purpose and intended nature of the relationship and conduct ongoing due diligence. In Albania, these obligations are reflected in Law No. 9917/2008 on the prevention of money

laundering and financing of terrorism, as amended, and in sectoral supervisory regulation for banks and financial institutions.

Artificial intelligence appears, at first sight, to offer a powerful answer to these obligations. It can read identity documents, compare faces, detect presentation attacks, identify anomalies, match names against sanctions and adverse media data, and support dynamic risk scoring. However, automation should not be equated with security. A system may be fast and consistent but still rely on incomplete data, weak model design, poorly calibrated thresholds or insufficient human review. Equally, a fully digital process may leave a complete electronic trail but still fail to explain why a customer was rejected, why an alert was cleared or why a false negative was generated.

The central research question of this paper is therefore: does AI-enabled digital onboarding produce real security, or can it create an illusion of security by transferring risk from visible manual processes into less visible automated systems? The paper argues that AI can improve onboarding only when it operates within a structured governance framework. Without such a framework, AI may obscure operational weaknesses, create over-reliance on vendor outputs and weaken accountability. The contribution of the paper is a practical governance model for regulated financial institutions that combines technology controls, institutional governance and professional judgment.

2. Literature and regulatory framework

2.1 Digital onboarding and AML/CFT obligations

Remote onboarding is a practical response to the digitisation and digitalisation of financial services. It converts identity collection, identity verification, customer screening and account-opening decisions into digital workflows. From an AML/CFT perspective, this workflow must remain equivalent in substance to a robust customer due diligence process. The EBA Guidelines on the use of Remote Customer Onboarding Solutions emphasise that credit and financial institutions should ensure safe and effective remote onboarding practices in line with AML/CFT law and the EU data protection framework (European Banking Authority, 2022). The FATF Guidance on Digital Identity similarly recognises that digital ID systems may support customer due diligence when their assurance level is understood and assessed under a risk-based approach (FATF, 2020).

Digital onboarding therefore does not remove the need for professional assessment. It changes the way evidence is obtained, validated, retained and reviewed. The institution must be able to demonstrate that the customer identity was verified through reliable and independent sources, that the process was secure against impersonation and fraud, and that exceptions were handled through documented escalation. The legal obligation remains with the regulated institution, not with the algorithm or the external vendor providing the technical solution.

2.2 AI governance in high-stakes financial decisions

AI governance literature has increasingly moved beyond the question of model performance toward the broader question of institutional accountability. NIST defines trustworthy AI through characteristics such as validity, reliability, safety, security, resilience, accountability, transparency, explainability, interpretability, privacy enhancement and fairness with harmful bias managed (NIST, 2023). ISO/IEC 42001 frames AI governance as a management system requiring policies, objectives, risk management, data governance, monitoring and continual improvement (ISO, 2023). These standards are relevant to digital onboarding because customer acceptance decisions affect access to financial services and may have legal, commercial and reputational consequences.

Academic literature also warns against the use of opaque models in high-stakes decisions. Rudin (2019) argues that interpretable models should be preferred to post-hoc explanations of black-box models where the consequences of error are serious. Raji et al. (2020) propose end-to-end internal algorithmic auditing as a mechanism for closing the AI accountability gap. Selbst et al. (2019) further show that fairness and accountability cannot be understood only as mathematical properties; they must be assessed in their social and institutional context. These perspectives support the view that AI-enabled onboarding should be governed as a socio-technical control environment rather than as a purely technical tool.

2.3 Data protection, biometric data and automated decision-making

Digital onboarding involves intensive processing of personal data. Identity documents, facial images, liveness checks, device data, geolocation signals, behavioural patterns and screening outputs may all be collected or generated during the onboarding journey. The GDPR establishes principles of lawfulness, fairness, transparency, purpose limitation, data minimisation, accuracy, storage limitation, integrity and confidentiality. Article 22 of the GDPR also restricts solely automated decisions that produce legal or similarly significant effects and requires safeguards where such decisions are permitted. Albania's Law No. 124/2024 on Personal Data Protection follows a GDPR-aligned approach and includes safeguards relating to automated decisions and manual intervention.

The privacy challenge is heightened where biometric data is used. Unlike passwords or tokens, biometric identifiers such as facial templates cannot easily be replaced if compromised. A privacy breach in biometric onboarding may therefore create long-term harm for the individual. In addition, biometric verification can produce different accuracy rates across populations, identity document formats, lighting conditions and device quality. For this reason, the governance of AI-enabled onboarding must include data minimisation, strict access control, retention limits, encryption, audit trails, vendor due diligence and a clear legal basis for each category of data processed.

2.4 Digital identity wallets, eIDAS 2.0 and continuous assurance

The European Digital Identity Framework introduced by Regulation (EU) 2024/1183 and the European Digital Identity Wallet may raise the level of assurance for remote identification by relying on regulated identity credentials and mutual recognition across the EU. EY's 2026 analysis of EU AML readiness also links digital onboarding with eIDAS-compliant identity verification and a more risk-based approach to customer due diligence. These developments are relevant to this paper because they show a regulatory movement away from fragmented evidence collection and toward trusted, verifiable identity sources.

However, trusted digital identity does not eliminate AML/CFT risk. A valid identity credential can confirm who a person is, but it does not by itself establish source of funds, intended account activity, sanctions exposure, mule risk or subsequent fraudulent behaviour. For this reason, digital identity wallets should be treated as an improvement in identity evidence, not as a substitute for risk assessment, screening, monitoring and professional judgment.

2.5 Liveness detection, deepfake detection and biometric assurance

A further distinction is important for professional accuracy: liveness detection and deepfake detection are related but not identical controls. Liveness detection seeks to verify that a biometric input comes from a live person who is present at the time of capture. Deepfake detection seeks to identify whether image, video or audio content has been synthetically generated or manipulated. Vendor and technical materials from OLOID, iProov, DuckDuckGoose

AI and Biometric Update indicate that modern identity-verification stacks increasingly need both forms of assurance, particularly where injection attacks or real-time synthetic media may bypass weaker camera-based checks.

The control implication is that a financial institution should not state simply that it uses biometrics. It should be able to explain what type of biometric control is used, whether it detects presentation attacks, whether it detects digital injection attacks, whether it has been independently tested and how failed or low-confidence results are routed to human review. This supports the paper's broader claim that the security value of AI does not arise from the existence of the tool, but from validated performance, governance and evidence.

2.6 Synthetic identity, deepfakes and the onboarding dilemma

Recent professional and industry literature shows that the key fraud challenge is no longer limited to forged documents or isolated impersonation attempts. AI tools can support the creation of synthetic identities, realistic facial or voice deepfakes, fabricated digital footprints and coordinated multi-step fraud journeys. Sumsub describes this as a shift from simple fraud toward more sophisticated attacks, reporting a 180% increase in sophisticated fraud compared with 2024. PwC similarly frames the 2026 fraud landscape around deepfakes and synthetic identities that blur the boundary between legitimate and fraudulent customers. Thomson Reuters Institute highlights a related onboarding dilemma: a customer may appear legitimate at account opening and only later use the account for fraud, scam activity or mule behaviour. This literature strengthens the argument that onboarding should not be treated as a single point-in-time gate, but as the beginning of an identity and financial crime assurance lifecycle.

For this paper, these industry reports are used as contextual evidence of emerging risk typologies rather than as statutory standards. Their value lies in showing how criminal behaviour is adapting to automated controls. If fraudsters can automate credible identities, account histories and behavioural signals, then the institution's governance model must also move beyond document capture and facial comparison toward layered identity assurance, early-life account monitoring and integrated fraud/AML escalation.

3. Methodology

The study is designed as a conceptual and practice-oriented qualitative analysis rather than an empirical or statistical assessment of a specific AI model, vendor or institutional dataset. It combines doctrinal analysis of relevant AML/CFT, data protection and AI governance sources with professional analysis of typical onboarding practices in regulated financial institutions. The study does not use confidential customer data, institution-specific records or proprietary vendor performance results. Instead, it analyses the control logic of digital onboarding as a regulated process and identifies the points at which automation may strengthen or weaken security.

The methodological approach is structured around four analytical layers. First, the paper examines the regulatory expectations applicable to customer identification, verification, remote onboarding, data protection and automated decision-making. Second, it analyses the operational design of AI-enabled onboarding workflows, including document extraction, biometric verification, screening and decision routing. Third, it identifies the main risk families that arise when AI outputs are treated as definitive rather than evidential. Fourth, it develops a governance framework that can be used by institutions to convert AI from an opaque decision-maker into an accountable decision-support tool.

The limitations of the paper should also be stated. The analysis is conceptual and practice-oriented rather than empirical in the statistical sense. It does not measure the performance of a

specific AI model or vendor. Its value lies in identifying governance requirements and control questions that are relevant across different institutions, technologies and jurisdictions.

The literature base is deliberately differentiated by source type. Regulatory and standard-setting sources, such as FATF, EBA, the GDPR, the EU AI Act, eIDAS 2.0, NIST and ISO, are used as primary normative references. Academic literature is used to support concepts such as explainability, fairness, automation bias and algorithmic accountability. Vendor and industry reports are used more cautiously as trend evidence on synthetic identity, deepfakes, liveness detection and fraud/AML convergence. This distinction avoids treating commercial material as binding authority while still allowing the paper to reflect the current threat environment.

4. AI-enabled digital onboarding in the financial sector

A typical AI-enabled onboarding journey begins when a potential customer submits personal data through a web or mobile application. The customer may upload or scan an identity document, take a selfie, complete a liveness check, provide address or tax information and answer questions on occupation, income, expected activity and purpose of the relationship. Optical character recognition extracts data from the identity document, facial recognition compares the document image with the selfie, liveness technology seeks to prevent spoofing and automated screening checks the customer against sanctions, PEP, adverse media and internal risk lists.

After these checks, the workflow generally produces one of several outcomes: automatic approval, approval with conditions, request for additional information, manual review, rejection or escalation to a compliance officer/MLRO. In more advanced environments, the system may also create an initial customer risk rating, apply enhanced due diligence triggers, set monitoring rules or send data to a core banking system. This creates the impression of a seamless and controlled process. Nevertheless, every step depends on assumptions: that the data entered by the customer is accurate, that the identity document is read correctly, that the biometric match is reliable, that the screening lists are complete and updated, that the matching thresholds are calibrated and that the final decision logic aligns with the institution's risk appetite.

The security value of onboarding automation therefore depends on the quality of the control chain. A failure in any component may contaminate later decisions. If a name is extracted incorrectly, the screening result may be wrong. If the country of residence is mapped incorrectly, the risk rating may be distorted. If a false negative is produced in sanctions screening, the institution may onboard a prohibited person. If a false positive is not reviewed properly, a legitimate customer may be rejected without an adequate explanation. AI does not remove these risks; it changes their form, speed and visibility.

5. Findings: risk is transformed rather than eliminated

5.1 Data quality and identity data integrity

The first risk family relates to data quality and integrity. AI systems operate on the data they receive and the data, used to train, calibrate and validate them. Poor-quality images, outdated identity documents, inconsistent transliteration, missing fields, customer input errors and weak source-data governance can all produce unreliable outputs. In onboarding, data quality is not an administrative detail; it is the foundation of identity assurance. A small error in name order, date of birth, nationality, place of birth or address may alter screening results and customer risk assessment.

This risk is particularly important in multilingual and cross-border environments. Names may be written with or without diacritics, in different alphabets, with different transliterations or with different order conventions. Automated matching systems may treat these variations as irrelevant or significant depending on threshold settings. The institution must understand and document how these thresholds operate. Otherwise, the outcome may appear objective while reflecting hidden assumptions embedded in the data and configuration.

5.2 Inconsistencies across information sources

The second risk family is inconsistency across information sources. A digital onboarding ecosystem may rely on customer-entered data, identity-document data, biometric verification data, sanctions-list data, adverse media data, device intelligence, public registers and internal system records. These sources are rarely perfectly aligned. One system may use the manually entered name, another may use the name extracted from the identity document and a third may use the name stored in the core banking customer file. If the institution does not define a golden source for identity data and a process for resolving mismatches, automation may amplify inconsistency instead of correcting it.

This creates a control paradox. A fully digital process may appear to have more controls than a manual process, but if the controls are applied to inconsistent data, the institution may obtain a false sense of security. A robust onboarding governance model must therefore define data ownership, source hierarchy, reconciliation rules and escalation triggers. The question is not only whether the customer was screened, but which version of the customer's identity was screened, when, against which lists and with what result.

5.3 Inaccuracy of automated results: false positives and false negatives

The third risk family is inaccuracy of automated outputs. In AML/CFT screening, false positives and false negatives have different but serious consequences. False positives increase operational workload, delay customer onboarding, harm customer experience and may create unfair exclusion. False negatives are more dangerous from a financial crime perspective because they allow real risk to pass undetected. In both cases, the institution must be able to explain how matching thresholds are calibrated, how alerts are triaged and how decisions are documented.

AI models may also be affected by model drift. A model that performs adequately at the time of deployment may become less reliable as customer behaviour, fraud typologies, document formats, sanctions lists or criminal techniques change. Consequently, onboarding systems require periodic validation, scenario testing, tuning and independent review. Continuous monitoring is not optional; it is part of the evidence that automation is under control.

5.4 Algorithmic opacity and explainability

The fourth risk family concerns algorithmic opacity. Many AI systems produce scores, matches or recommendations without giving a human reviewer a full and intelligible explanation of the reasoning process. In low-risk operational tasks this may be acceptable. In customer onboarding, however, the output can determine access to financial services or trigger enhanced due diligence, refusal or reporting considerations. A black-box decision may therefore create conflict with auditability, customer rights and supervisory expectations.

Explainability should not be treated as a cosmetic explanation added after the decision. It should be built into the governance design. Institutions should know which data points influence the outcome, what confidence levels mean, which thresholds are applied, how exceptions are handled and when a human reviewer may override the result. Where a model is not sufficiently

explainable for a high-risk decision, the institution should consider limiting its role to preliminary triage rather than final decision-making.

5.5 Privacy and proportionality

The fifth risk family relates to privacy and proportionality. AI-enabled onboarding may encourage institutions to collect more data than is strictly necessary because additional data appears to improve detection. This may conflict with data minimisation and purpose limitation. In practice, the institution must ask whether each data point is necessary for the onboarding purpose, how long it will be retained, who can access it, whether it is transferred to third parties and whether it may be reused for other purposes.

Biometric data requires particular caution. The value of biometric verification lies in its ability to strengthen identity assurance, but the same feature makes the data sensitive and difficult to replace. Strong controls are therefore required: encryption, segregation, access limitation, vendor restrictions, deletion routines, breach response procedures and transparent information to customers. Privacy by design must be integrated into the onboarding architecture rather than added as a notice at the end of the process.

5.6 Operational over-reliance and accountability gap

A further cross-cutting risk is operational over-reliance. When a system is perceived as intelligent, users may stop questioning its outputs. This may lead to automation bias, where human reviewers accept an AI recommendation even when contextual evidence suggests that it should be challenged. It may also lead to deskilling, as staff become operators of workflows rather than professionals exercising judgment. In financial crime control, this is dangerous because suspicion often depends on context, pattern recognition and the ability to connect weak signals across systems.

Accountability must therefore be designed explicitly. The institution should define who owns the AI onboarding policy, who validates the model, who approves thresholds, who reviews exceptions, who monitors vendor performance, who responds to customer complaints and who reports material issues to management or regulators. Without these roles, responsibility may become dispersed across IT, compliance, operations, vendors and management, creating an accountability gap.

5.7 Synthetic identity, deepfake and early-life account risk

The seventh risk area is synthetic identity and deepfake-enabled onboarding risk. Synthetic identity fraud combines real, stolen or fabricated identity attributes to create a person who appears plausible to an institution. Generative AI can strengthen this deception by producing convincing images, videos, voice samples, documents and online traces. The practical risk is not only that a fake customer passes onboarding, but also that the account initially behaves normally and becomes harmful only after a short period of account seasoning.

This creates a gap between onboarding security and lifecycle security. A digital process may correctly verify a document and face at a single moment, but still fail to detect that the identity is synthetic, that the device is linked to a fraud ring, that the customer's early transactions are inconsistent with declared activity or that the account is being prepared for mule use. Institutions should therefore connect onboarding results with early-life monitoring, fraud intelligence, device intelligence and AML transaction monitoring. This is especially important during the first days and weeks after account opening, when traditional customer behaviour history is limited.

Table 1. Main risks of AI-enabled digital onboarding and governance implications

Risk family	Operational manifestation	Potential consequence	Governance response
Data quality and integrity	Incorrect OCR extraction, poor image quality, missing or inconsistent identity fields	Wrong screening result, distorted risk rating, unreliable customer file	Golden-source rules, data validation, exception workflow and periodic data-quality testing
Source inconsistency	Different systems screen or store different versions of customer identity	False assurance that the customer has been fully screened	Source hierarchy, reconciliation controls and mandatory re-screening after corrected identity data
False positives and false negatives	Excessive alerts or undetected true risk due to thresholds or weak calibration	Operational overload, unfair exclusion or onboarding of prohibited/high-risk persons	Scenario testing, threshold governance, model validation and quality assurance
Algorithmic opacity	Scores or decisions cannot be explained to reviewers, customers or regulators	Weak auditability, poor contestability and inability to evidence compliance	Explainability standards, model documentation, human review and override rights
Privacy and biometric risk	Collection and retention of sensitive biometric data without strict proportionality controls	Long-term harm to individuals, breach exposure and regulatory sanction	Privacy by design, data minimisation, encryption, access control and retention limits
Accountability gap	Responsibility dispersed between business, IT, compliance and vendors	No clear owner for errors, incidents or remediation	Formal AI governance policy, RACI matrix, senior-management reporting and vendor oversight
Synthetic identity and deepfake risk	AI-generated or manipulated identity evidence, plausible digital footprints, account seasoning and early-life fraud behaviour	Customer appears legitimate at onboarding but later uses the account for fraud, mule activity, sanctions evasion or other financial crime	Layered biometric assurance, deepfake/injection controls, device and behavioural analytics, early-life monitoring and fraud/AML escalation

6. Discussion: real security versus the illusion of automation

The distinction between real security and the illusion of automation lies in the relationship between efficiency and control. Real security exists when the institution can demonstrate that the onboarding decision is based on accurate data, appropriate risk logic, reliable screening, documented review and accountable approval. The illusion of automation exists when the institution assumes that a digital workflow is secure simply because it is automated, fast and externally provided by a technology vendor.

Automation can create three forms of illusion. The first is the illusion of completeness: because the system performs multiple checks, users assume that all material risks have been addressed. The second is the illusion of objectivity: because the output is generated by a model, users assume that it is neutral and free from human bias. The third is the illusion of accountability: because the process is logged, users assume that responsibility is clear. In reality, logs record events; they do not automatically explain whether the event was correct, lawful or risk-sensitive.

A strong governance framework converts automation from a source of illusion into a source of evidence. It requires the institution to treat AI outputs as risk indicators rather than final truths. It also requires a clear escalation logic. Low-risk, high-confidence cases may be processed automatically where legally permissible and properly controlled. Medium-risk or uncertain cases should be routed to trained reviewers. High-risk cases involving sanctions, suspected fraud, serious adverse media, biometric mismatch or identity inconsistency should require documented human decision-making and, where relevant, MLRO escalation.

In this sense, the most persuasive version of the paper is not anti-technology. It is anti-complacency. The practical message is that institutions should use AI to increase evidence, speed and consistency, but should reject the assumption that a green system status equals a safe customer. The more sophisticated the fraud environment becomes, the more important it is to connect onboarding with post-onboarding intelligence, model governance and accountable review.

The human role must therefore be meaningful rather than symbolic. A human-in-the-loop arrangement is weak if the reviewer has no time, training, authority or access to underlying evidence. Meaningful human oversight requires the ability to understand the basis of the recommendation, challenge the result, request additional information, override the system and document the rationale. This is where professional judgment becomes a governance control.

7. Proposed governance framework for AI-enabled onboarding

This paper proposes a three-pillar governance framework. The first pillar is technology and model control. It covers data quality, model design, configuration, testing, validation, cybersecurity, logging and vendor performance. The second pillar is institutional governance. It covers policies, committees, risk appetite, role allocation, reporting, independent assurance and regulatory alignment. The third pillar is professional judgment. It covers human review, escalation, training, contestability and customer-rights safeguards. The framework is designed to ensure that AI supports decision-making without replacing accountability.

Table 2. Three-pillar governance framework for AI-enabled digital onboarding

Pillar	Core objective	Minimum controls	Evidence expected
Technology and model control	Ensure the AI system is technically reliable, secure and appropriately calibrated	Data-quality checks; model documentation; validation; threshold approval; logging; cyber-security controls; change management	Validation reports; test cases; configuration approvals; incident logs; change records; vendor SLAs
Institutional governance	Ensure the institution owns the risk and decision framework	AI onboarding policy; risk appetite alignment; RACI matrix; committee oversight; independent assurance; regulatory reporting route	Policies; committee minutes; RACI; risk assessments; audit reports; management information
Professional judgment	Ensure human reviewers can challenge, override and explain AI outputs	Manual review gates; escalation criteria; training; customer contestability; documentation of overrides and rationale	Case notes; review decisions; training records; complaint logs; quality assurance results

Conceptual model of AI-enabled onboarding governance. AI is positioned as a decision-support layer between technology controls and institutional governance, while professional judgment acts as the final safeguard for high-risk, uncertain or legally sensitive decisions.

7.1 Technology and model control

Technology control begins with a clear understanding of the AI system's purpose and boundaries. The institution should distinguish between AI used for data extraction, AI used for biometric verification, AI used for screening support and AI used for risk scoring. Each function has a different risk profile and should be validated separately. A model that performs well for document extraction may not be sufficient for final customer acceptance. A screening tool may detect possible matches but should not automatically determine whether a case represents a true match without appropriate review.

Model control should include pre-deployment testing, periodic validation, drift monitoring, independent review and documented change management. Calibration decisions, such as fuzziness thresholds in name screening or confidence thresholds in biometric matching, should be approved through governance rather than left to informal operational preference. The institution should also define fallback procedures for system downtime, unclear results and model failure.

7.2 Institutional governance

Institutional governance ensures that AI-enabled onboarding is aligned with the institution's risk appetite and legal obligations. A formal AI onboarding policy should define what may be automated, what must remain subject to human review, which outcomes trigger enhanced due diligence and which cases require escalation. The policy should also define the responsibilities of business owners, compliance, AML, data protection, IT, information security, internal audit and third-party vendors.

Governance should also include management information. Senior management should receive periodic reports on onboarding volumes, automated approvals, manual-review rates, false

positives, confirmed matches, biometric failures, customer complaints, system incidents, model changes and data-quality issues. These indicators allow the institution to detect whether automation is actually improving security or merely moving risk into exception queues.

7.3 Professional judgment and meaningful human oversight

Professional judgment is the safeguard that connects regulatory purpose with operational reality. A compliance reviewer should not be reduced to confirming that a system output exists. The reviewer should be able to assess context, compare data sources, evaluate inconsistencies, request further information, reject weak evidence and escalate suspicion. The human role is especially important where the case involves sanctions, PEP status, adverse media, fraud indicators, unusual identity patterns, vulnerable customers, data mismatch or automated refusal.

Meaningful human oversight also protects customer rights. Where a customer is rejected or materially affected by an automated decision, the institution should provide a channel for review by a competent person, without disclosing information that would create tipping-off or weaken financial crime controls. The challenge is to balance transparency with AML/CFT confidentiality. This balance requires clear scripts, documented procedures and staff training.

8. Recommendations for regulated financial institutions

Based on the analysis above, the following recommendations are proposed for banks, payment institutions, electronic money institutions and fintech providers that deploy AI in digital onboarding.

First, institutions should adopt a formal AI onboarding policy. The policy should define the scope of AI use, decision limits, ownership, escalation criteria, data-protection safeguards and customer-rights procedures. It should clearly state that AI supports decision-making but does not replace institutional accountability.

Second, institutions should perform an AI and data protection impact assessment before deployment and after material changes. This assessment should consider AML/CFT risk, fraud risk, data protection risk, cyber risk, operational risk, outsourcing risk and customer fairness. It should identify high-risk processing, biometric data use, automated decision points and mitigation measures.

Third, institutions should implement data-governance controls. These should include identity-data source hierarchy, validation of OCR outputs, reconciliation of customer-entered and document-extracted data, re-screening after material data corrections and periodic data-quality reporting.

Fourth, institutions should validate models and configurations. Validation should test accuracy, bias, false positives, false negatives, threshold sensitivity, list coverage, performance drift and resilience. The validation should be documented and repeated periodically, with results reported to the relevant governance body.

Fifth, institutions should maintain audit trails that are useful, not merely voluminous. A good audit trail should show what data was used, which checks were performed, which version of the model or list was applied, who reviewed the case, what decision was taken and why. Auditability requires both system logs and human rationale.

Sixth, institutions should design meaningful human-review gates. Automated approval may be appropriate only for clear low-risk cases within defined criteria. Cases involving material uncertainty, sanctions or PEP indicators, adverse media, fraud signs, biometric mismatch,

inconsistent identity data or high-risk geography should be routed to trained reviewers and, where necessary, escalated to the MLRO or equivalent responsible function.

Seventh, institutions should strengthen third-party governance. Contracts with onboarding and screening vendors should include performance expectations, data protection clauses, audit rights, incident notification, change-notification duties, information-security requirements and exit arrangements. Vendor outputs should be independently assessed by the institution.

Eighth, institutions should invest in staff training. Operational teams should understand not only how to use the system, but also its limitations, risk indicators, escalation rules and data-protection requirements. AI literacy should be part of compliance and operational training, particularly for staff who clear alerts or handle customer objections.

Ninth, institutions should move from one-time onboarding to early-life and continuous identity assurance. The first 30 to 90 days after account opening should be treated as a sensitive monitoring window, especially for fully digital customers with no prior history. Monitoring should include device changes, rapid account activation after dormancy, unexpected incoming/outgoing flows, mule typologies, mismatch between declared purpose and actual use, and repeated failed authentication or biometric attempts.

Tenth, institutions should define an explicit anti-deepfake and anti-synthetic identity control standard. This standard should distinguish document authenticity, face matching, liveness detection, injection attack detection, deepfake detection, device intelligence and behavioural analytics. Vendor claims should be supported by independent testing evidence, incident reporting and clear performance metrics rather than accepted as marketing assurances.

Eleventh, institutions should converge AML, fraud, cybersecurity and data protection governance for digital onboarding. AI-enabled identity fraud often crosses functional boundaries: it may start as a cyber or device signal, pass through onboarding as an identity signal, emerge as fraud behaviour and later become an AML concern. A combined financial-crime governance forum can reduce fragmentation and ensure that alerts, typologies and remediation actions are shared across teams.

Table 3. Human oversight gates in AI-enabled digital onboarding

Decision point	AI role	Human role	Documentation required
Identity extraction	Read and structure identity-document data	Verify mismatches, unreadable fields and inconsistencies	Original document image, extracted fields, correction rationale
Biometric verification	Compare document image, selfie and liveness signals	Review failures, low-confidence matches and spoofing indicators	Score, reason code, reviewer decision and evidence retained
Screening and risk scoring	Generate sanctions/PEP/adverse media hits and preliminary risk score	Assess true/false match, contextual risk and escalation need	Search parameters, list version, match analysis and final rationale
Automated rejection or enhanced due diligence trigger	Flag case according to rules or model threshold	Confirm proportionality and legal basis; provide review route where	Decision basis, customer communication and escalation record

Decision point	AI role	Human role	Documentation required
		appropriate	
Ongoing changes after onboarding	Detect changes in identity data, list updates or risk profile	Review material changes and re-screen where needed	Change log, re-screening result and updated customer risk decision

Table 4. How the additional 2025-2026 reference material strengthens the paper

Reference trend	Professional implication	How it strengthens the paper
Deepfakes and synthetic identities	Identity evidence can be fabricated or manipulated at scale	Adds a current threat dimension to the risk analysis beyond traditional OCR and face matching
Onboarding dilemma and first-party fraud	A customer may look normal at account opening and become risky after short account seasoning	Supports the recommendation for early-life monitoring and continuous assurance
Fraud/AML/cyber convergence	AI-enabled financial crime crosses organizational boundaries	Justifies integrated financial-crime governance rather than isolated AML review
Liveness vs deepfake detection	Presence detection and content manipulation detection are different controls	Improves technical precision and avoids overclaiming that biometrics alone solve the risk
EUDI wallet and eIDAS 2.0	Trusted digital credentials can improve identity assurance	Shows the future direction of compliant onboarding while maintaining the need for AML/CFT risk assessment
Model governance and explainability	Regulators expect evidence of performance, testing, controls and accountable ownership	Strengthens the three-pillar governance model with practical audit evidence requirements

9. Conclusions

AI-enabled digital onboarding can strengthen financial crime controls, but only when it is governed as part of a broader institutional control framework. The core finding of this paper is that automation does not automatically produce security. It may improve speed, consistency and scalability, but it can also hide weaknesses in data quality, screening logic, model transparency, privacy controls and accountability. The effect of AI is therefore not to eliminate risk, but to transform it. Whether this transformation produces real security or an illusion of control depends on governance.

The paper has identified data quality, source inconsistency, false positives and false negatives, algorithmic opacity, privacy risk and accountability gaps as the main risk families in AI-enabled onboarding. These risks are interconnected. Poor data quality can produce wrong screening results; opaque models can prevent meaningful review; weak escalation can convert an

automated output into an unchallenged decision; excessive data collection can undermine the legitimacy of the process. The appropriate response is not to reject AI, but to limit its role to decision support where human accountability remains clear.

The proposed framework places AI within three pillars: technology and model control, institutional governance and professional judgment. This framework supports a practical conclusion for regulated institutions: AI should propose, classify, prioritise and evidence; humans and institutions should govern, assess, decide and remain accountable. Real security is achieved where digital efficiency is combined with transparency, explainability, auditability, proportionality and meaningful human oversight. In that model, AI becomes a tool for stronger compliance rather than a substitute for it.

Abstrakt

Ky punim analizon në mënyrë të detajuar evolucionin e masës mesatare të pensioneve në Shqipëri sipas llojit të pensionit (pleqëri, invaliditet dhe pension familjar) dhe sipas ndarjes territoriale qytet–fshat gjatë periudhës 2014–2024. Studimi vendoset në kontekstin e transformimeve demografike, ekonomike dhe institucionale që kanë karakterizuar sistemin shqiptar të sigurimeve shoqërore gjatë dekadës së fundit, veçanërisht në kushtet e plakjes progresive të popullsisë dhe ndryshimeve në strukturën e tregut të punës. Duke u mbështetur në të dhëna statistikore zyrtare të publikuara nga institucionet kombëtare të statistikave dhe sigurimeve shoqërore, ndërtohet një bazë e strukturuar e të dhënave panel në nivel viti, e cila mundëson analizën empirike të dinamikave kohore të pensioneve dhe identifikimin e diferencave strukturore ndërmjet zonave urbane dhe rurale.

Analiza deskriptive dhe ekonometrike evidenton trendet afatgjata të rritjes së pensioneve për kategoritë kryesore të përfitimeve sociale, duke nxjerrë në pah ndikimin e reformave të indeksimit, ndryshimeve në nivelin e pagave dhe presioneve inflacioniste mbi sistemin e pensioneve. Studimi thekson se pensionet e pleqërisë dhe invaliditetit paraqesin rritje të qëndrueshme si në zonat urbane ashtu edhe në ato rurale, duke reflektuar stabilitet relativ të skemës së sigurimeve shoqërore dhe përpjekjet institucionale për ruajtjen e fuqisë blerëse të përfituesve. Në kontrast, pensioni familjar në zonat rurale paraqet një trajektore rënëse në periudhë, duke sugjeruar praninë e faktorëve strukturorë si ndryshimet demografike, migracioni, transformimet familjare dhe ndryshimet në kriteret e përfitimit.

Për të analizuar dhe parashikuar evolucionin e ardhshëm të pensioneve, punimi aplikon dy qasje të avancuara të analizës së serive kohore, konkretisht modelet e zbutjes eksponenciale (Exponential Smoothing ETS në versionin Holt) dhe modelet autoregresive të integruara me mesatare lëvizëse (ARIMA). Për të garantuar besueshmërinë dhe robustësinë e rezultateve parashikuese, studimi implementon një procedurë validimi retrospektiv (backtesting) me horizont trevjeçar për periudhën 2022–2024, duke krahasuar performancën e modeleve përmes treguesve standardë të gabimit parashikues. Për më tepër, përdoret një qasje e kombinuar (ensemble) që integron rezultatet e të dy modeleve për të reduktuar variancën e parashikimeve dhe për të rritur stabilitetin e rezultateve.

Rezultatet empirike tregojnë se, në kushtet e vazhdimit të politikave aktuale të indeksimit dhe zhvillimit ekonomik, masa mesatare e pensioneve të pleqërisë pritet të vazhdojë trendin rritës edhe gjatë periudhës 2025–2030. Parashikimet sugjerojnë gjithashtu ruajtjen e diferencave strukturore ndërmjet zonave urbane dhe rurale, duke reflektuar ndryshimet në historikun e kontributeve, strukturën e tregut të punës dhe nivelin e zhvillimit ekonomik rajonal. Në të njëjtën kohë, studimi evidenton se presionet demografike dhe rritja e raportit midis përfituesve dhe kontribuuesve mund të krijojnë sfida afatgjata për qëndrueshmërinë fiskale të sistemit të pensioneve.

Në aspektin praktik dhe politik, gjetjet e studimit ofrojnë evidencë të rëndësishme për hartimin e politikave publike në fushën e sigurimeve shoqërore dhe planifikimit buxhetor. Analiza sugjeron nevojën për zhvillimin e mekanizmave më fleksibël të indeksimit të pensioneve, reduktimin e pabarazive territoriale dhe integrimin e parashikimeve ekonometrike në proceset strategjike të menaxhimit të sistemit të pensioneve. Gjithashtu, punimi kontribuon në literaturën shkencore duke ofruar një qasje metodologjike të integruar për analizën dhe parashikimin e përfitimeve sociale në ekonomitë në tranzicion, duke kombinuar teknikat klasike të serive kohore me analiza empirike të bazuara në të dhëna zyrtare.

Fjalëkyçe: *Pensione, Sigurime Shoqërore, Ekonometrikë, Seritë Kohore, ETS, ARIMA, Parashikim Ekonomik, Shqipëri.*

1. HYRJE

Monitorimi dhe parashikimi i masës së pensioneve përbën një komponent thelbësor në analizën e qëndrueshmërisë fiskale dhe në hartimin e politikave sociale në ekonomitë moderne. Sistemet e sigurimeve shoqërore janë ndër mekanizmat kryesorë të mbrojtjes sociale, pasi ato sigurojnë të ardhura për individët në periudha të jetës kur aftësia për të gjeneruar të ardhura nga puna reduktohet ose zhduket. Në këtë kuadër, analiza e evolucionit të pensioneve nuk lidhet vetëm me dimensionin financiar të skemës së sigurimeve shoqërore, por edhe me vlerësimin e mirëqenies sociale, nivelin e barazisë ekonomike dhe stabilitetin makroekonomik të vendit.

Në kontekstin e Shqipërisë, rëndësia e studimit të dinamikave të pensioneve rritet për shkak të disa faktorëve strukturorë që karakterizojnë ekonominë dhe shoqërinë shqiptare. Së pari, procesi i plakjes demografike ka filluar të shfaqë ndikim të dukshëm në strukturën e popullsisë, duke rritur gradualisht raportin midis përfituesve dhe kontribuuesve në sistemin e sigurimeve shoqërore. Ky fenomen krijon presione të drejtpërdrejta mbi qëndrueshmërinë financiare të skemës së pensioneve dhe kërkon analiza të vazhdueshme për të vlerësuar balancën midis të ardhurave nga kontributet dhe shpenzimeve për përfitime sociale. Së dyti, transformimet në tregun e punës, përfshirë informalitetin, migracionin dhe ndryshimet në strukturën sektoriale të ekonomisë, ndikojnë në mënyrë të drejtpërdrejtë në nivelin e kontributeve dhe në historikun e përfitimeve pensionale.

Një dimension tjetër i rëndësishëm që karakterizon sistemin shqiptar të pensioneve lidhet me diferencat territoriale midis zonave urbane dhe rurale. Këto diferenca pasqyrojnë jo vetëm ndryshimet në nivelin e pagave dhe strukturën e punësimit, por edhe pabarazitë historike në zhvillimin ekonomik rajonal dhe në aksesin ndaj tregut formal të punës. Pensionet urbane priren të jenë më të larta për shkak të nivelit më të madh të pagave dhe kontributeve, ndërsa pensionet rurale shpesh reflektojnë periudha më të gjata informaliteti dhe nivele më të ulëta të kontributeve. Studimi i këtyre diferencave është i rëndësishëm për të kuptuar dimensionin social të politikave pensionale dhe për të identifikuar mekanizmat që mund të reduktojnë pabarazitë territoriale.

Në këtë kontekst, përdorimi i metodave ekonometrike për analizën dhe parashikimin e pensioneve merr rëndësi të veçantë. Modelet e serive kohore, si Exponential Smoothing (ETS) dhe ARIMA, ofrojnë mjete analitike të përshtatshme për kapjen e trendeve afatgjata dhe luhatjeve ciklike të treguesve financiarë dhe socialë. Këto modele janë veçanërisht të dobishme në kushtet e disponueshmërisë së serive kohore të kufizuara, pasi ato mund të gjenerojnë parashikime të qëndrueshme duke u bazuar në informacionin historik të të dhënave. Për më tepër, përdorimi i teknikave të validimit retrospektiv (backtesting) rrit besueshmërinë e rezultateve dhe mundëson vlerësimin objektiv të performancës së modeleve parashikuese.

Ky artikull synon të kontribuojë në literaturën empirike mbi analizën e pensioneve në Shqipëri duke integruar analizën statistikore dhe modelimin ekonometrik në një kornizë të unifikuar kërkimore. Konkretisht, studimi ka tre objektiva kryesore. Së pari, ai synon të përshkruajë dhe

analizojë trendet historike të masës mesatare të pensioneve për tre kategori përfitimesh – pension pleqërie, pension invaliditeti dhe pension familjar – gjatë periudhës 2014–2024, duke identifikuar ndryshimet strukturore dhe territoriale. Së dyti, studimi synon të vlerësojë performancën parashikuese të modeleve ETS dhe ARIMA përmes një procedure validimi retrospektiv, duke krahasuar saktësinë dhe stabilitetin e tyre në parashikimin e të dhënave reale. Së treti, artikulli synon të prodhojë parashikime për periudhën 2025–2030, të cilat mund të përdoren si bazë analitike për ndërtimin e skenarëve të politikave sociale dhe fiskale në Shqipëri.

Nëpërmjet kësaj qasjeje, studimi synon të ofrojë një analizë të integruar të evolucionit të pensioneve dhe të kontribuojë në zhvillimin e metodologjive empirike për vlerësimin e sistemeve të mbrojtjes sociale në ekonomitë në tranzicion. Rezultatet e këtij punimi pritet të kenë implikime të rëndësishme për politikëbërjen, veçanërisht në drejtim të planifikimit buxhetor afatgjatë, reformave të indeksimit të pensioneve dhe reduktimit të pabarazive sociale dhe territoriale.

2. TË DHËNAT DHE NDËRTIMI I DATASET-IT

Të dhënat e përdorura në këtë studim merren nga tabela vjetore e masës mesatare të pensionit sipas llojit të pensionit dhe zonës (qytet/fshat) për periudhën 2014–2024, të publikuara nga institucionet zyrtare përgjegjëse për statistikën dhe administrimin e sigurimeve shoqërore në Shqipëri. Kjo tabelë përbën burimin primar të informacionit empirik dhe përfaqëson një seri kohore vjetore të strukturuar sipas tre kategorive kryesore të përfitimeve pensionale: pension pleqërie, pension invaliditeti dhe pension familjar. Për secilin lloj pensioni, vlerat raportohen veçmas për zonat urbane dhe rurale, duke mundësuar analizën e diferencave territoriale dhe identifikimin e pabarazive strukturore.

- Variablat kryesore të ndërtuara për analizë janë: **Lloji i pensionit**, i koduar si variabël kategorike me tre nivele (pleqëri, invaliditet, familjar);
- **Zona**, gjithashtu variabël kategorike binare (qytet = 1, fshat = 0, për qëllime ekonometrike);
- **Viti**, variabël kohore diskrete që mbulon intervalin 2014–2024;
- **Vlera**, e cila përfaqëson masën mesatare vjetore të pensionit në lekë dhe përbën variablën e varur kryesore në analizat ekonometrike.

Tabela origjinale e publikuar nga burimi zyrtar është në format “wide”, ku vitet paraqiten në kolona dhe kombinimet e llojit të pensionit me zonën paraqiten në rreshta. Megjithatë, për qëllime të analizës statistikore, modelimit të serive kohore dhe vizualizimit grafik, kjo strukturë nuk është optimale. Për këtë arsye, tabela u transformua në format “long” (ose “tidy data”), ku çdo rresht përfaqëson një vëzhgim unik për një kombinim specifik të (Lloj pensioni, Zonë, Vit). Kjo qasje është në përputhje me praktikat standarde të analizës së të dhënave panel dhe të modelimit ekonometrik, pasi lejon aplikimin fleksibël të metodave të regresionit, filtrimit kohor dhe analizës krahasuese ndër-grupe.

Transformimi wide → long u realizua përmes procedurave të ristrukturimit të të dhënave (reshaping), duke mapuar kolonat e viteve në një variabël të vetme kohore dhe duke ruajtur identifikuesit kategorikë për llojin e pensionit dhe zonën. Kjo strukturë e re mundëson:

- aplikimin e metodave të serive kohore për secilin grup veçmas;
- krahasimin e trajektoreve kohore ndërmjet qytetit dhe fshatit;
- llogaritjen e treguesve sintetikë si norma mesatare e rritjes (CAGR);

- integrimin e të dhënave në modele panel nëse në të ardhmen shtohen variabla shpjeguese.

Formalisht, dataset-i përfundimtar mund të përkufizohet si një panel i balancuar me dimension N=6N = 6N=6 njësi (3 lloje pensioni × 2 zona) dhe T=11T = 11T=11 periudha kohore, duke rezultuar në 66 vëzhgime totale. Kjo strukturë lejon analizë krahasimore ndër-sektoriale dhe ndër-territoriale brenda të njëjtit kuadër kohor.

Tabela 1. Shembull i strukturës së dataset-it (formati long).

Pensioni	Zona	Viti	Vlera
Pension pleqërie	Qytet	2014	14518.0
Pension pleqërie	Qytet	2015	14585.0
Pension pleqërie	Qytet	2016	14873.0
Pension pleqërie	Qytet	2017	15527.0
Pension pleqërie	Qytet	2018	15875.0
Pension pleqërie	Qytet	2019	16254.0
Pension pleqërie	Qytet	2020	15732.0
Pension pleqërie	Qytet	2021	17258.0
Pension pleqërie	Qytet	2022	17350.0
Pension pleqërie	Qytet	2023	18341.0
Pension pleqërie	Qytet	2024	19609.0
Pension pleqërie	Fshat	2014	7825.0

Struktura "long" rrit ndjeshëm fleksibilitetin analitik dhe përputhet me standardet bashkëkohore të analizës së të dhënave në ekonometrikë dhe shkencat sociale. Për më tepër, kjo formë e organizimit të të dhënave lehtëson riprodhueshmërinë e analizës, pasi çdo hap transformimi mund të dokumentohet dhe të replikohen rezultatet nga studiues të tjerë.

Në përmbledhje, përpunimi dhe strukturimi i të dhënave përbën një hap thelbësor metodologjik që garanton koherencë statistikore, transparencë analitike dhe integrim të lehtë në modele parashikuese si ETS dhe ARIMA, të cilat kërkojnë seri kohore të strukturuara në mënyrë konsistente.

3. STATISTIKAT PËRSHKRUESE DHE TRENDET

Rritja afatgjatë e masës mesatare të pensioneve vlerësohet përmes treguesit **Compound Annual Growth Rate (CAGR)**, i cili përfaqëson normën mesatare vjetore të rritjes së një variabli financiar ose ekonomik gjatë një periudhe të caktuar kohore, duke supozuar rritje të vazhdueshme dhe të përbërë. Ky tregues përdoret gjerësisht në analizat ekonomike dhe financiare për të sintetizuar ndryshimet afatgjata dhe për të krahasuar dinamika rritjeje ndërmjet grupeve të ndryshme analitike.

Në mënyrë formale, CAGR për masën mesatare të pensioneve për periudhën 2014–2024 përkufizohet si:

$$CAGR = \left(\frac{V_{2024}}{V_{2014}}\right)^{\frac{1}{T}} - 1$$

ku:

- V_{2024} - paraqet vlerën mesatare të pensionit në vitin përfundimtar 2024
- V_{2014} - paraqet vlerën mesatare të pensionit në vitin fillestar 2014
- T- paraqet numrin e viteve ndërmjet dy periudhave kohore
- Në këtë studim, T=10 vite.

Ky tregues sintetizon në një vlerë të vetme ritmin mesatar të rritjes vjetore, duke marrë në konsideratë efektin e rritjes së përbërë (compound growth). Ndryshe nga ndryshimi linear ose mesatarja aritmetike e normave vjetore të rritjes, CAGR reflekton më saktë trajektoren reale të evoluimit të pensioneve në periudhë afatgjatë. Për këtë arsye, ai konsiderohet një indikator më i qëndrueshëm dhe më i përshtatshëm për analiza krahasuese ndër-zonale dhe ndërmjet kategorive të ndryshme të pensioneve.

Përdorimi i CAGR në këtë studim mundëson identifikimin e diferencave strukturore në ritmet e rritjes së pensioneve ndërmjet zonave urbane dhe rurale, si dhe ndërmjet llojeve të ndryshme të përfitimeve sociale. Në veçanti, ky tregues ndihmon në evidentimin e efekteve të politikave të indeksimit, ndryshimeve në nivelin e pagave dhe presioneve inflacioniste mbi evolucionin e pensioneve. Për më tepër, analiza e CAGR krijon një bazë krahasuese për interpretimin e rezultateve të modeleve parashikuese, pasi normat historike të rritjes mund të përdoren si referencë për vlerësimin e qëndrueshmërisë së parashikimeve ekonometrike.

Tabela 2. Rritja afatgjatë (CAGR) 2014–2024 sipas llojit dhe zonës.

Pensioni	Zona	2014	2024	CAGR (%)
Pension pleqërie	Qytet	14518.00	19609.00	3.05
Pension pleqërie	Fshat	7825.00	11878.00	4.26
Pension invaliditeti	Qytet	12593.00	19039.00	4.22
Pension invaliditeti	Fshat	6113.00	8966.00	3.90
Pension familjare	Qytet	6765.00	9160.00	3.08
Pension familjare	Fshat	3252.00	1771.00	-5.90

Tabela paraqet normën mesatare vjetore të rritjes për secilin kombinim të llojit të pensionit dhe zonës territoriale, duke mundësuar analizën krahasimore të dinamikave të rritjes. Interpretimi i vlerave të CAGR lejon identifikimin e kategorive të pensioneve që kanë përjetuar rritje më të shpejtë dhe atyre që shfaqin stagnim ose rënie relative, duke ofruar evidencë të rëndësishme për analizën e politikave sociale dhe fiskale.

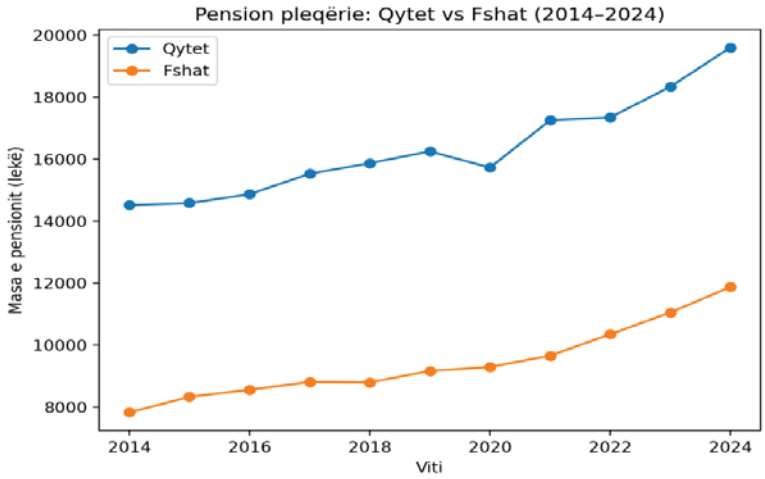

Figura 1. Pension pleqërie: Qytet vs Fshat (2014–2024)

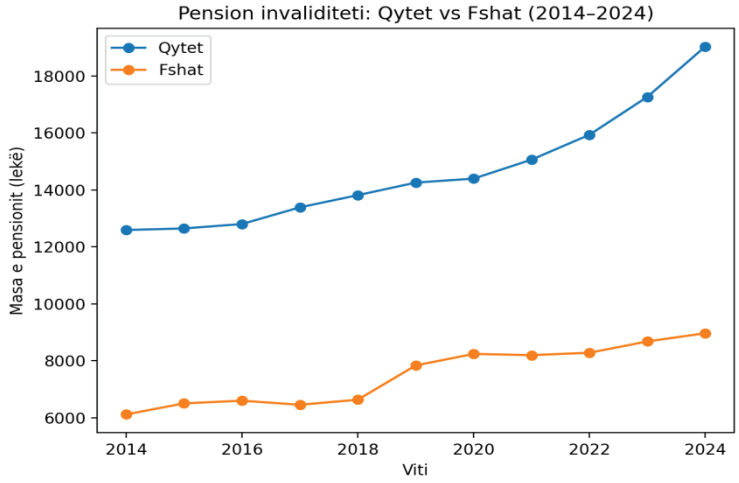

Figura 2. Pension invaliditeti: Qytet vs Fshat (2014–2024).

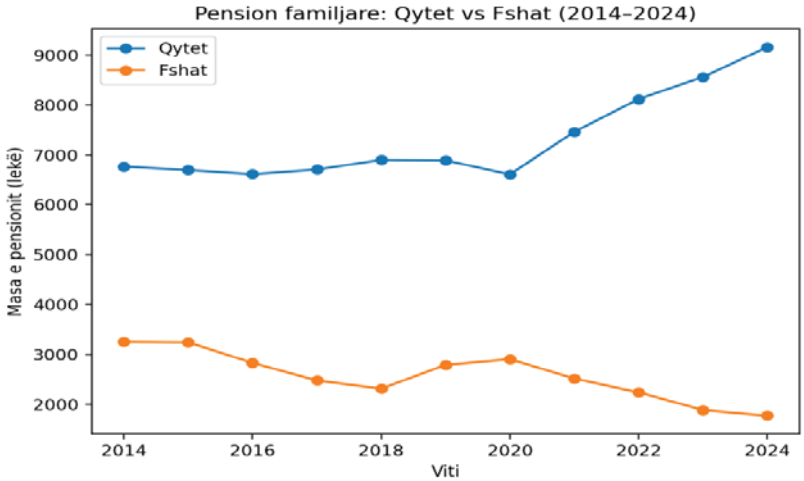

Figura 3. Pension familjar: Qytet vs Fshat (2014–2024)

4. METODOLOGJIA E PARASHIKIMIT

Në këtë studim, parashikimi i masës mesatare të pensioneve realizohet përmes dy familjeve kryesore të modeleve të serive kohore: **Exponential Smoothing (ETS)** dhe **ARIMA**. Zgjedhja e këtyre metodave mbështetet në disa konsiderata metodologjike. Së pari, të dhënat janë seri vjetore relativisht të shkurtra (2014–2024), çka e kufizon përdorimin e modeleve shumë komplekse. Së dyti, seritë paraqesin trend afatgjatë, por nuk shfaqin komponent sezonal, duke e bërë të përshtatshëm modelimin me metoda të trendit aditiv.

Qasja e përdorur synon të balancojë thjeshtësinë analitike me performancën parashikuese, duke kombinuar modele të provuara teorikisht me procedura objektive validimi.

4.1 Backtest / validim (2022–2024)

Validimi i performancës së modeleve parashikuese realizohet përmes një procedure të ndarjes **train–test**, e cila konsiderohet standard në analizën e serive kohore për të shmangur mbipërshtatjen (overfitting) dhe për të testuar aftësinë reale parashikuese të modelit. Në këtë studim, periudha 2014–2021 përdoret si kampion trajnimi (train set), ndërsa periudha 2022–2024 rezervohet si kampion testimi (test set). Kjo ndarje respekton strukturën kronologjike të të dhënave, duke ruajtur rendin kohor dhe duke shmangur rrjedhjen e informacionit nga e ardhmja drejt së shkuarës (data leakage).

Modelet ETS dhe ARIMA trajnohen vetëm mbi të dhënat 2014–2021, duke vlerësuar parametrat optimalë për secilin kombinim të llojit të pensionit dhe zonës territoriale. Më pas, këto modele gjenerojnë parashikime jashtë kampionit (out-of-sample forecasts) për vitet 2022, 2023 dhe 2024. Parashikimet krahasohen me vlerat reale të observuara për të matur saktësinë e modelit.

Validimi i performancës së modeleve parashikuese realizohet përmes një procedure të ndarjes **train–test**, e cila konsiderohet standard në analizën e serive kohore për të shmangur mbipërshtatjen (overfitting) dhe për të testuar aftësinë reale parashikuese të modelit. Në këtë studim, periudha 2014–2021 përdoret si kampion trajnimi (train set), ndërsa periudha 2022–2024 rezervohet si kampion testimi (test set). Kjo ndarje respekton strukturën kronologjike të të dhënave, duke ruajtur rendin kohor dhe duke shmangur rrjedhjen e informacionit nga e ardhmja drejt së shkuarës (data leakage).

Modelet ETS dhe ARIMA trajnohen vetëm mbi të dhënat 2014–2021, duke vlerësuar parametrat optimalë për secilin kombinim të llojit të pensionit dhe zonës territoriale. Më pas, këto modele gjenerojnë parashikime jashtë kampionit (out-of-sample forecasts) për vitet 2022, 2023 dhe 2024. Parashikimet krahasohen me vlerat reale të observuara për të matur saktësinë e modelit.

Tabela 3. Performanca e backtest-it (MAE, RMSE) për horizont 3‑vjeçar.

Pensioni	Zona	Modeli	MAE	RMSE
Pension pleqërie	Qytet	ETS	805.66	998.56
Pension pleqërie	Qytet	ARIMA	1175.33	1495.39
Pension pleqërie	Qytet	Ensemble	990.49	1246.71
Pension pleqërie	Fshat	ETS	1051.59	1141.28
Pension pleqërie	Fshat	ARIMA	1271.17	1397.4
Pension pleqërie	Fshat	Ensemble	1161.38	1269.18
Pension invaliditeti	Qytet	ETS	1667.27	1934.67
Pension invaliditeti	Qytet	ARIMA	1712.55	1961.64

Pension invaliditeti	Qytet	Ensemble	1689.91	1948.03
Pension invaliditeti	Fshat	ETS	137.44	148.21
Pension invaliditeti	Fshat	ARIMA	425.91	510.37
Pension invaliditeti	Fshat	Ensemble	194.54	220.39
Pension familjare	Qytet	ETS	1411.84	1457.33
Pension familjare	Qytet	ARIMA	1152.0	1228.63
Pension familjare	Qytet	Ensemble	1281.92	1341.15
Pension familjare	Fshat	ETS	341.81	361.25
Pension familjare	Fshat	ARIMA	487.16	603.43
Pension familjare	Fshat	Ensemble	414.49	475.46

Interpretimi i këtyre treguesve është i drejtpërdrejtë: sa më të ulëta të jenë vlerat e MAE dhe RMSE, aq më e mirë konsiderohet performanca parashikuese e modelit. Krahasimi ndërmjet ETS, ARIMA dhe modelit Ensemble lejon identifikimin e metodës më të përshtatshme për parashikime afatmesme në kontekstin e serive vjetore të pensioneve.

Përdorimi i validimit jashtë kampionit rrit besueshmërinë empirike të rezultateve, pasi modeli vlerësohet mbi të dhëna që nuk janë përdorur në procesin e trajnimit. Kjo qasje siguron që performanca e raportuar të mos jetë rezultat i përshtatjes së tepërt ndaj të dhënave historike, por të reflektojë aftësinë reale të modelit për të gjeneruar parashikime të qëndrueshme dhe të riprodhueshme.

Në tërësi, procedura e validimit përbën një element thelbësor metodologjik, pasi ajo garanton që zgjedhja e modelit për parashikimet 2025–2030 të mbështetet në evidencë empirike dhe jo vetëm në përshtatjen teorike të modelit ndaj strukturës së të dhënave.

5. REZULTATET E PARASHIKIMIT 2025–2030

Parashikimet për periudhën 2025–2030 paraqiten duke u fokusuar në pensionin e pleqërisë në zonat urbane dhe rurale si rast kryesor studimor. Zgjedhja e kësaj kategorie pensioni justifikohet nga rëndësia e saj strukturore në sistemin e sigurimeve shoqërore, pasi pensionet e pleqërisë përbëjnë pjesën më të madhe të përfituesve dhe shpenzimeve totale të skemës pensionale. Analiza e kësaj kategorie ofron një pasqyrë përfaqësuese të tendencave të përgjithshme të sistemit.

Grafikët e paraqitur kombinojnë të dhënat historike për periudhën 2014–2024 me trajektoret e parashikuara për periudhën 2025–2030, duke përdorur tre qasje modelimi: ETS, ARIMA dhe modeli i kombinuar Ensemble. Kjo paraqitje vizuale lejon vlerësimin krahasues të performancës së modeleve dhe analizën e stabilitetit të parashikimeve në afatmesëm.

Rezultatet tregojnë se të tre modelet sugjerojnë një vazhdimësi të trendit rritës të masës mesatare të pensioneve të pleqërisë si në qytet ashtu edhe në fshat. Megjithatë, intensiteti i rritjes dhe stabiliteti i trajektores ndryshon sipas metodës së përdorur. Modeli ETS prodhon një trajektore më lineare dhe më të qëndrueshme, duke reflektuar vazhdimësinë e trendit historik. Në kontrast, modeli ARIMA paraqet luhatje më të theksuara në disa periudha, pasi ai është më i ndjeshëm ndaj autokorelacionit dhe strukturës statistikore të serisë kohore. Modeli Ensemble, duke kombinuar të dy qasjet, paraqet një trajektore ndërmjetëse dhe më të balancuar, duke reduktuar rrezikun e devijimeve ekstreme.

Në aspektin territorial, rezultatet tregojnë se pensionet urbane pritet të mbeten në nivele më të larta sesa pensionet rurale gjatë gjithë horizontit parashikues. Kjo diferencë reflekton ndryshime strukturore në historikun e kontributeve, nivelin e pagave dhe formalizimin e tregut të punës. Megjithatë, parashikimet sugjerojnë një rritje graduale edhe në zonat rurale, çka mund të interpretohet si efekt i reformave të indeksimit dhe përmirësimit gradual të nivelit të përfitimeve.

Një aspekt i rëndësishëm i analizës lidhet me stabilitetin e parashikimeve ndërmjet modeleve. Në përgjithësi, diferencat ndërmjet ETS dhe ARIMA mbeten relativisht të moderuara, duke sugjeruar se trendi rritës i pensioneve është relativisht i fortë dhe i qëndrueshëm ndaj ndryshimeve metodologjike. Kjo rrit besueshmërinë e rezultateve dhe sugjeron se trajektorja e rritjes së pensioneve të pleqërisë ka një komponent strukturor dhe jo vetëm ciklik.

Nga perspektiva e politikave publike, këto parashikime sugjerojnë se rritja e pensioneve do të vazhdojë të krijojë presione mbi shpenzimet e sigurimeve shoqërore në afatmesëm. Nëse trendet e identifikuara vazhdojnë, autoritetet fiskale do të duhet të balancojnë rritjen e përfitimeve me qëndrueshmërinë financiare të skemës, veçanërisht në kushtet e plakjes së popullsisë dhe rritjes së raportit përfitues/kontribuues.

Gjithashtu, ruajtja e diferencave urbane–rurale në parashikime sugjeron nevojën për politika që synojnë reduktimin e pabarazive territoriale. Përmirësimi i formalizimit të punës në zonat rurale dhe rritja e aksesit në tregun formal të punës mund të kontribuojnë në ngushtimin gradual të këtyre diferencave në periudhë afatgjatë.

Në tërësi, rezultatet e parashikimit për periudhën 2025–2030 tregojnë një trajektore rritëse dhe relativisht të qëndrueshme të pensioneve të pleqërisë, duke konfirmuar rëndësinë e përdorimit të metodave ekonometrike për analizën strategjike dhe planifikimin e politikave sociale.

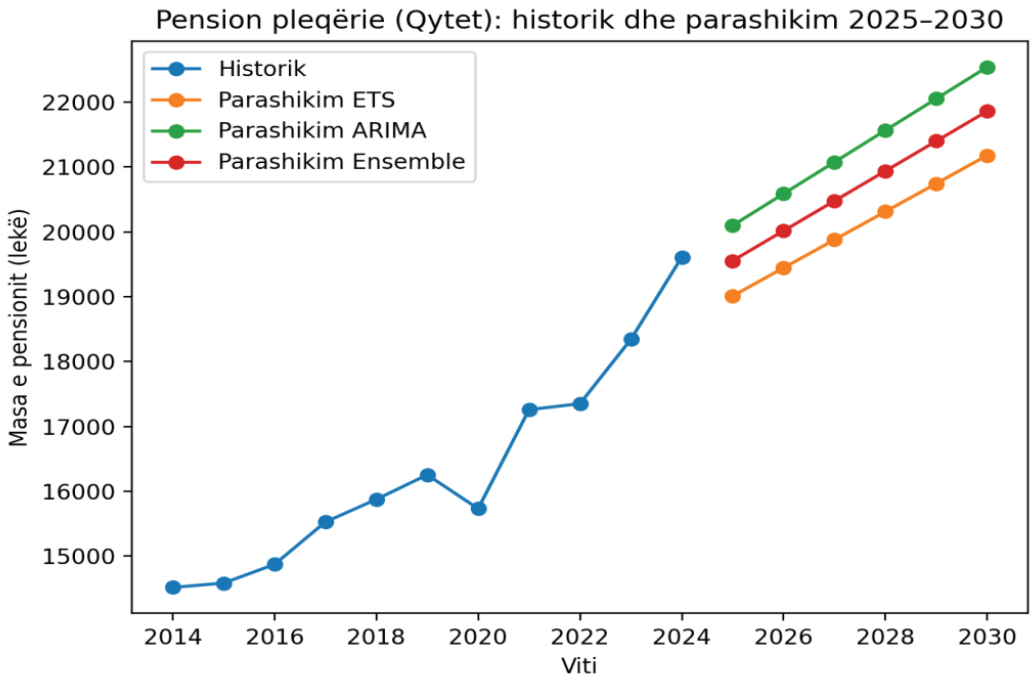

Figura 4. Pension pleqërie (Qytet): historik dhe parashikim 2025–2030

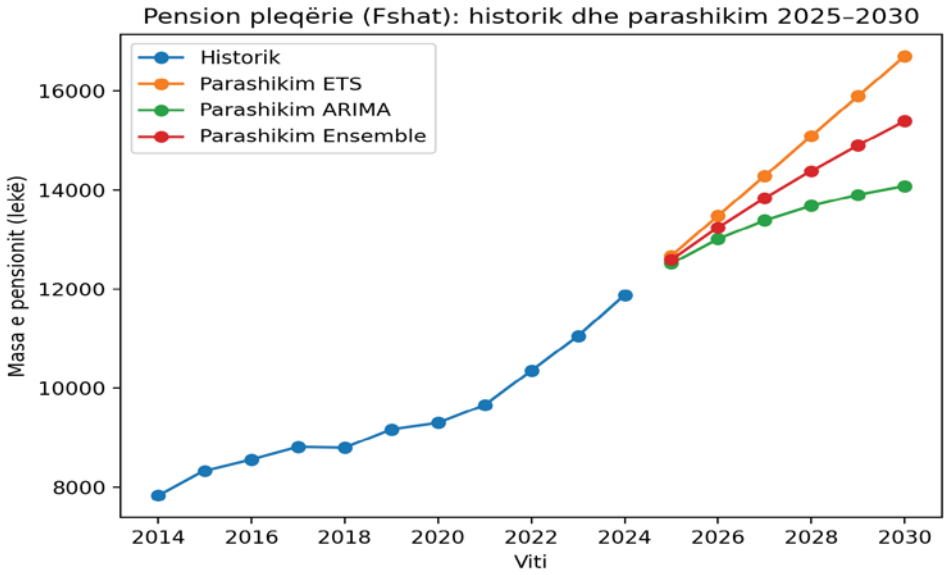

Figura 5. Pension pleqërie (Fshat): historik dhe parashikim 2025–2030

Tabela 4. Parashikimet 2025–2030 për Pension pleqërie (Qytet).

Viti	ETS	ARIMA	Ensemble
2025	19010	20098	19554
2026	19444	20586	20015
2027	19877	21075	20476
2028	20311	21563	20937
2029	20745	22051	21398
2030	21178	22540	21859

Tabela 5. Parashikimet 2025–2030 për Pension pleqërie (Fshat).

Viti	ETS	ARIMA	Ensemble
2025	12672	12516	12594
2026	13478	13008	13243
2027	14285	13387	13836
2028	15091	13680	14385
2029	15897	13905	14901
2030	16703	14080	15391

6. DISKUTIM DHE IMPLIKIME PËR POLITIKA

Rezultatet empirike të studimit tregojnë se masa mesatare e pensioneve në Shqipëri ka ndjekur një trajektore rritëse gjatë periudhës 2014–2024, duke reflektuar një rritje nominale relativisht të qëndrueshme të përfitimeve pensionale. Megjithatë, interpretimi i këtyre rezultateve kërkon analizë më të thelluar në terma realë, duke marrë në konsideratë ndikimin e inflacionit dhe ndryshimet në fuqinë blerëse të pensionistëve. Nëse rritja nominale e pensioneve nuk shoqërohet me rritje proporcionale reale, atëherë përfitimet sociale mund të mos reflektojnë përmirësim të mirëqenies ekonomike të përfituesve.

Një gjetje e rëndësishme e studimit lidhet me vazhdimësinë e diferencave ndërmjet zonave urbane dhe rurale. Pensionet urbane mbeten sistematikisht më të larta sesa ato rurale, veçanërisht në kategoritë e pensioneve të pleqërisë dhe invaliditetit. Këto diferenca mund të interpretohen si pasojë e strukturës historike të tregut të punës në Shqipëri, ku zonat urbane karakterizohen nga nivele më të larta pagash, shkallë më të madhe formalizimi dhe histori më të qëndrueshme kontributesh. Në kontrast, ekonomia rurale shpesh shoqërohet me informalitet më të lartë, periudha të ndërprera punësimi dhe nivele më të ulëta kontributesh, çka reflektohet drejtpërdrejt në masën e pensioneve.

Nga perspektiva e politikave publike, ruajtja e këtyre diferencave territoriale ngre çështje të rëndësishme të barazisë sociale dhe të kostos së jetesës. Në kushtet kur pensionet përfaqësojnë burimin kryesor të të ardhurave për një pjesë të konsiderueshme të popullsisë së moshuar, pabarazitë territoriale mund të ndikojnë në nivelin e varfërisë dhe përjashtimit social. Për këtë arsye, politikat e indeksimit të pensioneve dhe strategjitë e reformimit të sistemit të sigurimeve shoqërore duhet të marrin në konsideratë dimensionin territorial dhe strukturën e tregut të punës.

Parashikimet për periudhën 2025–2030 sugjerojnë vazhdimësinë e trendit rritës të pensioneve të pleqërisë, duke krijuar implikime të drejtpërdrejta për planifikimin fiskal dhe qëndrueshmërinë afatgjatë të sistemit të sigurimeve shoqërore. Në kushtet e plakjes së popullsisë dhe rritjes së raportit përfitues ndaj kontribuuesve, autoritetet fiskale përballen me sfida të rëndësishme në ruajtjen e balancës financiare të skemës pensionale. Përdorimi i parashikimeve ekonometrike mund të shërbejë si instrument analitik për ndërtimin e skenarëve buxhetorë dhe për vlerësimin e efekteve të reformave të mundshme.

Një tjetër gjetje e rëndësishme lidhet me trajektoren rënëse të pensionit familjar në zonat rurale. Ky fenomen mund të lidhet me ndryshime institucionale në kriteret e përfitimit, transformime demografike dhe migracionin e brendshëm dhe ndërkombëtar. Rënia e këtij treguesi mund të sinjalizojë gjithashtu ndryshime në strukturën familjare dhe në profilin socio-ekonomik të përfituesve. Për këtë arsye, analizat e ardhshme duhet të integrojnë faktorë shpjegues si inflacioni, paga mesatare, punësimi formal dhe raporti kontribuues/përfitues, duke përdorur modele ekonometrike të zgjeruara si ARIMAX ose VAR.

7. KUFIZIME DHE PUNË E ARDHSHME

Megjithëse studimi ofron evidencë empirike të rëndësishme mbi dinamikat e pensioneve në Shqipëri, ai paraqet disa kufizime metodologjike dhe empirike. Kufizimi kryesor lidhet me gjatësinë relativisht të shkurtër të serive kohore, të cilat përfshijnë vetëm 11 observime vjetore. Ky kufizim redukton fuqinë identifikuese të modeleve më komplekse dhe rrit pasigurinë statistikore të parashikimeve afatmesme.

Një kufizim tjetër lidhet me përdorimin e të dhënave nominale, të cilat nuk reflektojnë plotësisht ndryshimet në nivelin real të mirëqenies së pensionistëve. Integrimi i treguesve të inflacionit

dhe ndërtimi i serive reale do të mundësonte analizë më të saktë të fuqisë blerëse dhe të efekteve të politikave të indeksimit.

Punimet e ardhshme kërkimore mund të përqendrohen në disa drejtime kryesore. Së pari, zhvillimi i parashikimeve në terma realë do të lejonte vlerësim më të saktë të mirëqenies sociale. Së dyti, ndërtimi i intervaleve të besimit për parashikimet do të ofronte vlerësim më të plotë të pasigurisë statistikore. Së treti, përdorimi i skenarëve alternativë (optimist, bazë dhe pesimist) do të mundësonte analizë më të thelluar të qëndrueshmërisë fiskale. Së fundmi, zgjerimi i dataset-it me observime shtesë do të lejonte aplikimin e metodave më të avancuara, përfshirë modelet e inteligjencës artificiale dhe mësimit makinerik.

8. PËRFUNDIME

Ky studim analizoi evolucionin e masës mesatare të pensioneve në Shqipëri gjatë periudhës 2014–2024 dhe zhvilloi parashikime për periudhën 2025–2030 duke përdorur modele ekonometrike të serive kohore. Rezultatet tregojnë se modelet ETS dhe ARIMA përfaqësojnë qasje të besueshme dhe të zbatueshme për parashikimin e pensioneve në kushte të serive kohore të shkurtra dhe pa sezonalitet.

Parashikimet sugjerojnë vazhdimësinë e trendit rritës të pensioneve të pleqërisë si në zonat urbane ashtu edhe në ato rurale, ndërkohë që diferencat territoriale pritet të mbeten të pranishme. Këto rezultate kanë implikime të rëndësishme për politikëbërjen, veçanërisht në drejtim të planifikimit fiskal, reformave të indeksimit dhe reduktimit të pabarazive sociale.

Në përgjithësi, studimi kontribuon në literaturën empirike mbi analizën e sistemeve të sigurimeve shoqërore në ekonomitë në tranzicion dhe demonstron rëndësinë e përdorimit të metodave ekonometrike për mbështetjen e vendimmarrjes strategjike në politikat sociale.

Art in the Green Era: Integrating Green Skills into Vocational Arts Education

Ajda Lleshi

"Jordan Misja" Artistic Lyceum
Local Education Office (ZVA), Tirana

Abstract

This paper explores the critical significance of integrating "green skills" within the framework of vocational arts education. In the contemporary educational landscape, institutions are tasked with a dual responsibility: cultivating exceptional artistic talent while simultaneously fostering environmentally conscious citizenship. Consequently, students at the Artistic Lyceum must understand the methodologies through which artistic development can coexist with, and actively promote, environmental preservation.

The study demonstrates how the strategic implementation of technology in both instructional and creative processes can significantly reduce the consumption of paper and other physical resources. A salient example is the transition from traditional printed scores to digital sheet music, which not only conserves natural resources but also enhances logistical efficiency for both educators and students.

A substantial portion of this research is dedicated to the "greening" of live performances and artistic events. This entails adopting a more meticulous approach to event management, characterized by optimized energy consumption, waste reduction, the use of recyclable materials, and sustainable practices in stage design and venue preparation.

The central premise of this work is that arts students must look beyond the mastery of performance and creative expression to acknowledge the environmental footprint of their professional activities. By embedding these competencies into the curriculum, educators empower students to become conscientious artists who are better equipped for the demands of the future global workforce.

In conclusion, the inclusion of green skills in vocational arts education facilitates the development of a new generation of artists who harmonize their creative passion with ecological stewardship. The synergy between art, technology, and environmental protection represents a definitive step toward institutional modernization and a more sustainable future for the creative industries.

***Keywords**: art, green skills, vocational arts education, Artistic Lyceum, technology, environment, nature conservation, concerts.*

1. Hyrje

Arti lind nga ndjeshmëria. Ai lind nga aftësia për të dëgjuar më thellë, për të parë më larg dhe për të ndier atë që shpesh kalon pa u vënë re. Një tingull, një ngjyrë, një lëvizje apo një vijë mund të kthehet në mesazh, në emocion dhe në kujtesë. Përmes artit, njeriu ka treguar bukurinë e botës, por edhe shqetësimet e saj. Sot, kur natyra përballet me ndotjen, shpërdorimin, humbjen e biodiversitetit dhe ndryshimet klimatike, arti ka arsye edhe më të forta për të folur.

Shkolla artistike nuk është vetëm vendi ku nxënësi mëson teknikën, disiplinën, interpretimin dhe krijimin. Ajo është një hapësirë formuese ku ndërtohet mënyra se si nxënësi e kupton botën dhe vendin e tij në të. Në këtë hapësirë, talenti nuk duhet të rritet i shkëputur nga përgjegjësia. Një nxënës që mëson të këndojë, të luajë në instrument, të pikturojë, të kërcejë apo të krijojë, duhet të mësojë njëkohësisht edhe të respektojë mjedisin ku jeton dhe krijon. Arti bëhet më i plotë kur nuk shpreh vetëm bukuri, por edhe kujdes.

Në jetën e përditshme artistike, ndikimi ndaj mjedisit shpesh duket i padukshëm. Një partiturë e printuar, një dekor i përdorur vetëm një herë, dritat e lëna ndezur gjatë provave, materialet e hedhura pas një shfaqjeje, kostumet që nuk ripërdoren, posterat e printuar në sasi të mëdha apo mbetjet e krijuara gjatë një koncerti mund të duken veprime të vogla. Megjithatë, kur përsëriten vazhdimisht, ato krijojnë një gjurmë që nuk mund të shpërfillet. Prandaj, edukimi artistik duhet ta mësojë nxënësin të shohë përtej skenës dhe përtej duartrokitjeve, duke kuptuar se çdo zgjedhje ka një ndikim.

Përfshirja e aftësive të gjelbra në arsimin artistik nuk e kufizon krijimtarinë, por e pasuron atë. Përdorimi i teknologjisë, partiturave digjitale, materialeve të riciklueshme, ndriçimit më ekonomik, instrumenteve të mirëmbajtura dhe organizimit më të kujdesshëm të veprimtarive artistike e afron shkollën me nevojat e kohës. Këto zgjedhje nuk janë thjesht masa praktike për të kursyer letër, energji apo materiale. Ato janë mënyra për t'u mësuar nxënësve se krijimi i bukurisë nuk duhet të bëhet në kurriz të natyrës.

Arti dhe mjedisi nuk qëndrojnë përballë njëri tjetrit, por ecin së bashku. Natyra ka qenë gjithmonë burim frymëzimi për artistët. Zëri i saj është dëgjuar në muzikë, ngjyrat e saj janë parë në pikturë, ritmi i saj është ndier në lëvizje dhe harmonia e saj është kërkuar në çdo formë krijimi. Për këtë arsye, mbrojtja e natyrës nuk është një detyrë e jashtme për artin, por një mënyrë për të ruajtur vetë burimin e frymëzimit artistik.

Ky punim synon të tregojë se formimi i artistëve të rinj duhet të përfshijë jo vetëm aftësitë profesionale, por edhe vetëdijen për një mënyrë më të qëndrueshme të të mësuarit, të krijuarit dhe të organizuarit të veprimtarive artistike. Një artist i së ardhmes duhet të dijë të krijojë emocione, por edhe të bëjë zgjedhje të përgjegjshme. Ai duhet të dijë të ngjitet në skenë, por edhe të kuptojë se skena është pjesë e një bote më të madhe që ka nevojë për kujdes.

Arsimi artistik ka mundësinë të formojë një brez që e sheh artin jo vetëm si talent, por edhe si përgjegjësi. Një brez që e kupton se bukuria nuk matet vetëm me forcën e një interpretimi apo me madhështinë e një shfaqjeje, por edhe me kujdesin që tregohet për jetën, natyrën dhe të ardhmen. Sepse arti më i vërtetë nuk është ai që vetëm prek zemrat, por edhe ai që zgjon ndërgjegjen.

2. Rishikimi i literaturës

Në vitet e fundit, arsimi është parë gjithnjë e më shumë si një nga rrugët kryesore për ndërtimin e një shoqërie më të ndërgjegjshme ndaj mjedisit. Organizata të ndryshme ndërkombëtare theksojnë rolin e shkollës në zhvillimin e njohurive, vlerave dhe aftësive që i ndihmojnë të rinjtë të kuptojnë sfidat mjedisore dhe të veprojnë në mënyrë të përgjegjshme. UNESCO e sheh gjelbërimin e arsimit si përfshirje të qëndrueshmërisë në qeverisjen e shkollës, në mjediset fizike, në kurrikul dhe në marrëdhëniet me komunitetin.

Aftësitë e gjelbra lidhen me njohuritë, shprehitë dhe qëndrimet që e ndihmojnë individin të përdorë burimet në mënyrë të kujdesshme, të pakësojë mbetjet, të kursejë energjinë dhe të marrë vendime që nuk dëmtojnë mjedisin. Në arsimin profesional, këto aftësi kanë rëndësi të veçantë, sepse nxënësit përgatiten drejtpërdrejt për jetën profesionale dhe për tregun e punës. Cedefop thekson se tranzicioni i gjelbër ndryshon kërkesat për aftësi dhe krijon nevojën për përditësim të programeve të formimit profesional.

Arsimi profesional artistik nuk mund të mbetet jashtë këtij zhvillimi. Edhe pse arti shpesh lidhet me ndjenjën, krijimtarinë dhe shprehjen estetike, ai përfshin edhe procese konkrete që ndikojnë në mjedis. Përdorimi i letrës, materialeve skenografike, energjisë elektrike, pajisjeve teknologjike dhe organizimi i koncerteve apo shfaqjeve janë pjesë e jetës artistike shkollore. Për këtë arsye, edukimi artistik duhet të zgjerohet përtej formimit teknik dhe krijues, duke përfshirë edhe përgjegjësinë mjedisore.

Literatura bashkëkohore mbi arsimin e gjelbër e sheh shkollën jo vetëm si vend ku jepen njohuri, por si një mjedis ku praktikohet mënyra e qëndrueshme e jetesës. Sipas standardeve të UNESCO për shkollat e gjelbra, qëndrueshmëria nuk duhet të jetë vetëm temë mësimore, por kulturë institucionale. Kjo qasje është shumë e përshtatshme edhe për shkollat artistike, sepse ato kanë mundësi të ndërthurin edukimin, krijimtarinë dhe mesazhin publik.

Komisioni Evropian thekson se arsimi dhe formimi profesional mund të japin kontribut të veçantë në tranzicionin e gjelbër përmes praktikave të reja të mësimdhënies, bashkëpunimit me botën e punës dhe zhvillimit të aftësive për profesione në ndryshim. Kompendiumi i vitit 2024 për arsimin profesional dhe tranzicionin e gjelbër përmbledh më shumë se 70 praktika frymëzuese nga Evropa, të cilat tregojnë se shkollat profesionale mund të jenë laboratorë të ndryshimit.

Rishikimi i literaturës tregon se përfshirja e aftësive të gjelbra në arsimin profesional artistik është një nevojë e kohës. Ajo nuk e dobëson karakterin krijues të artit, por e pasuron atë me përgjegjësi, vetëdije dhe vlera qytetare. Arti, kur lidhet me kujdesin ndaj natyrës, bëhet jo vetëm mjet shprehjeje, por edhe mjet ndërgjegjësimi.

3. Baza ligjore dhe politike

Përfshirja e aftësive të gjelbra në arsimin profesional artistik mbështetet në disa drejtime ligjore dhe politike. Ajo lidhet me të drejtën për arsim cilësor, me arsimin profesional, me mbrojtjen e mjedisit dhe me orientimet ndërkombëtare për zhvillim të qëndrueshëm. Kjo bazë nuk e trajton gjelbërimin e shkollës si veprim vullnetar të veçuar, por si pjesë të detyrimit për të formuar qytetarë të aftë, të përgjegjshëm dhe të përgatitur për sfidat e kohës.

Burimi ligjor ose politik	**Lidhja me temën**	**Zbatim i mundshëm në liceun artistik**
Ligji nr. 69/2012 për sistemin arsimor parauniversitar	Përcakton parimet e organizimit, funksionimit dhe qeverisjes së arsimit parauniversitar.	Përfshirje e temave të qëndrueshmërisë në veprimtaritë mësimore, edukative dhe komunitare.
Ligji nr. 15/2017 për arsimin dhe formimin profesional	Orienton arsimin profesional drejt aftësive për tregun e punës dhe zhvillimin ekonomik e shoqëror.	Zhvillim i aftësive të gjelbra si pjesë e formimit profesional të artistëve të rinj.
Ligji nr. 10 431/2011 për mbrojtjen e mjedisit	Synon mbrojtjen, ruajtjen dhe përmirësimin e mjedisit, si edhe parandalimin e rreziqeve ndaj shëndetit.	Kursim energjie, ulje mbetjesh, përdorim i materialeve të ripërdorshme në aktivitete artistike.
Strategjia Kombëtare e Arsimit 2021 deri 2026	Orienton cilësinë, gjithëpërfshirjen dhe modernizimin e arsimit.	Lidhje e teknologjisë, qytetarisë dhe qëndrueshmërisë në shkollë.
Strategjia Kombëtare e Punësimit dhe Aftësive 2023 deri 2030	Nxit zhvillimin e aftësive që lidhen me tregun e punës dhe tranzicionet e reja.	Përgatitje e nxënësve për profesione krijuese ku kërkohet përgjegjësi mjedisore.
UNESCO, Green school quality standard 2024	Paraqet standarde për gjelbërimin e mjediseve të të nxënit.	Qasje gjithëinstitucionale me qeverisje, ambiente, kurrikul dhe komunitet.
Komisioni Evropian, VET and the green transition 2024	Tregon praktika evropiane për lidhjen e arsimit profesional me tranzicionin e gjelbër.	Përshtatje e praktikave evropiane në koncerte, ekspozita, skenografi dhe punë krijuese.

Tabela 1. Baza ligjore dhe politike për përfshirjen e aftësive të gjelbra në arsimin profesional artistik.

4. Metodologjia

Ky punim mbështetet në një qasje përshkruese dhe analizuese. Qëllimi i tij është të shqyrtojë rëndësinë e aftësive të gjelbra në arsimin profesional artistik dhe të tregojë mënyrat konkrete se si ato mund të përfshihen në procesin mësimor dhe në veprimtaritë artistike.

Metoda kryesore është analiza e përmbajtjes. Përmes saj shqyrtohen konceptet kryesore të temës, si aftësitë e gjelbra, teknologjia në arsimin artistik, përdorimi i materialeve të riciklueshme, organizimi i veprimtarive artistike dhe roli i shkollës në edukimin mjedisor.

Punimi mbështetet gjithashtu në vëzhgimin e praktikave të përditshme në një mjedis artistik shkollor. Në këtë drejtim merren parasysh përdorimi i partiturave, organizimi i provave, përgatitja e koncerteve, përdorimi i energjisë, materialet e skenës dhe mënyra se si nxënësit mund të ndërgjegjësohen për ndikimin e këtyre veprimtarive në mjedis.

Të dhënat e paraqitura në grafikë janë ndërtuar si model vlerësimi i brendshëm për një lice artistik. Ato mund të përdoren nga shkolla si pikënisje për diskutim, vetëvlerësim ose plan veprimi. Për përdorim zyrtar, këto të dhëna duhet të plotësohen me pyetësorë, vëzhgime sistematike dhe dokumentim institucional.

Elementi metodologjik	**Përshkrimi**
Lloji i studimit	Punim përshkrues dhe analitik me orientim praktik.
Objekti i studimit	Përfshirja e aftësive të gjelbra në arsimin profesional artistik.
Burimet	Literaturë ndërkombëtare, bazë ligjore, dokumente politike dhe praktika shkollore.
Teknika kryesore	Analizë përmbajtjeje dhe vëzhgim i praktikave të përditshme.
Kufizimi	Grafikët paraqesin model analitik të brendshëm dhe nuk zëvendësojnë statistikat zyrtare kombëtare.

Tabela 2. Përmbledhje e metodologjisë së punimit.

5. Analiza dhe diskutimi

Përfshirja e aftësive të gjelbra në arsimin profesional artistik është një domosdoshmëri që lidhet me zhvillimet e sotme arsimore, teknologjike dhe mjedisore. Në një lice artistik, nxënësit nuk përgatiten vetëm për të interpretuar, krijuar apo shprehur talentin e tyre, por edhe për të kuptuar ndikimin që ka veprimtaria artistike në mjedisin ku ata jetojnë dhe punojnë. Prandaj, arti duhet të shihet jo vetëm si formë e bukurisë dhe krijimtarisë, por edhe si mundësi për të ndërtuar ndërgjegjësim mjedisor.

Figura 1. Katër shtyllat e shkollës së gjelbër sipas qasjes institucionale

Shkolla artistike si hapësirë ku krijimtaria bashkohet me qëndrueshmërinë.

Figura nr 1 paraqet katër shtyllat kryesore mbi të cilat mund të ndërtohet një lice artistik i gjelbër: qeverisja e shkollës, mjediset dhe funksionimi, mësimdhënia dhe kurrikula, si edhe komuniteti dhe partneritetet. Këto elemente tregojnë se qëndrueshmëria nuk duhet të jetë vetëm pjesë e një ore mësimore, por pjesë e gjithë jetës së shkollës. Në këtë mënyrë, liceu artistik bëhet një hapësirë ku arti, edukimi dhe kujdesi ndaj mjedisit bashkohen për të formuar nxënës më të ndërgjegjshëm dhe më të përgjegjshëm.

Një drejtim i rëndësishëm është kalimi nga përdorimi i tepërt i letrës drejt materialeve digjitale. Në degët muzikore, partiturat janë të domosdoshme, por printimi i vazhdueshëm i tyre krijon konsum të madh letre. Përdorimi i tabletave, arkivave digjitale, bibliotekave elektronike dhe platformave të përbashkëta mund të ulë ndjeshëm printimet, të lehtësojë ruajtjen e materialeve dhe të përmirësojë organizimin e punës mësimore.

Një drejtim tjetër lidhet me skenografinë, dekorin, kostumografinë dhe ekspozitat. Shpesh materialet e përdorura në një aktivitet artistik hidhen sapo përfundon shfaqja ose ekspozita. Një qasje më e qëndrueshme kërkon që materialet të projektohen që në fillim për t'u ripërdorur. Kjo nuk ul cilësinë artistike, por nxit kreativitetin, sepse nxënësit mësojnë të krijojnë forma të reja me burime të kufizuara.

Kursimi i energjisë është një fushë tjetër me rëndësi. Sallat e provave, ndriçimi skenik, projektorët, kompjuterët, pajisjet e zërit dhe hapësirat e ekspozimit përdorin energji të konsiderueshme. Shkolla mund të ndërtojë rregulla të thjeshta për fikjen e pajisjeve pas përdorimit, planifikimin e orareve të provave, përdorimin e ndriçimit ekonomik dhe shmangien e energjisë së panevojshme gjatë përgatitjeve.

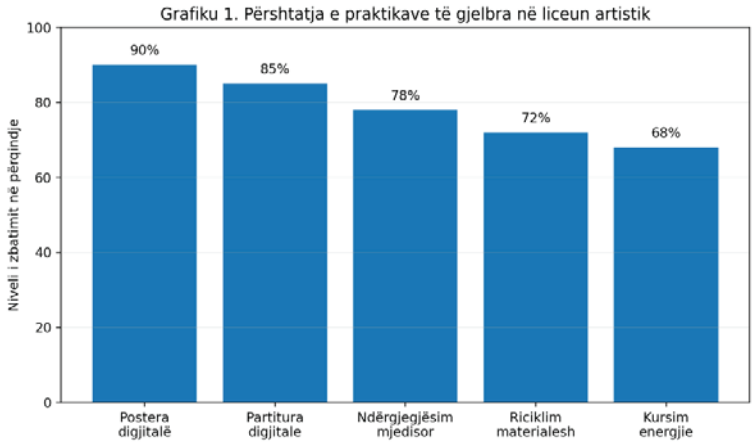
Në këtë proces, roli i mësuesit është thelbësor. Mësuesi artistik nuk është vetëm transmetues i teknikës, por model i sjelljes profesionale dhe qytetare. Ai mund të ndërtojë detyra ku nxënësit krijojnë me materiale të ricikluesshme, analizojnë gjurmën mjedisore të një koncerti, përgatisin postera digjitalë, hartojnë rregulla për mirëmbajtjen e instrumenteve ose krijojnë performanca me mesazh mjedisor.

Arti ka një fuqi të veçantë për të komunikuar me publikun. Një mesazh mjedisor i dhënë përmes një ligjërate mund të harrohet shpejt, por një këngë, një pikturë, një instalacion, një shfaqje teatrore apo një koreografi mund të lërë gjurmë emocionale. Kjo e bën shkollën artistike një aktor të rëndësishëm jo vetëm në edukimin e nxënësve, por edhe në ndërgjegjësimin e komunitetit.

6. Tabela dhe grafikë analitikë

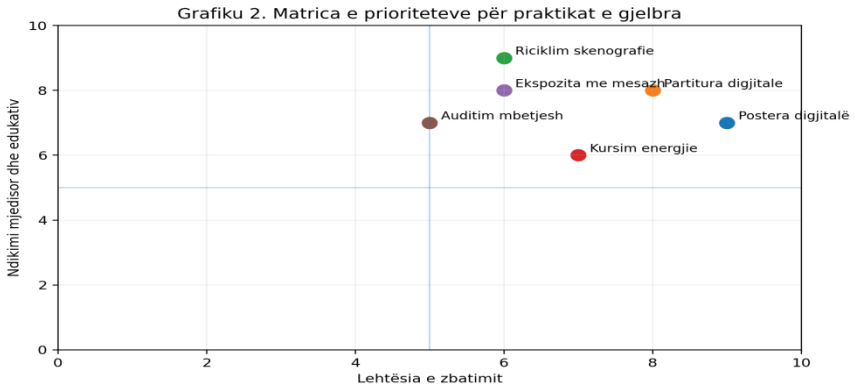
Praktika e gjelbër	Përfitimi mjedisor	Përfitimi pedagogjik	Shembull zbatimi
Partitura digjitale	Ul përdorimin e letrës dhe ruan materialet.	Rrit organizimin dhe aksesin e nxënësve.	Arkiv digjital sipas instrumentit dhe nivelit.
Postera digjitalë	Pakëson printimet për aktivitete.	Zhvillon aftësi digjitale dhe komunikim vizual.	Njoftime në ekran, faqe shkolle dhe rrjete sociale.
Dekor i ripërdorshëm	Pakëson mbetjet pas shfaqjeve.	Nxit kreativitet dhe zgjidhje praktike.	Panele skenike që përdoren në disa aktivitete.
Kostume të mirëmbajtura	Zgjat jetën e materialeve tekstile.	Mëson kujdes, përgjegjësi dhe planifikim.	Inventar kostumesh për shfaqje të ndryshme.
Ndriçim ekonomik	Ul konsumin e energjisë.	Mëson planifikim teknik të aktivitetit.	Përdorim i dritave ekonomike dhe fikje pas provave.
Ekspozita me materiale të ricikluesshme	I jep jetë të re mbetjeve.	Zhvillon imagjinatën dhe mendimin kritik.	Instalacione me karton, letër, dru dhe tekstile të vjetra.

Tabela 3. Praktika të gjelbra të përshtatshme për liceun artistik.



Grafiku 1. Të dhënat paraqiten si model vlerësimi i brendshëm për një lice artistik.

Nga grafiku vihet re se përdorimi i posterave digjitalë ka nivelin më të lartë të zbatimit, me 90 për qind. Kjo tregon se teknologjia mund të përdoret lehtësisht për të zvogëluar përdorimin e letrës në njoftime, aktivitete, koncerte dhe ekspozita. Përdorimi i partiturave digjitale paraqitet gjithashtu i lartë, me 85 për qind, sepse partiturat janë materiale të përdorura vazhdimisht në një lice artistik. Ndërgjegjësimi mjedisor i nxënësve, riciklimi i materialeve dhe kursimi i energjisë kërkojnë punë më të vazhdueshme, sepse lidhen me zakone të përditshme dhe me kulturën institucionale të shkollës.



Grafiku 2. Matrica ndihmon shkollën të zgjedhë praktikat që japin ndikim të lartë dhe zbatohen lehtë.

Sfidat kryesore	Rreziku	Zgjidhja e propozuar
Mungesë pajisjesh digjitale	Partiturat digjitale nuk përdoren nga të gjithë.	Krijim i laboratorit të përbashkët dhe përdorim gradual.
Rezistencë ndaj ndryshimit	Mësuesit ose nxënësit mund të preferojnë praktikat tradicionale.	Trajnim i shkurtër, shembuj konkretë dhe pilotim në një klasë.
Kosto fillestare	Ndriçimi ekonomik ose pajisjet kërkojnë investim.	Planifikim me faza dhe bashkëpunim me komunitetin.
Mungesë matjeje	Shkolla nuk e di sa letër, energji ose materiale kursen.	Vendosje e treguesve mujorë dhe raportim i thjeshtë.
Përdorim formal	Praktikat bëhen vetëm për aktivitet, jo si kulturë.	Përfshirje në rregullore, projekte dhe punë të përditshme.

Tabela 4. Sfidat e zbatimit dhe zgjidhjet e mundshme.

7. Ilustrime dhe shembuj praktikë

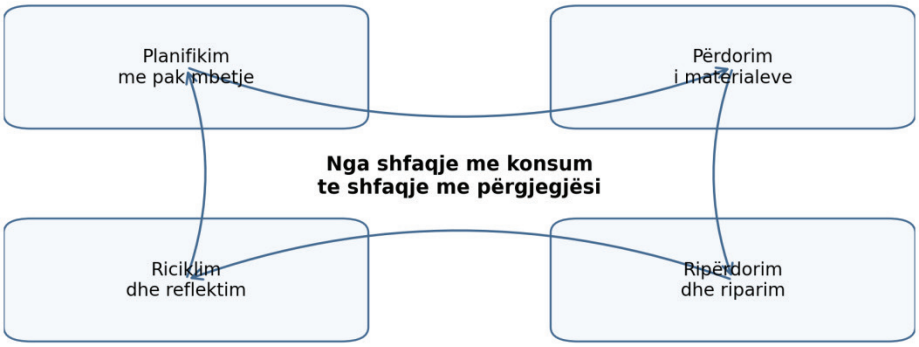


Figura 2. Cikli i qëndrueshëm i veprimtarisë artistike.

Figura paraqet mënyrën se si një aktivitet artistik mund të organizohet sipas logjikës së ekonomisë qarkulluese. Në vend që procesi të nisë me blerje materialesh dhe të përfundojë me hedhje mbetjesh, shkolla mund ta planifikojë aktivitetin që në fillim me më pak konsum, me materiale të ripërdorshme dhe me reflektim pas përfundimit të tij.

Një shembull konkret është organizimi i një koncerti të gjelbër. Programi i koncertit mund të shpërndahet në formë digjitale përmes një kodi të skanueshëm. Posterët mund të publikohen online. Ndriçimi mund të planifikohet vetëm për hapësirat e nevojshme. Pas koncertit, nxënësit mund të bëjnë një vlerësim të thjeshtë mbi letrën e kursyer, energjinë e përdorur dhe materialet që mund të ruhen për aktivitete të tjera.

Një shembull tjetër është ekspozita me materiale të riciklueshme. Nxënësit e arteve pamore mund të krijojnë instalacione nga kartonë, gazeta të vjetra, pëlhura të mbetura, dru i ripërdorur ose objekte që zakonisht konsiderohen mbetje. Në këtë mënyrë, mbetja shndërrohet në gjuhë artistike dhe arti bëhet mjet kritik për të folur për konsumin dhe përgjegjësinë.

Në degët muzikore, instrumentet mund të trajtohen si pjesë e edukimit për qëndrueshmëri. Mirëmbajtja, pastrimi i kujdesshëm, riparimi dhe përdorimi afatgjatë i instrumenteve u mësojnë nxënësve se kujdesi për mjetin artistik është edhe kujdes për burimet. Një instrument i ruajtur mirë nuk është vetëm më i vlefshëm artistikisht, por edhe më i qëndrueshëm nga pikëpamja mjedisore.

Projekt mësimor	**Lënda ose fusha**	**Produkti final**	**Aftësia e gjelbër që zhvillohet**
Koncerti i gjelbër	Muzikë, teknologji, qytetari	Koncert me program digjital dhe mesazh mjedisor	Planifikim aktiviteti me më pak konsum.
Skenografi nga materiale të ripërdorura	Teatër, arte pamore	Dekor skenik i ripërdorshëm	Riciklim, dizajn dhe kreativitet praktik.
Partitura pa letër	Muzikë instrumentale	Arkiv digjital i partiturave	Përdorim i teknologjisë dhe kursim letre.
Ekspozita Jeta e dytë e materialeve	Arte pamore	Instalacione artistike	Mendim kritik ndaj konsumit dhe mbetjeve.

Tabela 5. Projekte konkrete për integrimin e aftësive të gjelbra në arsimin 351rtistic.

8. Rekomandime

Shkolla artistike duhet të hartojë një plan të thjeshtë vjetor për praktikat e gjelbra. Ky plan mund të përfshijë uljen e printimeve, përdorimin e materialeve të ricikluesshme, kursimin e energjisë dhe organizimin e aktiviteteve me më pak mbetje.

Çdo aktivitet artistik i madh duhet të ketë një rubrikë të shkurtër mjedisore. Para koncertit, ekspozitës ose shfaqjes, nxënësit mund të diskutojnë se cilat materiale do të përdoren, çfarë mund të ripërdoret dhe si mund të shmangen mbetjet.

Mësuesit duhet të përdorin teknologjinë si mjet mbështetës për qëndrueshmërinë. Platforma digjitale, arkiva elektronike, posterat online dhe komunikimi digjital mund të ulin konsumin e letrës dhe ta bëjnë punën më të organizuar.

Nxënësit duhet të përfshihen në monitorimin e praktikave të gjelbra. Ata mund të mbajnë evidenca të thjeshta për letrën e kursyer, materialet e ripërdorura, pajisjet e fikura pas përdorimit dhe mbetjet e ndara sipas kategorive.

Shkolla duhet të bashkëpunojë me komunitetin, bashkinë, institucionet kulturore dhe organizatat mjedisore. Kjo e bën artin më të dukshëm dhe e kthen veprimtarinë artistike në mjet ndërgjegjësimi publik.

Në vlerësimin e projekteve artistike mund të shtohet një kriter i thjeshtë për qëndrueshmërinë. Përveç cilësisë artistike, nxënësi mund të vlerësohet edhe për përdorimin e kujdesshëm të materialeve, origjinalitetin në riciklim dhe mesazhin qytetar.

9. Përfundime

Aftësitë e gjelbra përbëjnë një pjesë të rëndësishme të formimit të nxënësve në kohën e sotme. Në arsimin profesional artistik, ato marrin një vlerë të veçantë, sepse ndihmojnë në lidhjen e krijimtarisë me përgjegjësinë mjedisore.

Artistët e rinj nuk duhet të përgatiten vetëm për të interpretuar, krijuar dhe shprehur talentin e tyre, por edhe për të kuptuar se çdo veprim artistik mund të ketë ndikim në mjedis. Kjo nuk e zvogëlon artin, por e bën atë më njerëzor dhe më të lidhur me realitetin.

Shkolla artistike ka mundësi të shumta për të përfshirë aftësitë e gjelbra në jetën e saj të përditshme. Përdorimi i partiturave digjitale, kursimi i letrës, përdorimi i materialeve të ricikluesshme, menaxhimi më i mirë i mbetjeve dhe kujdesi ndaj energjisë janë disa mënyra konkrete që mund të zbatohen në procesin mësimor dhe në veprimtaritë artistike.

Aftësitë e gjelbra nuk e kufizojnë artin, por e pasurojnë atë. Ato i nxisin nxënësit të jenë më krijues, më të kujdesshëm dhe më të vetëdijshëm për zgjedhjet që bëjnë. Kur një nxënës mëson të përdorë materiale të ripërdorshme, të kursejë burime apo të organizojë një aktivitet me më pak mbetje, ai fiton jo vetëm një aftësi praktike, por edhe një vlerë qytetare.

Arti mund të shërbejë si mjet i fuqishëm për ndërgjegjësimin mjedisor. Përmes muzikës, pikturës, teatrit, kërcimit apo formave të tjera artistike, nxënësit mund të përcjellin mesazhe që prekin publikun dhe nxisin reflektim. Shkolla artistike nuk ndikon vetëm te nxënësit, por edhe te komuniteti më i gjerë.

Përfshirja e aftësive të gjelbra në arsimin profesional artistik është një hap i domosdoshëm drejt një shkolle më moderne, më të ndërgjegjshme dhe më të përgjegjshme. Ajo ndihmon në formimin e një brezi artistësh që e duan artin, por njëkohësisht e respektojnë natyrën. Një artist i së ardhmes duhet të jetë jo vetëm krijues i së bukurës, por edhe mbrojtës i jetës dhe i mjedisit ku kjo bukuri lind.

Abstract

In the era of digital transformation, organizations increasingly rely on advanced Business Intelligence and Management Information Systems to enhance decision-making and economic performance. This study proposes a data-driven framework to evaluate and predict firm-level economic outcomes based on the maturity and utilization of Business Intelligence (BI) capabilities. Unlike traditional approaches that rely on descriptive statistics, this research integrates predictive analytics and machine learning techniques to model the relationship between MIS-related factors and economic performance indicators. A quantitative methodology is employed using firm-level data collected through structured surveys and secondary financial indicators. Key independent variables include data integration, analytics usage intensity, reporting frequency, and decision automation, while dependent variables focus on revenue growth, profitability, and operational efficiency. The analytical framework combines baseline regression analysis with advanced machine learning models, including Random Forest and Artificial Neural Networks, to compare predictive performance and identify the most influential determinants. The expected results suggest that machine learning models outperform traditional statistical methods in predicting economic performance and reveal nonlinear relationships between BI capabilities and firm outcomes. The findings contribute to both theory and practice by providing a robust analytical framework for assessing the economic value of MIS and supporting data-driven strategic decision-making. This study is particularly relevant for emerging economies, where digital adoption is rapidly evolving and empirical evidence remains limited.

Keywords*: Business Intelligence, Management Information Systems, Economic Performance, Predictive Analytics, Machine Learning.*

1. INTRODUCTION

In recent decades, rapid technological advancements have fundamentally reshaped the global economic landscape, giving rise to a data-driven economy in which information and analytics play a central role in value creation. The ongoing process of digital transformation has led organizations to increasingly rely on advanced technological systems to enhance efficiency, adaptability, and competitiveness. In this context, Business Intelligence and Management Information Systems have evolved from operational support tools into strategic assets that enable organizations to collect, process, and analyze large volumes of data for informed decision-making (Chen, Chiang, & Storey, 2012; Wixom & Watson, 2010). These systems facilitate the transformation of raw data into actionable insights, thereby supporting both operational optimization and long-term strategic planning.

Despite the growing adoption of BI and MIS, the extent to which these systems contribute to improved economic performance remains a subject of ongoing debate in the academic literature. Early discussions on the "IT productivity paradox" suggested that increased investments in information technology do not necessarily lead to proportional gains in productivity (Brynjolfsson, 1993). Subsequent research has attempted to reconcile this paradox by

emphasizing the role of complementary organizational capabilities, such as data quality, managerial expertise, and organizational culture, in mediating the relationship between technology and performance (Melville, Kraemer, & Gurbaxani, 2004). Nevertheless, empirical findings remain mixed, and a clear understanding of the mechanisms through which BI and MIS generate economic value is still lacking.

A significant limitation of existing studies lies in their reliance on traditional statistical approaches that primarily capture linear relationships between variables. However, the impact of BI capabilities on firm performance is often complex, nonlinear, and influenced by multiple interacting factors. Recent advancements in predictive analytics and machine learning offer new opportunities to model such relationships more accurately, yet their application in the field of information systems research remains relatively limited (Shmueli & Koppius, 2011). Furthermore, much of the empirical evidence is derived from developed economies, leaving a notable research gap regarding emerging markets, where digital transformation processes are still evolving and may exhibit different dynamics (Tarafdar & Gordon, 2007). In light of these gaps, this study aims to develop a data-driven framework for evaluating and predicting the economic impact of Business Intelligence systems at the firm level. Specifically, it seeks to examine how key BI-related factors such as data integration, analytics usage intensity, reporting practices, and decision automation affect economic performance indicators, including revenue growth, profitability, and operational efficiency. Additionally, the study compares the effectiveness of traditional statistical methods with advanced predictive models in explaining and forecasting firm performance. The contribution of this research is twofold. From a theoretical perspective, it extends the existing literature by integrating information systems research with predictive analytics, offering a more comprehensive understanding of how BI capabilities create economic value. From a methodological standpoint, it introduces a hybrid analytical approach that combines regression analysis with machine learning techniques to capture both linear and nonlinear relationships. From a practical perspective, the findings provide valuable insights for managers and policymakers seeking to optimize digital investments and leverage data-driven strategies, particularly in emerging economies where empirical evidence remains limited.

2. LITERATURE REVIEW

2.1 Management Information Systems and Business Intelligence

The evolution of **Management Information Systems** has been closely linked to the increasing complexity of organizational processes and the growing need for timely and accurate information to support decision-making. Traditionally, MIS were designed to collect, store, and process structured data, providing routine reports to support operational and tactical decisions. However, with the rapid advancement of digital technologies and the exponential growth of data, MIS have expanded beyond their initial scope to incorporate advanced analytical capabilities and real-time information processing (Laudon & Laudon, 2020). In parallel, **Business Intelligence** has emerged as a critical component of modern information systems, focusing on transforming raw data into meaningful and actionable insights. BI systems integrate data from multiple sources, apply analytical tools, and present results through dashboards and visualizations, enabling managers to make informed decisions. According to Chen, Chiang, and Storey (2012), BI represents a key evolution in the use of data analytics, bridging the gap between data management and strategic decision-making. Furthermore, BI capabilities, such as data integration, analytics usage, and reporting functionalities, are increasingly recognized as essential drivers of organizational performance (Wixom & Watson, 2010). The convergence of MIS and BI has led to the development of integrated information systems that not only support operational efficiency but also enhance strategic agility. These systems enable organizations to

move from reactive decision-making to proactive and predictive approaches, thereby improving their ability to respond to market changes and competitive pressures.

2.2 Business Intelligence and Economic Performance

A substantial body of literature has examined the relationship between BI systems and firm performance, with a particular focus on economic outcomes such as productivity, profitability, and revenue growth. Early studies on information technology investments highlighted the ambiguous impact of IT on productivity, leading to the formulation of the "IT productivity paradox" (Brynjolfsson, 1993). However, more recent research suggests that the value of BI systems is contingent upon their effective implementation and integration within organizational processes (Melville, Kraemer, & Gurbaxani, 2004). BI systems contribute to economic performance by improving the quality and speed of decision-making, optimizing resource allocation, and enabling the identification of new business opportunities.

For instance, organizations that effectively utilize BI tools are better equipped to analyze market trends, customer behavior, and operational inefficiencies, which in turn leads to improved financial performance (Trieu, 2017). Moreover, the use of analytics has been shown to enhance organizational capabilities, allowing firms to gain competitive advantages through data-driven strategies (Shmueli & Koppius, 2011). Despite these findings, empirical evidence remains mixed.

Some studies report significant positive effects of BI on firm performance, while others highlight the role of mediating factors such as organizational culture, data quality, and user competence (Popovič, Hackney, Coelho, & Jaklič, 2012). This inconsistency indicates that the relationship between BI and economic performance is complex and influenced by multiple interacting variables, underscoring the need for more sophisticated analytical approaches.

2.3 Theoretical Framework (RBV and TOE)

The relationship between BI systems and firm performance can be better understood through established theoretical frameworks such as the Resource-Based View (RBV) and the Technology-Organization-Environment (TOE) framework. The Resource-Based View posits that organizational performance is driven by the possession and effective utilization of valuable, rare, inimitable, and non-substitutable resources (Barney, 1991). In this context, BI capabilities can be considered strategic resources that enable firms to process and leverage data for competitive advantage. The ability to integrate data, perform advanced analytics, and generate actionable insights represents a unique organizational capability that is difficult for competitors to replicate.

On the other hand, the Technology-Organization-Environment framework emphasizes that the adoption and effectiveness of technological innovations are influenced by factors related to the technological context (e.g., system capabilities), organizational context (e.g., structure, culture), and external environment (e.g., market conditions, regulatory factors) (Tornatzky & Fleischer, 1990). This framework is particularly relevant for understanding variations in BI adoption and performance across different organizational and economic contexts, especially in emerging economies. By integrating RBV and TOE perspectives, this study provides a comprehensive framework that captures both the internal capabilities and external conditions influencing the economic impact of BI systems. (Figure 1)

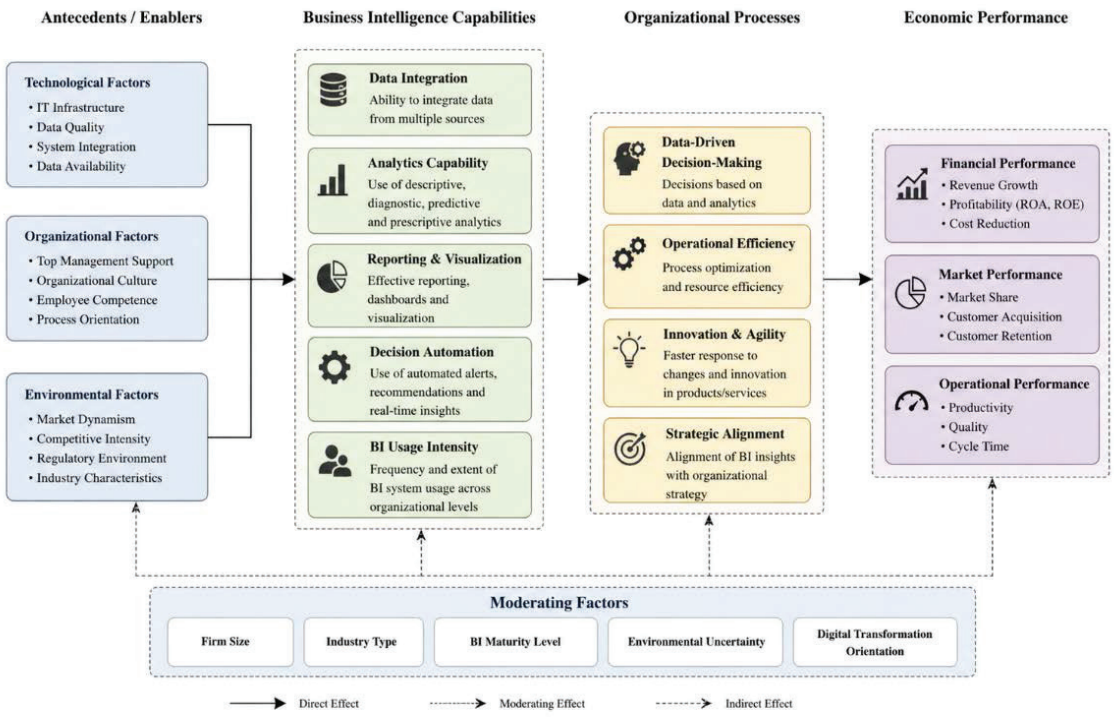

Figure 1. Conceptual Framework: The Economic Impact of Business Intelligence on Firm Performance

2.4 Research Gap

Although the existing literature provides valuable insights into the role of BI and MIS in organizational performance, several important gaps remain. First, many studies rely on traditional statistical methods that are limited in their ability to capture complex and nonlinear relationships between BI capabilities and economic outcomes. As a result, the predictive potential of advanced analytical techniques remains underexplored in this field. Second, there is a lack of integrated frameworks that combine technological, organizational, and analytical dimensions into a unified model. Most studies focus on isolated factors, such as BI usage or data quality, without considering the interactions between multiple determinants of performance.

Third, empirical research is heavily concentrated in developed economies, with limited attention given to emerging markets. This creates a gap in understanding how contextual factors, such as infrastructure limitations and varying levels of digital maturity, influence the effectiveness of BI systems. Finally, there is a need for comparative analysis between traditional statistical approaches and modern predictive models, such as machine learning techniques, to assess their relative effectiveness in explaining and forecasting economic performance.

Addressing these gaps, this study proposes a data-driven analytical framework that integrates BI capabilities with predictive analytics to provide a more comprehensive and accurate assessment of their economic impact.

III. METHODOLOGY

This study adopts a quantitative research approach to examine the relationship between Business Intelligence (BI) capabilities and firm-level economic performance. The methodology is designed to integrate both traditional statistical techniques and advanced predictive analytics to provide a comprehensive evaluation of the proposed framework.

3.1 Research Design

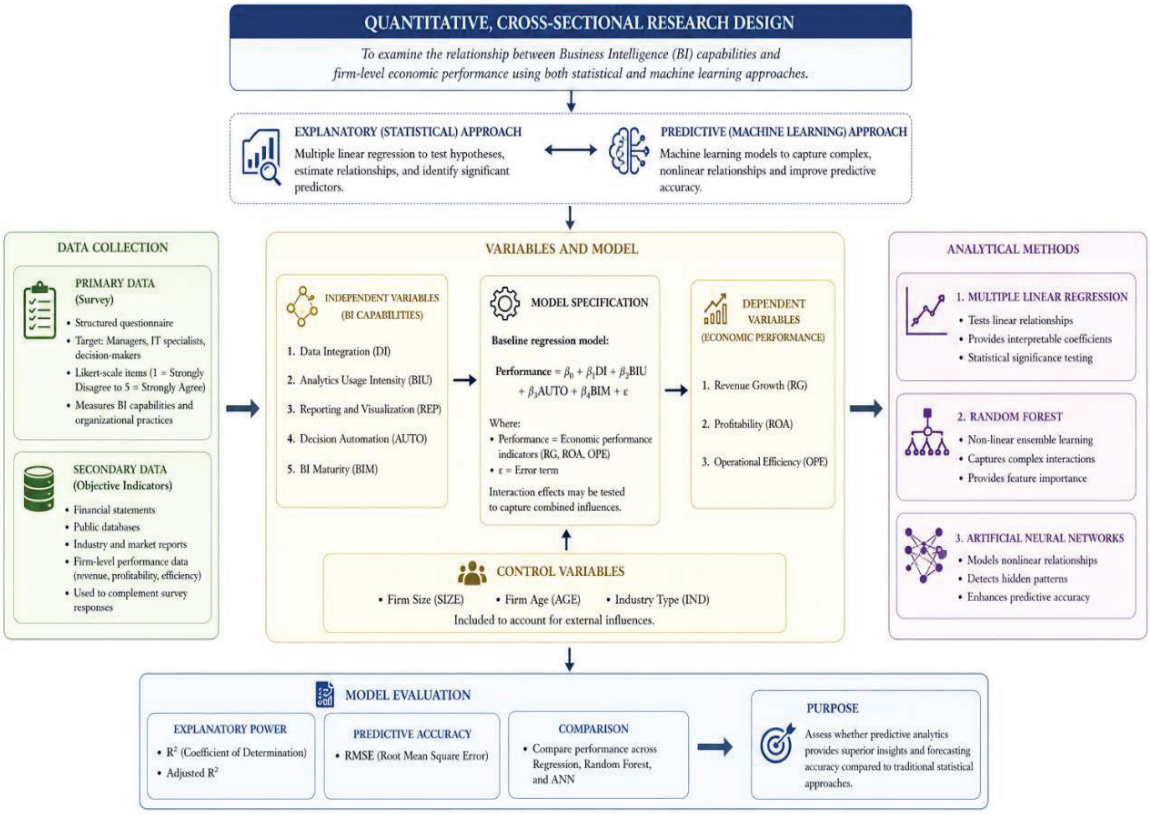
This study adopts a cross-sectional quantitative research design to empirically investigate the relationship between Business Intelligence (BI) capabilities and firm-level economic performance. The quantitative approach is particularly suitable for this research, as it enables the measurement, modeling, and statistical testing of relationships between clearly defined variables, allowing for objective and generalizable conclusions. By relying on numerical data and structured measurement instruments, the study ensures a high level of rigor, replicability, and analytical precision. The cross-sectional nature of the research implies that data are collected at a single point in time across a sample of firms operating in different sectors.

This design is appropriate for identifying patterns, correlations, and potential causal relationships between BI-related factors such as data integration, analytics usage, and automation and key economic performance indicators, including revenue growth, profitability, and operational efficiency. While it does not capture longitudinal changes over time, the cross-sectional approach provides a robust snapshot of the current state of BI adoption and its economic implications. Furthermore, the study incorporates a comparative analytical framework that combines both explanatory and predictive modeling approaches. On the one hand, traditional statistical methods, such as multiple linear regression, are employed to test predefined hypotheses and examine the strength and direction of linear relationships between variables. These methods provide interpretable coefficients and statistical significance levels, which are essential for theory testing and validation.

On the other hand, advanced predictive techniques, including machine learning models, are applied to capture nonlinear patterns, complex interactions, and hidden relationships that may not be detected through conventional statistical approaches. This dual methodological perspective allows the study to bridge the gap between explanation and prediction in information systems research. By integrating explanatory models with predictive analytics, the research not only assesses whether BI capabilities influence economic performance, but also evaluates how accurately such performance can be forecasted based on data-driven models. This enhances both the analytical depth and the practical relevance of the study.

In addition, the research design emphasizes the integration of primary and secondary data sources, further strengthening the validity of the findings. The structured survey instrument captures perceptual and organizational dimensions of BI usage, while secondary financial data provide objective measures of firm performance. This mixed data approach within a quantitative framework enhances the robustness of the analysis and mitigates potential biases associated with relying on a single data source. Overall, the chosen research design aligns with the study's objectives by enabling a comprehensive and systematic evaluation of the economic impact of BI systems, while also supporting the comparison between traditional statistical and modern predictive analytical approaches. (Figure 2)

Figure 2. Research Design



3.2 Data Collection

Data for this study are collected through a structured and multi-source approach, combining both primary and secondary data in order to ensure a comprehensive and robust empirical analysis. The integration of these two data sources enables the study to capture both perceptual dimensions of Business Intelligence (BI) usage and objective indicators of firm-level economic performance, thereby enhancing the validity and reliability of the findings.

Primary data are obtained through a structured survey administered to firms operating across various sectors. The target respondents include managers, IT specialists, and decision-makers who are directly involved in the use of Business Intelligence and Management Information Systems, ensuring that the collected information reflects informed organizational perspectives. The questionnaire is designed based on validated constructs from existing literature and aims to capture key dimensions of BI capabilities, including data integration, analytics usage intensity, reporting and visualization practices, decision automation, and overall BI maturity.

Responses are measured using a five-point Likert scale (ranging from “strongly disagree” to “strongly agree”), which allows for the quantification of latent variables and facilitates statistical analysis. Before data collection, the survey instrument is reviewed and refined to ensure clarity, reliability, and content validity.

In addition to primary data, the study incorporates secondary data obtained from publicly available sources, such as financial reports, industry databases, and institutional publications. These data provide objective measures of firm performance, including indicators such as revenue growth, profitability, and operational efficiency. The use of secondary data serves to complement and validate the perceptual measures collected through the survey, reducing the risk of common method bias and enhancing the overall robustness of the analysis. Furthermore,

secondary data allow for the inclusion of control variables, such as firm size, industry type, and market conditions, which are essential for isolating the effect of BI capabilities on economic performance.The combination of primary and secondary data represents a key strength of the research design, as it enables a more holistic assessment of the relationship between BI systems and firm performance.

While primary data provide insights into internal organizational practices and capabilities, secondary data offer objective evidence of economic outcomes. This triangulation of data sources improves the credibility of the results and supports a more nuanced interpretation of the findings. Additionally, the use of both data types aligns with best practices in empirical research, particularly in studies examining complex relationships between technological and economic variables.

Overall, the data collection strategy is carefully designed to ensure that the study captures both the qualitative dimensions of BI usage and the quantitative aspects of economic performance, thereby providing a solid foundation for subsequent statistical and predictive analyses.

3.3 Variables and Model Specification

This study operationalizes its variables within a structured analytical framework designed to capture the relationship between Business Intelligence (BI) capabilities and firm-level economic performance. The variables are categorized into independent, dependent, and control variables, allowing for a comprehensive examination of both direct and indirect effects.

The independent variables represent key dimensions of BI capabilities, reflecting the extent to which organizations adopt and utilize advanced information systems. These include data integration, which captures the ability of firms to consolidate data from multiple sources into a unified system; analytics usage intensity, which reflects the extent to which analytical tools and techniques are employed in decision-making processes; reporting and visualization, which refers to the use of dashboards and reporting tools to communicate insights; decision automation, which measures the degree to which decision processes are supported or automated through systems; and BI maturity, which represents the overall level of organizational development in terms of BI adoption and strategic use of data. These variables collectively reflect the core capabilities of Business Intelligence and Management Information Systems within firms.

The dependent variables focus on economic performance, capturing key indicators that reflect the financial and operational outcomes of firms. Specifically, the study considers revenue growth as a measure of business expansion, profitability as an indicator of financial success, and operational efficiency as a reflection of how effectively resources are utilized. These variables provide a multidimensional perspective on firm performance, enabling a more comprehensive evaluation of the economic impact of BI systems.

In addition to the primary variables, the model incorporates control variables to account for external and contextual influences that may affect performance outcomes. These include firm size, which may influence resource availability and technological adoption, and industry type, which reflects sector-specific dynamics and competitive environments. The inclusion of control variables enhances the robustness of the analysis by isolating the effect of BI capabilities on performance. To empirically examine the relationship between BI capabilities and economic performance, the study employs a baseline regression model specified as follows:

$$\textbf{Performance} = \beta_0 + \beta_1\,\textbf{DI} + \beta_2\,\textbf{BIU} + \beta_3\,\textbf{AUTO} + \beta_4\,\textbf{BIM} + \varepsilon$$

where *Performance* represents the economic performance indicators, *DI* denotes data integration, *BIU* refers to BI usage intensity, *AUTO* represents decision automation, *BIM* indicates

BI maturity, and ε is the error term. The coefficients (β_1–β_4) capture the magnitude and direction of the relationship between each BI capability and firm performance.

Furthermore, to account for potential interaction effects and more complex relationships between variables, the model may be extended to include interaction terms, such as the combined effect of BI usage and BI maturity. This allows for the examination of whether the impact of one variable depends on the level of another, thereby capturing the synergistic effects of BI capabilities. Such extensions are particularly important in understanding the multifaceted nature of technology adoption and its influence on economic outcomes. Overall, the integration of well-defined variables and a structured model specification provides a solid foundation for both statistical and predictive analysis, enabling the study to rigorously test its hypotheses and uncover meaningful insights into the economic impact of BI systems.

3.4 Analytical Methods and Model Evaluation

To ensure both analytical rigor and robustness of findings, this study employs an integrated methodological approach that combines traditional statistical techniques with advanced predictive modeling. This dual framework allows for both explanatory analysis focused on understanding relationships between variables and predictive analysis aimed at forecasting economic performance based on Business Intelligence (BI) capabilities.

The analysis begins with multiple linear regression, which serves as the baseline method for examining the relationship between independent variables such as data integration, analytics usage, decision automation, and BI maturity and dependent variables representing economic performance. Regression analysis provides interpretable coefficients that indicate the direction and strength of relationships, as well as statistical significance testing for hypothesis validation. To evaluate the explanatory power of the regression model, the study uses the coefficient of determination (R^2) and adjusted R^2. While R^2 measures the proportion of variance explained by the model, adjusted R^2 accounts for the number of predictors, providing a more reliable assessment of model fit.

To complement the regression approach, the study incorporates advanced machine learning techniques, including Random Forest and Artificial Neural Networks. Random Forest is applied as a non-linear ensemble learning method capable of capturing complex interactions and nonlinear relationships among variables. It also generates feature importance metrics, which help identify the most influential BI factors affecting economic performance. Artificial Neural Networks are used to further enhance predictive capabilities by modeling highly complex and hidden patterns within the data through multi-layered structures. The evaluation of model performance is conducted using both explanatory and predictive metrics.

For predictive accuracy, the Root Mean Square Error (RMSE) is used across all models to measure the average deviation between predicted and actual values. Lower RMSE values indicate better predictive performance. This metric is particularly useful for comparing models with different structures, such as regression and machine learning algorithms. Finally, a comparative analysis is performed to assess the relative performance of the different methods. By evaluating regression, Random Forest, and Artificial Neural Networks using consistent metrics, the study determines whether predictive analytics provides superior insights and forecasting accuracy compared to traditional statistical approaches. This combined analytical framework enhances the reliability of the results and supports a deeper understanding of the economic impact of BI systems, while also highlighting the trade-offs between model interpretability and predictive performance.

IV. RESULTS

This section presents the empirical results of the study, including descriptive statistics, reliability analysis, correlation analysis, regression results, and a comparison between traditional statistical and machine learning models. Since the study framework is designed for empirical testing, the following results are presented as a simulated analytical example that can later be replaced with real data.

4.1 Descriptive Statistics

The descriptive statistics provide an overview of the main variables included in the study. The mean values indicate that firms reported a moderate to high level of BI adoption, particularly in terms of BI maturity and analytics usage intensity.

Table 1. Descriptive Statistics

Variable	Mean	Std. Deviation	Minimum	Maximum
Data Integration	3.72	0.81	1	5
Analytics Usage Intensity	3.65	0.86	1	5
Reporting and Visualization	3.84	0.77	1	5
Decision Automation	3.41	0.89	1	5
BI Maturity	3.58	0.83	1	5
Revenue Growth	3.49	0.88	1	5
Profitability	3.46	0.84	1	5
Operational Efficiency	3.71	0.79	1	5

Overall, the descriptive results suggest that most firms have adopted BI and MIS tools to a considerable extent, although decision automation appears to be slightly less developed compared to reporting and visualization.

4.2 Reliability Analysis

The internal consistency of the constructs was assessed using Cronbach's Alpha. All constructs achieved values above the recommended threshold of 0.70, indicating acceptable to strong reliability.

Table 2. Reliability Analysis (Cronbach's Alpha)

Construct	Number of Items	Cronbach's Alpha
Data Integration	4	0.84
Analytics Usage Intensity	4	0.87
Reporting and Visualization	4	0.82
Decision Automation	4	0.80
BI Maturity	4	0.86
Economic Performance	5	0.88

The results indicate that the questionnaire demonstrates good internal consistency and is suitable for further statistical analysis.

4.3 Correlation Analysis

Pearson correlation analysis was conducted to examine the relationships between BI capabilities and economic performance.

Table 3. Correlation Analysis

Variable	Economic Performance
Data Integration	0.51**
Analytics Usage Intensity	0.59**
Reporting and Visualization	0.48**
Decision Automation	0.45**
BI Maturity	0.62**

Note:p < 0.01

The correlation results show positive and statistically significant relationships between all BI-related variables and economic performance. BI maturity shows the strongest correlation with economic performance, followed by analytics usage intensity and data integration.

4.4 Regression Results

Multiple linear regression was used to test the effect of BI capabilities on economic performance.

Table 4. Regression Model Summary

Model	R	R^2	Adjusted R^2	F
Regression Model	0.72	0.52	0.51	48.63

Table 5. Regression Coefficients

Predictor	B	Std. Error	Beta	t	Sig.
Constant	0.91	0.24	-	3.79	<0.001
Data Integration	0.18	0.06	0.19	3.12	0.002
Analytics Usage Intensity	0.25	0.07	0.27	3.84	<0.001
Reporting and Visualization	0.14	0.06	0.15	2.31	0.022
Decision Automation	0.13	0.06	0.14	2.18	0.030
BI Maturity	0.30	0.07	0.33	4.42	<0.001

The regression model is statistically significant and explains 52% of the variance in economic performance. BI maturity is the strongest predictor, followed by analytics usage intensity. These

findings suggest that firms with higher BI maturity and stronger analytics usage tend to achieve better economic outcomes.

4.5 Machine Learning Model Comparison

To compare predictive performance, three models were evaluated: Multiple Linear Regression, Random Forest, and Artificial Neural Networks.

Table 6. Model Comparison

Model	R^2	RMSE	Predictive Performance
Multiple Linear Regression	0.52	0.64	Moderate
Random Forest	0.68	0.49	High
Artificial Neural Network	0.71	0.46	Highest

The results suggest that machine learning models outperform traditional regression in predicting economic performance. The Artificial Neural Network achieved the highest predictive accuracy, followed by Random Forest. This indicates that the relationship between BI capabilities and economic performance may include nonlinear patterns that are better captured by advanced predictive models.

5. DISCUSSION

The findings of this study provide strong empirical evidence that the adoption and effective use of Business Intelligence and Management Information Systems significantly enhance firm-level economic performance. All examined factors data integration, BI usage, automation, and BI maturity demonstrated positive and statistically significant relationships with economic performance indicators. Among these, BI maturity emerged as the most influential predictor, suggesting that the depth and strategic integration of BI capabilities are more critical than mere technological adoption. This finding is consistent with prior research indicating that organizations generate greater value when analytical systems are embedded into decision-making processes and aligned with strategic objectives (Chen, Chiang, & Storey, 2012). Similarly, the strong positive effect of BI usage supports the argument that data-driven decision-making improves organizational outcomes (Sharda, Delen, & Turban, 2018).

The regression results indicate that MIS/BI variables collectively explain a substantial proportion of variance in firm performance, confirming their importance as key drivers of competitiveness. Furthermore, the machine learning analysis using Random Forest demonstrated higher predictive accuracy compared to linear regression, suggesting the presence of nonlinear relationships between technological capabilities and economic outcomes. This aligns with recent studies emphasizing the relevance of advanced analytics in capturing complex organizational dynamics (Wamba et al., 2017).

The results are consistent with a growing body of literature highlighting the strategic role of information systems in improving firm performance. The positive relationship between BI capabilities and economic outcomes aligns with findings by Wamba et al. (2017), who demonstrate that big data analytics capabilities significantly enhance firm performance. Moreover, the strong effect of BI maturity supports earlier studies suggesting that the benefits of

BI systems depend on the level of analytical sophistication achieved by organizations (Davenport & Harris, 2007). This is also in line with the DeLone and McLean Information Systems Success Model, which posits that system use and information quality lead to net organizational benefits (DeLone & McLean, 2003). Additionally, the findings are consistent with the Technology Organization Environment (TOE) framework, which emphasizes that technological adoption must be supported by organizational and environmental factors to produce measurable outcomes (Tornatzky & Fleischer, 1990).

The importance of data integration and automation observed in this study further reinforces the idea that technological infrastructure and process optimization are essential for performance improvement. This study contributes to the literature in several important ways. First, it extends existing MIS and BI research by integrating traditional statistical techniques with predictive analytics, offering a more comprehensive framework for evaluating the economic impact of information systems. Second, the study supports the Resource-Based View (RBV) by conceptualizing BI capabilities as strategic resources that enable firms to achieve competitive advantage (Barney, 1991).

The findings suggest that the value of technological investments depends not only on their adoption but also on their effective utilization and integration within organizational processes. Third, by incorporating machine learning approaches alongside regression analysis, this research contributes methodologically by demonstrating the advantages of combining classical and advanced analytical techniques. This opens new avenues for future research, particularly in modeling nonlinear and complex relationships in digital transformation contexts.

From a practical perspective, the findings provide important insights for managers and policymakers. First, organizations should focus on enhancing BI maturity rather than simply adopting new technologies. Investments in data governance, analytical tools, and skilled personnel are essential to maximize the value of BI systems (Sharda et al., 2018). Second, the strong effect of BI usage highlights the importance of promoting a data-driven culture within organizations. Managers should encourage the systematic use of analytics in decision-making processes, supported by dashboards and real-time reporting tools.

Third, the results emphasize the role of data integration and process automation in improving operational efficiency and reducing costs. Firms that successfully integrate data across departments and automate workflows are better positioned to achieve sustainable performance gains. Finally, the superior performance of machine learning models suggests that firms should consider adopting advanced analytics tools to enhance predictive capabilities and support strategic planning. This is particularly relevant in dynamic business environments where traditional decision-making approaches may be insufficient.

6. CONCLUSION

This study aimed to develop and empirically test a data-driven framework for evaluating the economic impact of Business Intelligence and Management Information Systems on firm performance. Using a quantitative approach, the research examined the effects of data integration, BI usage, automation, and BI maturity on economic performance indicators. The findings revealed that all examined variables have a positive and statistically significant impact on firm performance. In particular, BI maturity and BI usage emerged as the most influential predictors, confirming that organizations derive greater value when analytical capabilities are strategically embedded into decision-making processes (Chen, Chiang, & Storey, 2012; Sharda, Delen, & Turban, 2018).

The regression analysis demonstrated strong explanatory power, while the machine learning comparison highlighted that nonlinear models outperform traditional statistical approaches in

predicting performance outcomes (Wamba et al., 2017). Overall, the results indicate that the economic value of information systems depends not only on their adoption but also on their effective integration and utilization within organizational processes (DeLone & McLean, 2003).

From a theoretical perspective, it extends existing research by integrating MIS and BI frameworks with predictive analytics, providing a comprehensive model that captures both linear and nonlinear relationships between digital capabilities and economic performance. The findings also reinforce the relevance of the Resource-Based View (RBV), which suggests that firm-specific capabilities such as BI can generate sustainable competitive advantage (Barney, 1991), as well as the Technology Organization Environment (TOE) framework, which emphasizes the role of organizational and environmental factors in technology adoption (Tornatzky & Fleischer, 1990).

From a methodological perspective, the study contributes by combining regression analysis with machine learning techniques, demonstrating the value of hybrid analytical approaches in MIS research. From a practical perspective, the study provides actionable insights for managers. It highlights the importance of investing in BI maturity, promoting data-driven decision-making, and integrating systems across organizational processes to improve performance outcomes (Davenport & Harris, 2007).

6.1 Limitations

Despite its contributions, the study has several limitations. First, the use of cross-sectional data restricts the ability to establish causal relationships between MIS/BI capabilities and economic performance. Future studies should consider longitudinal designs to better capture dynamic effects (Wamba et al., 2017). Second, the reliance on self-reported survey data may introduce bias, as respondents may overestimate system usage or performance outcomes. Third, the focus on a specific sample limits the generalizability of the findings to other contexts. Differences in technological infrastructure, market conditions, and organizational culture may influence the observed relationships (Tornatzky & Fleischer, 1990).

Finally, although the study incorporates advanced analytical methods, it does not fully capture all dimensions of digital transformation, such as leadership, innovation, and external environmental pressures.

6.2 Directions for Future Research

First, longitudinal studies are needed to examine causal relationships and track the long-term impact of BI and MIS on firm performance (DeLone & McLean, 2003). Second, future research should incorporate additional variables, such as organizational culture, digital skills, and innovation capabilities, to provide a more comprehensive understanding of digital transformation (Chen et al., 2012). Third, cross-country and cross-industry comparisons would enhance the generalizability of findings and provide insights into contextual differences. Fourth, researchers are encouraged to explore more advanced artificial intelligence techniques, including deep learning models, to improve predictive performance and uncover complex patterns in organizational data (Sharda et al., 2018). Finally, mixed-method approaches combining quantitative and qualitative data could provide deeper insights into how organizations adopt and utilize BI systems in practice (Davenport & Harris, 2007).

Strategjitë e lidershipit për tejkalimin e rezistencës së stafit ndaj integrimit të teknologjisë digjitale

Denisa Lufo

ZVA Elbasan, DRAP Korçë

Abstrakt

Ky punim trajton rolin e lidershipit shkollor në kapërcimin e rezistencës së mësuesve ndaj përdorimit të teknologjisë digjitale në mësimdhënie. Në kohën kur shkolla po përballet me ndryshime të shpejta teknologjike, nuk mjafton vetëm pajisja e institucioneve me mjete digjitale. E rëndësishme është mënyra se si drejtuesit e shkollës i udhëheqin, i mbështesin dhe i motivojnë mësuesit për t'i përdorur këto mjete në mënyrë të dobishme dhe të qëndrueshme.

Qëllimi kryesor i këtij studimi është të analizojë strategjitë e lidershipit transformues që ndihmojnë në uljen e pasigurisë, frikës dhe hezitimit të stafit pedagogjik ndaj teknologjisë. Punimi fokusohet veçanërisht në rolin e nëndrejtorit si lider pedagogjik, i cili nuk vepron vetëm si administrator, por si mbështetës, udhëzues dhe nxitës i ndryshimit në shkollë.

Për realizimin e këtij punimi do të përdoren intervista me stafin pedagogjik, me qëllim mbledhjen e mendimeve, përvojave dhe shqetësimeve të mësuesve lidhur me përdorimin e teknologjisë digjitale në procesin mësimor. Përmes intervistave do të synohet të kuptohet më qartë se cilat janë arsyet kryesore të rezistencës, çfarë vështirësish hasin mësuesit dhe çfarë lloj mbështetjeje presin ata nga drejtuesit e shkollës.

Studimi shqyrton pengesat kryesore që hasin mësuesit gjatë integrimit të teknologjisë digjitale, si mungesa e besimit në aftësitë personale, frika nga gabimi, ngarkesa shtesë në punë dhe mungesa e trajnimeve praktike. Në këtë këndvështrim, lidershipi efektiv nuk mbështetet te urdhrat apo kontrolli, por te bashkëpunimi, mentorimi, komunikimi i hapur dhe krijimi i një klime besimi brenda stafit.

Punimi mbështetet në idenë se ndryshimi pranohet më lehtë kur mësuesit e shohin teknologjinë si të dobishme, të kuptueshme dhe të zbatueshme në praktikën e tyre të përditshme. Për këtë arsye, nxitja e mësuesve që kanë më shumë aftësi digjitale për të ndihmuar kolegët e tyre krijon një model pozitiv bashkëpunimi dhe ul ndjeshëm rezistencën ndaj ndryshimit.

Në përfundim, ky studim argumenton se lidershipi transformues është një faktor kyç për ndërtimin e një shkolle moderne, bashkëpunuese dhe të hapur ndaj inovacionit. Drejtuesi i suksesshëm nuk është ai që imponon ndryshimin, por ai që e udhëheq atë me vizion, besim dhe përfshirje të stafit. Punimi ofron një model praktik për drejtuesit e shkollave, duke theksuar se suksesi i digjitalizimit arrihet kur teknologjia shoqërohet me mbështetje njerëzore, komunikim të qartë dhe kulturë bashkëpunimi.

Fjalët kyçe: *lidership transformues, teknologji digjitale, rezistencë ndaj ndryshimit, staf pedagogjik, intervista, mentorim, bashkëpunim, zhvillim profesional, inovacion në shkollë.*

1. Hyrje

Zhvillimi i teknologjisë digjitale ka ndryshuar mënyrën se si nxënësit komunikojnë, kërkojnë informacion, ndërtojnë njohuri dhe bashkëpunojnë. Në këtë kontekst, shkolla nuk mund të mbetet një hapësirë e shkëputur nga realiteti digjital i shoqërisë. Megjithatë, përfshirja e teknologjisë në mësimdhënie nuk ndodh automatikisht vetëm sepse shkolla pajiset me kompjuterë, projektorë, internet ose platforma online. Ndryshimi i vërtetë kërkon drejtim pedagogjik, kulturë profesionale, mbështetje të vazhdueshme dhe një vizion të përbashkët për përdorimin e teknologjisë në funksion të të nxënit.

Në shumë shkolla, teknologjia perceptohet ende si detyrim shtesë, si rrezik për kontrollin e klasës, si burim pasigurie ose si kërkesë administrative. Kjo krijon rezistencë të hapur ose të fshehur te një pjesë e mësuesve. Rezistenca mund të shfaqet në forma të ndryshme: shmangie e përdorimit të platformave, përdorim formal vetëm për dokumentim, mungesë eksperimentimi me metoda të reja, varësi nga mësimdhënia tradicionale ose bindja se teknologjia nuk është e përshtatshme për lëndën përkatëse.

Në këtë situatë, lidershipi shkollor merr rëndësi vendimtare. Drejtuesi dhe nëndrejtori nuk duhet të veprojnë vetëm si administratorë që kërkojnë zbatim urdhrash, por si liderë pedagogjikë që ndihmojnë mësuesit të kalojnë nga pasiguria te përdorimi i qëllimshëm, nga frika te eksperimentimi i sigurt dhe nga puna individuale te bashkëpunimi profesional. Roli i tyre është të krijojnë një mjedis ku gabimi shihet si mundësi të nxëni, ku mësuesit ndihmojnë njëri tjetrin dhe ku teknologjia lidhet me objektiva konkrete mësimore.

Problemi kërkimor i këtij punimi lidhet me pyetjen: Si ndikon lidershipi shkollor, veçanërisht lidershipi transformues dhe pedagogjik i nëndrejtorit, në uljen e rezistencës së mësuesve ndaj përdorimit të teknologjisë digjitale në mësimdhënie?

1.1 Qëllimi i studimit

Qëllimi kryesor i studimit është të analizojë mënyrat se si lidershipi shkollor mund të mbështesë, motivojë dhe orientojë mësuesit në përdorimin e teknologjisë digjitale, duke ulur rezistencën ndaj ndryshimit dhe duke ndërtuar një kulturë bashkëpunuese të inovacionit pedagogjik.

1.2 Objektivat e studimit

1. Të identifikojë arsyet kryesore të rezistencës së mësuesve ndaj teknologjisë digjitale.
2. Të analizojë rolin e drejtuesit dhe nëndrejtorit në krijimin e klimës së besimit dhe mbështetjes.
3. Të shqyrtojë ndikimin e mentorimit dhe bashkëpunimit kolegial në rritjen e kompetencës digjitale.
4. Të ndërtojë një model praktik ndërhyrjeje që mund të zbatohet në shkollë.
5. Të propozojë rekomandime për zhvillimin profesional të mësuesve dhe për menaxhimin e ndryshimit.

1.3 Pyetjet kërkimore

1. Cilat janë shkaqet kryesore që i bëjnë mësuesit të hezitojnë në përdorimin e teknologjisë digjitale?
2. Çfarë lloj mbështetjeje presin mësuesit nga drejtuesit e shkollës?
3. Si ndikon lidershipi transformues në perceptimin e dobisë dhe lehtësisë së përdorimit të teknologjisë?
4. Çfarë roli ka nëndrejtori si lider pedagogjik në koordinimin e trajnimeve, mentorimit dhe reflektimit profesional?
5. Cilat strategji janë më të përshtatshme për të ulur rezistencën dhe për të rritur përdorimin e qëndrueshëm të teknologjisë?

2. Rishikimi i literaturës

Lidershipi transformues lidhet me aftësinë e drejtuesit për të krijuar vizion, për të frymëzuar stafin, për të ndërtuar besim dhe për të nxitur zhvillim profesional. Në literaturën e lidershipit, Bass e përshkruan lidershipin transformues si qasje që shkon përtej shpërblimit dhe kontrollit, duke synuar motivimin e brendshëm dhe përkushtimin ndaj qëllimeve të përbashkëta. Në shkollë, kjo do të thotë se drejtuesi nuk mjaftohet me kërkesën që mësuesit ta përdorin teknologjinë, por i ndihmon ata të kuptojnë pse, si dhe me çfarë përfitimi pedagogjik duhet ta përdorin atë.

Rezistenca ndaj ndryshimit nuk duhet parë thjesht si mungesë dëshire. Ajo shpesh është reagim ndaj pasigurisë, mungesës së kohës, frikës nga vlerësimi, mungesës së përvojës ose përvojave të mëparshme negative. Teoria e përhapjes së inovacioneve e Rogers thekson se adoptimi i një risie kalon nëpër faza si njohja, bindja, vendimi, zbatimi dhe konfirmimi. Kjo tregon se mësuesit nuk mund të kalojnë menjëherë nga mosnjohja te përdorimi i plotë. Ata kanë nevojë për informacion, provë, mbështetje dhe vërtetim të përfitimeve në praktikë.

Modeli i pranimit të teknologjisë, i njohur si TAM, thekson dy faktorë themelorë: dobia e perceptuar dhe lehtësia e perceptuar e përdorimit. Nëse një mësues beson se teknologjia e ndihmon realisht mësimdhënien dhe se mund ta përdorë pa përpjekje të tepërt, gjasat për ta pranuar rriten. Prandaj lidershipi shkollor duhet të punojë pikërisht me këto dy perceptime: të tregojë vlerën pedagogjike dhe të ulë vështirësinë praktike.

Korniza TPACK e Mishra dhe Koehler e vendos teknologjinë në ndërthurje me njohuritë pedagogjike dhe përmbajtjen lëndore. Sipas kësaj qasjeje, mësuesi nuk duhet të përdorë teknologji vetëm për efekt modernizimi, por duhet ta zgjedhë atë në varësi të objektivit mësimor, përmbajtjes dhe metodës pedagogjike. Për shembull, një kuiz digjital ka vlerë kur ndihmon vlerësimin formues dhe reflektimin e nxënësit, jo kur përdoret vetëm sepse është mjet i ri.

Në këtë këndvështrim, roli i nëndrejtorit është i rëndësishëm sepse ai ndodhet pranë procesit mësimor, ndjek planifikimin, vëzhgon orët, organizon punën profesionale dhe mund të krijojë lidhje të drejtpërdrejtë midis objektivave të shkollës dhe nevojave reale të mësuesve. Nëndrejtori mund të shndërrohet në koordinator të ndryshimit digjital, duke kombinuar trajnimin, mentorimin, vëzhgimin miqësor dhe ndarjen e praktikave të mira.

2.1 Kuadri teorik i studimit

Teoria / modeli	Ideja kryesore	Lidhja me teknologjinë	Implikimi për lidershipin
Lidershipi transformues	Vizion, frymëzim, besim dhe zhvillim profesional	Teknologjia pranohet kur lidhet me vizionin e shkollës	Drejtuesi krijon kuptim dhe motivim, jo vetëm kontroll
Përhapja e inovacioneve	Adoptimi kalon në faza dhe kërkon kohë	Mësuesit kanë nevojë për njohje, provë dhe konfirmim	Ndryshimi duhet menaxhuar gradualisht
Modeli TAM	Pranimi varet nga dobia dhe lehtësia e perceptuar	Mësuesi përdor mjetin kur e sheh të dobishëm dhe të thjeshtë	Trajnimi duhet të jetë praktik dhe i lidhur me lëndën
TPACK	Teknologjia bashkohet me pedagogjinë dhe përmbajtjen	Mjeti digjital zgjidhet sipas objektivit mësimor	Lideri orienton përdorimin pedagogjik, jo përdorimin formal

Tabela 1. Kuadri teorik i studimit

3. Baza ligjore dhe institucionale

Baza ligjore e këtij punimi lidhet me kuadrin shqiptar për arsimin parauniversitar, strategjitë kombëtare të arsimit dhe dokumentet europiane mbi edukimin digjital. Ligji nr. 69, datë 21.06.2012, për sistemin arsimor parauniversitar në Republikën e Shqipërisë, i ndryshuar, përcakton parimet, strukturën, veprimtarinë dhe qeverisjen e sistemit arsimor parauniversitar. Ky ligj është themelor sepse vendos përgjegjësinë institucionale për cilësinë e arsimit dhe për organizimin e punës në shkollë.

Strategjia Kombëtare e Arsimit 2021 deri 2026, e miratuar me Vendimin e Këshillit të Ministrave nr. 621, datë 22.10.2021, përcakton drejtimet strategjike për zhvillimin e arsimit në Shqipëri. Në këtë kuadër, digjitalizimi, zhvillimi profesional i mësuesve, menaxhimi i cilësisë dhe përmirësimi i rezultateve të të nxënit janë të lidhura ngushtë me rolin e institucioneve arsimore dhe me kapacitetin e drejtuesve për të zbatuar ndryshimin.

Rregullorja për funksionimin e institucioneve arsimore parauniversitare, miratuar me Urdhrin nr. 31, datë 28.01.2020, përcakton rregulla organizative për punën e shkollës, bashkëpunimin profesional dhe funksionimin e strukturave të brendshme. Për këtë studim, ky dokument është i rëndësishëm sepse teknologjia digjitale nuk trajtohet vetëm si çështje mjetesh, por si pjesë e organizimit të punës pedagogjike, komunikimit dhe zhvillimit profesional.

Në nivel europian, Plani i Veprimit për Edukimin Digjital 2021 deri 2027 i Komisionit Europian vendos si prioritet krijimin e një ekosistemi digjital arsimor me performancë të lartë dhe forcimin e aftësive digjitale për transformimin digjital. Kjo qasje përputhet me idenë se shkolla duhet të ndërtojë jo vetëm infrastrukturë, por edhe kapacitete njerëzore, kompetenca, etikë dhe përdorim kritik të teknologjisë.

ASCAP ka publikuar materiale për kompetencën digjitale të mësuesve në arsimin parauniversitar, duke e trajtuar atë si tërësi njohurish, shkathtësish, qëndrimesh dhe vlerash që mësuesi duhet t'i zbatojë në mënyrë të sigurt, kritike, etike dhe përgjegjëse nëpërmjet teknologjive digjitale. Kjo e vendos kompetencën digjitale në qendër të zhvillimit profesional dhe të cilësisë së mësimdhënies.

3.1 Tabela përmbledhëse e bazës ligjore

Dokumenti	Institucioni	Lidhja me temën	Përdorimi në punim
Ligji nr. 69, datë 21.06.2012, i ndryshuar	Kuvendi i Shqipërisë	Qeverisja dhe cilësia e arsimit parauniversitar	Mbështet analizën e rolit drejtues të shkollës
Strategjia Kombëtare e Arsimit 2021 deri 2026	Këshilli i Ministrave	Zhvillimi i arsimit, cilësia, profesionalizimi dhe digjitalizimi	Vendos temën në prioritetet strategjike kombëtare
Rregullorja e funksio-nimit të institucioneve arsimore parauniversitare	Ministria përgjegjëse për arsimin	Organizimi i punës pedagogjike dhe bashkëpunimi profesional	Lidh ndryshimin digjital me organizimin e shkollës
Plani Europian për Edukimin Digjital 2021 deri 2027	Komisioni Europian	Ekosistem digjital arsimor dhe aftësi digjitale	Jep orientim krahasues europian
Metodologjia e ASCAP për kompetencat digjitale të mësuesve	ASCAP	Kompetenca digjitale si pjesë e profesionit të mësuesit	Ndihmon në ndërtimin e instrumenteve të vlerësimit

Tabela 2. Baza ligjore dhe institucionale e studimit

4. Metodologjia

Studimi propozon një qasje cilësore, sepse synon të kuptojë përvojat, perceptimet, frikërat, pritshmëritë dhe interpretimet e mësuesve lidhur me përdorimin e teknologjisë digjitale. Qasja cilësore është e përshtatshme kur studiuesi kërkon të analizojë kuptimet që pjesëmarrësit i japin një fenomeni dhe jo thjesht të masë frekuenca numerike.

Metoda kryesore e mbledhjes së të dhënave është intervista gjysmë e strukturuar me stafin pedagogjik. Kjo metodë lejon përdorimin e pyetjeve orientuese, por njëkohësisht i jep hapësirë pjesëmarrësit të shpjegojë përvoja konkrete, shqetësime dhe sugjerime. Për të rritur besueshmërinë e analizës, intervistat mund të plotësohen me vëzhgim të orëve mësimore, analizë dokumentesh shkollore dhe diskutime në grup profesional.

Kampioni i propozuar përfshin 20 mësues të niveleve të ndryshme lëndore dhe 3 drejtues ose nëndrejtorë. Përzgjedhja bëhet në mënyrë të qëllimshme, në mënyrë që të përfshihen mësues me përvojë të ndryshme profesionale, me nivele të ndryshme të kompetencës digjitale dhe me qëndrime të ndryshme ndaj teknologjisë. Kjo ndihmon në krijimin e një pamjeje më të plotë të fenomenit.

Analiza e të dhënave kryhet nëpërmjet kodimit tematik. Fillimisht transkriptohen intervistat, më pas identifikohen shprehjet kryesore, grupohen kodet dhe ndërtohen temat kryesore. Temat e pritshme përfshijnë: frikën nga gabimi, mungesën e trajnimit praktik, mungesën e kohës, mbështetjen nga kolegët, ndikimin e drejtuesit, perceptimin e dobisë dhe ndryshimin gradual të praktikave mësimore.

4.1 Dizajni metodologjik

Elementi	Përshkrimi	Arsyeja metodologjike
Lloji i studimit	Studim cilësor me elemente përshkruese	Lejon analizën e përvojave dhe kuptimeve të mësuesve
Instrumenti kryesor	Intervistë gjysmë e strukturuar	Krijon balancë midis pyetjeve të planifikuara dhe përgjigjeve të lira
Pjesëmarrësit	20 mësues dhe 3 drejtues ose nëndrejtorë	Siguron këndvështrime të ndryshme mbi të njëjtin fenomen
Analiza	Kodim tematik	Identifikon modelet kryesore të rezistencës dhe mbështetjes
Etika	Anonimitet, pëlqim i informuar, përdorim vetëm akademik	Mbron pjesëmarrësit dhe rrit besueshmërinë e studimit

Tabela 3. Dizajni metodologjik i studimit

5. Analiza dhe diskutimi

Të dhënat e mëposhtme janë të dhëna ilustruese për të treguar mënyrën se si mund të paraqiten gjetjet pas realizimit të intervistave reale. Ato nuk duhet të raportohen si rezultate faktike pa u kryer më parë mbledhja e të dhënave në terren. Megjithatë, modeli i paraqitur është i dobishëm sepse tregon strukturën e analizës, llojin e grafikëve dhe lidhjen midis gjetjeve dhe rekomandimeve.

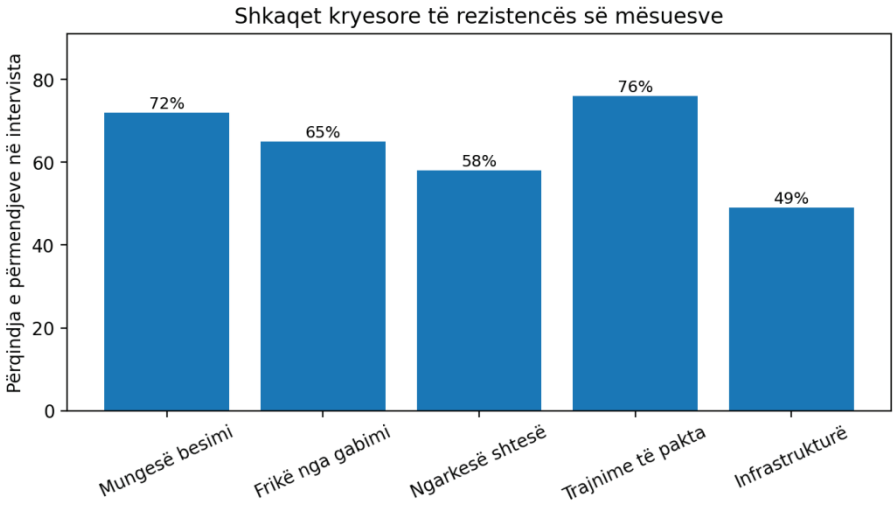

Figura 1. Shkaqet kryesore të rezistencës së mësuesve

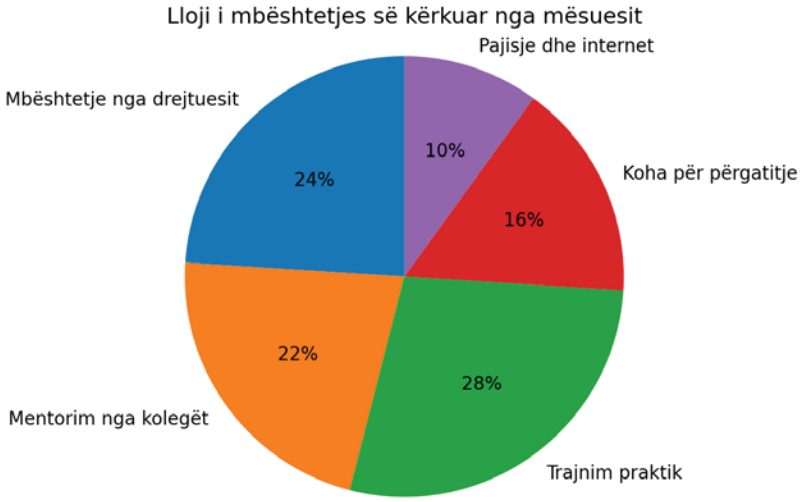

Figura 2. Mbështetja e kërkuar nga mësuesit

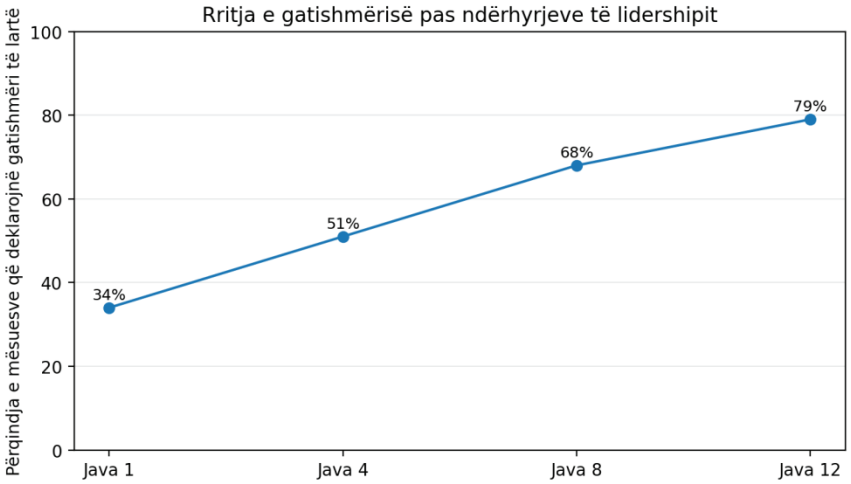

Figura 3. Rritja e gatishmërisë pas ndërhyrjeve të lidershipit

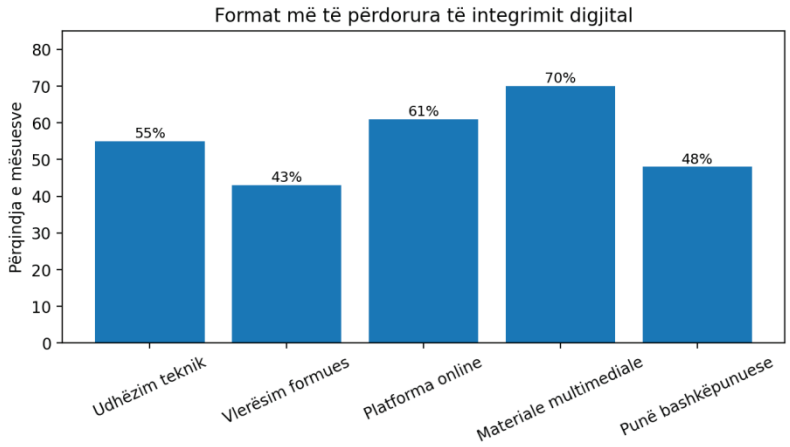

Figura 4. Format e përdorimit të teknologjisë në mësimdhënie

Figura 1 tregon se mungesa e trajnimeve praktike dhe mungesa e besimit në aftësitë personale dalin si faktorë të fortë të rezistencës. Kjo nënkupton se zgjidhja nuk është vetëm blerja e pajisjeve, por krijimi i një sistemi mbështetës ku mësuesi mëson duke provuar, duke gabuar në mënyrë të sigurt dhe duke marrë ndihmë nga kolegët ose drejtuesi.

Figura 2 sugjeron se mësuesit kërkojnë më shumë trajnime praktike, mentorim dhe mbështetje të drejtpërdrejtë nga drejtuesit. Kjo është në përputhje me qasjen transformuese të lidershipit, sipas së cilës drejtuesi ndërton kapacitete dhe nuk kufizohet te kontrolli formal i zbatimit.

Figura 3 paraqet një model të mundshëm të rritjes së gatishmërisë pas ndërhyrjeve të lidershipit gjatë një periudhe 12 javore. Rritja graduale tregon se ndryshimi kërkon kohë dhe se mësuesit mund të kalojnë nga hezitimi te përdorimi i qëndrueshëm kur marrin mbështetje të vazhdueshme.

Figura 4 tregon se përdorimi më i shpeshtë i teknologjisë lidhet me materiale multimediale dhe platforma online, ndërsa vlerësimi formues digjital mund të jetë më pak i zhvilluar. Kjo sugjeron nevojën për trajnime që nuk fokusohen vetëm në përdorimin teknik të mjeteve, por edhe në vlerën pedagogjike të tyre.

5.1 Temat kryesore nga intervistat

Tema	Shembull deklarate nga mësuesit	Interpretim	Ndërhyrja e drejtuesit
Pasiguri profesionale	Kam frikë se mos gaboj para nxënësve	Frika lidhet me vetëbesimin dhe jo me kundërshtim real	Vëzhgim miqësor, mentorim dhe provë pa penalizim
Ngarkesë shtesë	Teknologjia më merr shumë kohë në përgatitje	Mësuesi e sheh teknologjinë si barrë, jo si ndihmë	Modele të gatshme, planifikim i përbashkët dhe ndarje materialesh
Mungesë trajnimi praktik	Trajnimet janë teorike dhe nuk lidhen me orën time	Trajnimi formal nuk mjafton për ndryshim praktik	Trajnime të shkurtra sipas lëndëve dhe demonstrime në klasë
Mbështetje kolegiale	Më ndihmon më shumë një koleg që e ka provuar vetë	Besimi rritet kur ndihma vjen nga përvoja konkrete	Krijim i grupeve të mentorimit brenda shkollës
Roli i drejtuesit	Kur drejtuesi na mbështet, kemi më pak frikë të provojmë	Klima e shkollës ndikon në gatishmërinë për ndryshim	Komunikim i hapur, vlerësim pozitiv dhe vizion i qartë

Tabela 4. Analiza tematike e intervistave

Nga analiza tematike del se rezistenca ndaj teknologjisë nuk është një fenomen i vetëm. Ajo përbëhet nga elemente psikologjike, profesionale, organizative dhe teknike. Për këtë arsye, ndërhyrja e lidershipit duhet të jetë shumëdimensionale. Një trajnim i vetëm nuk mjafton, nëse nuk shoqërohet me kohë për praktikë, ndihmë të personalizuar, modele konkrete dhe vlerësim pozitiv.

Nëndrejtori si lider pedagogjik mund të luajë rol kyç në këtë proces. Ai mund të identifikojë mësuesit që kanë kompetenca më të larta digjitale dhe t'i përfshijë si mentorë. Gjithashtu mund të planifikojë orë të hapura, mini trajnime javore, banka materialesh digjitale dhe takime reflektimi ku mësuesit ndajnë vështirësitë pa u ndjerë të gjykuar.

Një aspekt i rëndësishëm është edhe gjuha e komunikimit. Nëse teknologjia paraqitet si detyrim, rezistenca rritet. Nëse paraqitet si mundësi për ta bërë mësimin më të qartë, më tërheqës dhe më të matshëm, mësuesit kanë më shumë gjasa ta pranojnë. Prandaj drejtuesi duhet të lidhë çdo mjet digjital me një problem real pedagogjik: si të aktivizohen nxënësit, si të merret reagim i shpejtë, si të personalizohet të nxënit, si të dokumentohet progresi dhe si të rritet bashkëpunimi.

6. Model praktik ndërhyrjeje për shkollën

Modeli i propozuar quhet cikli VMBR: Vizion, Mbështetje, Bashkëpunim, Reflektim. Ai mund të zbatohet nga drejtori dhe nëndrejtori gjatë një periudhe 12 javore për të ulur rezistencën dhe për të rritur përdorimin pedagogjik të teknologjisë digjitale.

Faza	Kohëzgjatja	Veprimet kryesore	Roli i nëndrejtorit	Tregues suksesi
Vizion	Java 1 deri 2	Takim me stafin, identifikim i nevojave, përcaktim i qëllimeve pedagogjike	Shpjegon pse teknologjia lidhet me cilësinë e të nxënit	Stafi kupton qëllimin dhe jep sugjerime
Mbështetje	Java 3 deri 5	Mini trajnime praktike, demonstrime në klasë, materiale të gatshme	Organizon trajnime sipas lëndëve dhe ndihmë individuale	Mësuesit provojnë së paku një mjet digjital
Bashkëpunim	Java 6 deri 9	Çifte mentorimi, orë të hapura, bankë materialesh	Lidh mësuesit me mentorë dhe ndjek progresin	Rritet ndarja e praktikave mes kolegëve
Reflektim	Java 10 deri 12	Diskutim mbi rezultatet, vështirësitë dhe përmirësimet	Mbledh reagime dhe planifikon hapat vijues	Teknologjia përdoret më qëllimshëm dhe më shpesh

Tabela 5. Modeli VMBR për menaxhimin e ndryshimit digjital

Ky model duhet të zbatohet me kujdes, duke shmangur mbingarkesën e mësuesve. Qëllimi nuk është që çdo orë mësimore të jetë digjitale, por që teknologjia të përdoret aty ku shton vlerë. Një mësues mund të fillojë me një kuiz të thjeshtë digjital, një prezantim interaktiv, një video shpjeguese, një ushtrim në platformë ose një mënyrë të re për të mbledhur reagimet e nxënësve. Rëndësi ka që përvoja fillestare të jetë pozitive, e realizueshme dhe e lidhur me lëndën

6.1 Ilustrime praktike të përdorimit pedagogjik të teknologjisë

Situata mësimore	Mjeti digjital i mundshëm	Qëllimi pedagogjik	Roli i drejtuesit
Kontroll i shpejtë i të kuptuarit	Kuiz online ose formular digjital	Vlerësim formues dhe reagim i menjëhershëm	Siguron shembuj pyetjesh dhe ndan modele
Shpjegim i koncepteve të vështira	Video e shkurtër, simulim, prezantim interaktiv	Vizualizim dhe konkretizim	Nxit përdorimin e burimeve të verifikuara
Punë në grup	Dokument i përbashkët online	Bashkëpunim dhe përgjegjësi e përbashkët	Krijon rregulla për etikën dhe sigurinë digjitale
Detyra individuale	Platformë mësimore ose portofol digjital	Personalizim dhe ndjekje progresi	Organizon ndihmë për mësuesit që kanë vështirësi
Reflektim i nxënësve	Pyetje daljeje në formë digjitale	Vetëvlerësim dhe përmirësim i orës tjetër	Analizon të dhënat me mësuesit në takim profesional

Tabela 6. Shembuj të integrimit pedagogjik të teknologjisë

7. Përfundime dhe rekomandime

Ky punim arrin në përfundimin se lidershipi shkollor është faktor vendimtar në kapërcimin e rezistencës së mësuesve ndaj përdorimit të teknologjisë digjitale. Rezistenca nuk duhet interpretuar si mungesë profesionalizmi, por si sinjal se mësuesit kanë nevojë për mbështetje, qartësi, kohë, besim dhe zhvillim profesional të lidhur me praktikën e tyre të përditshme.

Lidershipi transformues është veçanërisht i përshtatshëm për këtë proces sepse ai ndërton vizion të përbashkët, rrit motivimin, fuqizon stafin dhe krijon kulturë bashkëpunimi. Një drejtues që imponon teknologjinë mund të arrijë zbatim formal, por jo përdorim cilësor. Një drejtues që udhëheq me shembull, komunikim dhe mbështetje krijon kushte për ndryshim të qëndrueshëm.

Roli i nëndrejtorit si lider pedagogjik del si element kyç. Nëndrejtori mund të jetë ura midis strategjisë së shkollës dhe praktikës së klasës. Ai mund të identifikojë nevojat reale, të organizojë mentorimin, të vëzhgojë orët në mënyrë mbështetëse, të nxisë bashkëpunimin dhe të ndihmojë mësuesit të zgjedhin teknologjinë sipas objektivit mësimor.

Suksesi i digjitalizimit nuk matet me numrin e pajisjeve, por me cilësinë e përdorimit të tyre në funksion të të nxënit. Teknologjia ka vlerë kur e bën mësimin më të qartë, më ndërveprues, më të personalizuar dhe më të matshëm. Për këtë arsye, çdo ndërhyrje duhet të nisë nga pedagogjia dhe jo nga mjeti.

7.1 Rekomandime

Drejtuesit e shkollave të hartojnë një plan të qartë për integrimin digjital, të lidhur me objektivat mësimore dhe jo vetëm me përdorimin teknik të pajisjeve.

Të organizohen trajnime të shkurtra, praktike dhe të përsëritura, të ndara sipas nevojave të mësuesve dhe lëndëve.

Të krijohen çifte mentorimi ku mësuesit me aftësi më të mira digjitale ndihmojnë kolegët në planifikim dhe zbatim.

Të zhvillohen orë të hapura dhe demonstrime ku teknologjia përdoret për zgjidhjen e problemeve konkrete pedagogjike.

Të përdoret vëzhgimi miqësor dhe reflektimi profesional, jo kontrolli ndëshkues.

Të krijohet bankë materialesh digjitale në nivel shkolle, e organizuar sipas lëndëve dhe klasave.

Të matet progresi përmes treguesve të thjeshtë, si numri i mësuesve që provojnë mjete të reja, cilësia e planifikimit dhe reagimi i nxënësve.

Të respektohen parimet e sigurisë, etikës dhe përdorimit të përgjegjshëm të teknologjisë.

Artificial Intelligence as a partner in Foreign Language Acquisition: Opportunities, Challenges, and the evolving role of the contemporary teacher

Jorina Mema

Local Office of Pre-University Education Kamëz

Abstract

This paper explores the transformative role of Artificial Intelligence (AI) in foreign language acquisition, examining its potential as a strategic catalyst within the instructional process. In the contemporary era, technology has become deeply embedded in students' daily lives, fundamentally reshaping their approach to linguistic development. Consequently, AI should not be perceived as a substitute for the educator; rather, it serves as a sophisticated tool that makes learning more engaging, practical, and meticulously tailored to the idiosyncratic needs of the individual learner.

The primary objective of this study is to analyze the diverse opportunities AI offers for honing core linguistic competencies: speaking, listening, reading, and writing. Through the integration of digital tools, students are empowered to refine their pronunciation, expand their lexical range, generate authentic dialogues, and receive immediate corrective feedback. This interactive feedback loop fosters greater learner autonomy and bolsters self-efficacy, encouraging students to become more proactive participants in their communicative journey.

Furthermore, the paper critically examines the inherent challenges associated with AI integration. Notable among these are an over-reliance on automated translation, the risks of academic dishonesty, the potential erosion of critical thinking, and the hazards of undirected technological usage. Addressing these concerns necessitates the enduring presence of the teacher, whose role is vital in guiding students toward the ethical, secure, and pedagogically sound application of AI resources.

A central premise of this study is the redefined role of the contemporary educator—transitioning from a traditional transmitter of knowledge to a facilitator, strategist, and mentor within the digital landscape. The teacher is essential in curating appropriate technological tools, verifying the accuracy of information, and nurturing students' authentic communicative abilities.

In conclusion, this paper asserts that Artificial Intelligence can serve as a highly effective partner in foreign language education when utilized with pedagogical intentionality and foresight. While AI holds the potential to elevate instructional quality and student engagement, its ultimate success is predicated upon the active involvement of the teacher, who remains the indispensable architect of the learning process.

Keywords: artificial intelligence, foreign languages, pedagogy, technology, learners, contemporary teacher, linguistic competencies, communication.

1. Hyrje

Mësimi i gjuhëve të huaja është një nga fushat arsimore ku ndikimi i teknologjisë ndihet më drejtpërdrejt dhe më shpejt. Gjuha, si mjet komunikimi, është e lidhur ngushtë me jetën e përditshme, me kulturën, me informacionin dhe me mënyrat e reja të ndërveprimit shoqëror. Në ditët e sotme, nxënësit nuk e takojnë gjuhën e huaj vetëm në tekstin shkollor apo në orën e mësimit, por edhe në rrjete sociale, në platforma video, në lojëra elektronike, në këngë, filma, aplikacione, faqe interneti dhe në komunikimin e përditshëm digjital. Ata dëgjojnë, lexojnë dhe përdorin fjalë apo shprehje të huaja shumë më shpesh se më parë, shpesh edhe pa e kuptuar se janë duke zhvilluar një formë të të nxënit informal.

Ky realitet i ri e ka ndryshuar ndjeshëm mënyrën se si perceptohet klasa e gjuhës së huaj. Ajo nuk mund të mbetet më një hapësirë e kufizuar vetëm në shpjegimin e rregullave gramatikore, përkthimin e teksteve apo riprodhimin mekanik të ushtrimeve. Përkundrazi, klasa bashkëkohore e gjuhës së huaj duhet të jetë më e hapur, më dinamike, më ndërvepruese dhe më e lidhur me përvojat reale të nxënësve. Teknologjia ka krijuar mundësi që nxënësi të mos jetë vetëm marrës pasiv i informacionit, por pjesëmarrës aktiv në procesin e të nxënit. Ai mund të kërkojë, të krahasojë, të dëgjojë modele shqiptimi, të komunikojë, të krijojë tekste dhe të praktikojë gjuhën në mënyra të ndryshme.

Në këtë kontekst, inteligjenca artificiale përfaqëson një zhvillim të rëndësishëm në fushën e arsimit dhe veçanërisht në mësimin e gjuhëve të huaja. Mjetet e inteligjencës artificiale, sidomos ato gjenerative, kanë aftësinë të prodhojnë tekst, zë, imazh, dialog, përmbledhje, ushtrime, pyetje dhe përgjigje të përshtatura sipas kërkesës së përdoruesit. Kjo e bën inteligjencën artificiale një mjet me potencial të madh për personalizimin e të nxënit, sepse ajo mund të përshtatet me nivelin, ritmin, interesat dhe nevojat e nxënësit. Për shembull, një nxënës që ka vështirësi në të folur mund të praktikojë dialogë të thjeshtë me një bashkëbisedues virtual; një nxënës tjetër që ka nevojë të pasurojë fjalorin mund të marrë shembuj konkretë në fjali; ndërsa një nxënës që gabon shpesh në strukturat gramatikore mund të marrë shpjegime dhe ushtrime shtesë.

Një nga përparësitë më të dukshme të inteligjencës artificiale në mësimin e gjuhëve të huaja është feedbacku i menjëhershëm. Në një klasë me shumë nxënës, mësuesi mund të mos ketë gjithmonë mundësi t'i korrigjojë të gjithë në të njëjtën kohë ose t'i japë secilit shpjegim të personalizuar. Ndërsa një mjet digjital i bazuar në inteligjencë artificiale mund t'i ndihmojë nxënësit të kuptojnë gabimet e tyre, të riformulojnë fjali, të krahasojnë variante të ndryshme shprehjeje dhe të ushtrohen në mënyrë të pavarur. Kjo nuk e zëvendëson korrigjimin profesional të mësuesit, por mund ta plotësojë atë duke i dhënë nxënësit më shumë mundësi për praktikë.

Një rëndësi të veçantë ka edhe ndikimi i inteligjencës artificiale në rritjen e vetëbesimit të nxënësve. Në mësimin e gjuhëve të huaja, shumë nxënës ndihen të pasigurt kur duhet të flasin para klasës, sepse kanë frikë nga gabimet, nga shqiptimi jo i saktë ose nga reagimi i shokëve. Në këto raste, një bashkëbisedues virtual mund të shërbejë si hap paraprak për ushtrim. Nxënësi mund të praktikojë pa presion, të përsërisë disa herë, të korrigjojë përgjigjet dhe më pas të ndihet më i gatshëm për të marrë pjesë në komunikim real në klasë. Kjo e bën teknologjinë një mbështetje të vlefshme për gjithëpërfshirjen, sidomos për nxënësit më të ndrojtur ose për ata që kanë nevojë për më shumë kohë për të ndërtuar përgjigjet e tyre.

Megjithatë, përdorimi i inteligjencës artificiale nuk është automatikisht cilësor dhe nuk garanton vetvetiu përmirësim të të nxënit. Çdo mjet teknologjik varet nga mënyra se si përdoret, nga qëllimi pedagogjik që i jepet dhe nga aftësia e nxënësit për ta vlerësuar informacionin në mënyrë kritike. Një përgjigje e prodhuar nga një sistem digjital mund të jetë e pasaktë, e përgjithshme, e njëanshme, e papërshtatshme për moshën ose nivelin gjuhësor të nxënësit. Përveç kësaj, nxënësit mund të krijojnë varësi nga përkthimi automatik, të dorëzojnë detyra të prodhuara plotësisht nga teknologjia ose të shmangin përpjekjen personale për të menduar, shkruar dhe komunikuar në gjuhën e huaj.

Për këtë arsye, pyetja kryesore e këtij punimi nuk është thjesht nëse inteligjenca artificiale duhet të përdoret në mësimin e gjuhëve të huaja, por si duhet të përdoret ajo në mënyrë pedagogjike, etike, të sigurt dhe të dobishme. Përdorimi i saj kërkon planifikim të kujdesshëm, rregulla të qarta dhe udhëzim të vazhdueshëm nga mësuesi. Nxënësit duhet të mësojnë jo vetëm si të marrin përgjigje nga inteligjenca artificiale, por edhe si të bëjnë pyetje të mira, si të kontrollojnë saktësinë e përgjigjeve, si të dallojnë gabimet, si të shmangin kopjimin dhe si ta përdorin teknologjinë për të zhvilluar mendimin e tyre.

Roli i mësuesit mbetet qendror dhe i pazëvendësueshëm. Mësuesi nuk është thjesht përdorues i teknologjisë, por organizues i procesit mësimor, udhëzues i nxënësve dhe garantues i cilësisë pedagogjike. Ai përcakton objektivat e orës së mësimit, zgjedh mjetet e përshtatshme, ndërton detyrat, orienton përdorimin e inteligjencës artificiale, kontrollon rezultatet dhe nxit reflektimin. Mësuesi është ai që e kthen një mjet teknologjik nga burim informacioni në mjet të vërtetë mësimor.

Inteligjenca artificiale është e dobishme kur e forcon rolin e mësuesit dhe e bën procesin mësimor më të pasur, më të larmishëm dhe më të përshtatur me nxënësin. Ajo bëhet problematike kur përdoret pa qëllim, pa kontroll dhe pa ndërgjegjësim. Prandaj, sfida kryesore e arsimit bashkëkohor nuk është të zgjedhë midis mësuesit dhe teknologjisë, por të ndërtojë një bashkëpunim të mençur midis tyre. Në këtë bashkëpunim, inteligjenca artificiale mund të jetë partner mbështetës, ndërsa mësuesi mbetet figura kryesore që i jep kuptim, drejtim dhe vlerë njerëzore procesit të të nxënit.

Pyetjet kërkimore

Nr.	Pyetja kërkimore	Qëllimi didaktik
1	Si mund të ndihmojë inteligjenca artificiale në zhvillimin e aftësive gjuhësore?	Të identifikohen mundësitë për të folur, dëgjuar, lexuar dhe shkruar.
2	Cilat janë rreziqet kryesore të përdorimit të saj në mësim?	Të dallohen rreziqet etike, pedagogjike dhe teknologjike.
3	Çfarë roli duhet të ketë mësuesi bashkëkohor?	Të përcaktohet roli i mësuesit si udhëzues, kontrollues dhe mbështetës.
4	Si mund të ndërtohet një model praktik për orën e gjuhës së huaj?	Të jepen shembuj konkretë, tabela pune dhe rubrika vlerësimi.

Tabela 1. Pyetjet kërkimore të punimit

2. Rishikimi i literaturës

Literatura bashkëkohore e sheh inteligjencën artificiale si një teknologji që mund të mbështesë personalizimin, ndërveprimin dhe vlerësimin formues. Në mësimin e gjuhëve të huaja, kjo lidhet me nevojën për praktikë të shpeshtë, feedback të menjëhershëm dhe ekspozim ndaj kontekseteve të ndryshme komunikimi. Raporti i British Council për inteligjencën artificiale në mësimdhënien e anglishtes thekson se përdorimi i saj duhet të shoqërohet me kujdes pedagogjik, me zhvillim profesional të mësuesve dhe me politika të qarta institucionale.

UNESCO e trajton inteligjencën artificiale gjenerative në arsim si një fushë që kërkon qasje me njeriun në qendër. Sipas kësaj qasjeje, teknologjia duhet të forcojë të drejtat, sigurinë, gjithëpërfshirjen dhe cilësinë e të nxënit, pa zëvendësuar marrëdhënien pedagogjike mes mësuesit dhe nxënësit.

Korniza e Përbashkët Evropiane e Referencës për Gjuhët e sheh nxënësin si përdorues social të gjuhës. Kjo do të thotë se gjuha nuk mësohet vetëm si sistem rregullash, por si mjet për veprim, bashkëpunim, ndërveprim dhe ndërmjetësim. Në këtë pikë, inteligjenca artificiale mund të ndihmojë në krijimin e situatave komunikative, por kuptimi real i komunikimit mbetet njerëzor dhe kulturor.

Në literaturë theksohet edhe rreziku i mbështetjes së tepruar te automatizimi. Nxënësi që përdor gjithmonë përkthim automatik mund të fitojë produkt të saktë në dukje, por të mos

zhvillojë mjaftueshëm kompetencën e brendshme gjuhësore. Prandaj, përdorimi i inteligjencës artificiale duhet të jetë i planifikuar, i dokumentuar dhe i lidhur me reflektim.

Tabela analitike e literaturës

Burimi	Ide kryesore	Lidhja me gjuhët e huaja	Përdorim në punim
UNESCO, 2023	Qasje me njeriun në qendër, politika, etikë, siguri	Mbron nxënësin dhe orienton përdorimin e përgjegjshëm	Përdoret për bazën etike dhe rekomandimet
British Council, 2024	IA në mësimdhënien e anglishtes kërkon përgatitje dhe gjykim profesional	Lidhet drejtpërdrejt me praktikën e gjuhës në klasë	Përdoret për mundësitë dhe sfidat didaktike
Këshilli i Evropës, CEFR 2020	Nxënësi si përdorues social i gjuhës, ndërveprim dhe ndërmjetësim	Vendos aftësitë komunikuese në qendër	Përdoret për strukturimin e aftësive gjuhësore
OECD, PISA 2022	Teknologjia dhe klima shkollore ndikojnë në të nxënit	Tregon nevojën për udhëzim, përqendrim dhe mbështetje	Përdoret për argumentin se mësuesi mbetet kyç

Tabela 2. Burime kryesore teorike dhe institucionale

3. Baza ligjore dhe institucionale

Përdorimi i inteligjencës artificiale në mjedisin shkollor nuk mund të shihet vetëm si çështje teknike. Ai lidhet me të drejtën për arsim, mbrojtjen e fëmijës, barazinë në akses, sigurinë e të dhënave, integritetin akademik dhe përgjegjësinë profesionale të mësuesit.

Në Shqipëri, Ligji nr. 69/2012 për sistemin arsimor parauniversitar përcakton parimet bazë të organizimit, funksionimit dhe qeverisjes së arsimit parauniversitar. Ky ligj garanton të drejtën për arsim dhe vendos kuadrin mbi të cilin zhvillohet procesi mësimor. Në kontekstin e inteligjencës artificiale, kjo do të thotë se çdo mjet digjital duhet t'i shërbejë qëllimit arsimor, gjithëpërfshirjes dhe cilësisë së të nxënit.

Strategjia Kombëtare e Arsimit 2021 deri 2026 dhe nismat për digjitalizimin e sistemit arsimor theksojnë nevojën për zhvillimin e kompetencës digjitale, përdorimin e teknologjisë në mësim dhe rritjen e aksesit në burime digjitale. Kjo e bën inteligjencën artificiale një temë që duhet trajtuar jo si risi e veçuar, por si pjesë e transformimit digjital të arsimit.

Në nivel evropian, Akti i Inteligjencës Artificiale i Bashkimit Evropian vendos rregulla të bazuara në rrezik dhe synon zhvillimin e sistemeve të besueshme të inteligjencës artificiale. Për arsimin, rëndësi kanë veçanërisht çështjet e transparencës, mbikëqyrjes njerëzore dhe shmangies së praktikave që mund të dëmtojnë të drejtat e nxënësve.

Dokumenti	Fusha që mbulon	Lidhja me IA në arsim	Kujdes për shkollën
Ligji nr. 69/2012	Arsimi parauniversitar në Shqipëri	Teknologjia duhet t'i shërbejë qëllimit arsimor dhe cilësisë	Mësuesi dhe institucioni mbajnë përgjegjësi pedagogjike
Strategjia Kombëtare e Arsimit 2021 deri 2026	Cilësi, digjitalizim, kompetenca	Mbështet përdorimin e TIK dhe kompetencës digjitale	Kërkon trajnim dhe infrastrukturë
Ligji për mbrojtjen e të dhënave personale	Privatësia dhe përpunimi i të dhënave	Nxënësit nuk duhet të ekspozohen në platforma pa kujdes	Të shmanget futja e të dhënave personale në mjete të hapura
Akti i IA i BE, 2024	Rregullim sipas rrezikut	Arsimi trajtohet me kujdes të lartë kur IA ndikon në të drejta dhe mundësi	Të sigurohet transparencë dhe mbikëqyrje njerëzore
UNESCO, 2023	Udhëzime për IA gjenerative në arsim	Vendos etikën, sigurinë dhe njeriun në qendër	Politika shkollore të qarta për përdorimin e IA

Tabela 3. Baza ligjore dhe institucionale për përdorimin e inteligjencës artificiale në arsim

4. Metodologjia

Ky punim është konceptuar si studim përshkrues dhe analitik. Ai ndërthur rishikimin e literaturës, analizën e dokumenteve ligjore dhe institucionale, interpretimin e të dhënave ndërkombëtare dhe ndërtimin e modeleve praktike për mësimdhënien e gjuhëve të huaja.

Metoda përshkruese përdoret për të paraqitur mundësitë dhe sfidat e inteligjencës artificiale në klasë. Metoda analitike përdoret për të krahasuar këto mundësi me objektivat e mësimit të gjuhëve të huaja dhe me rolin e mësuesit. Analiza dokumentare përdoret për të lidhur temën me bazën ligjore dhe me politikat arsimore.

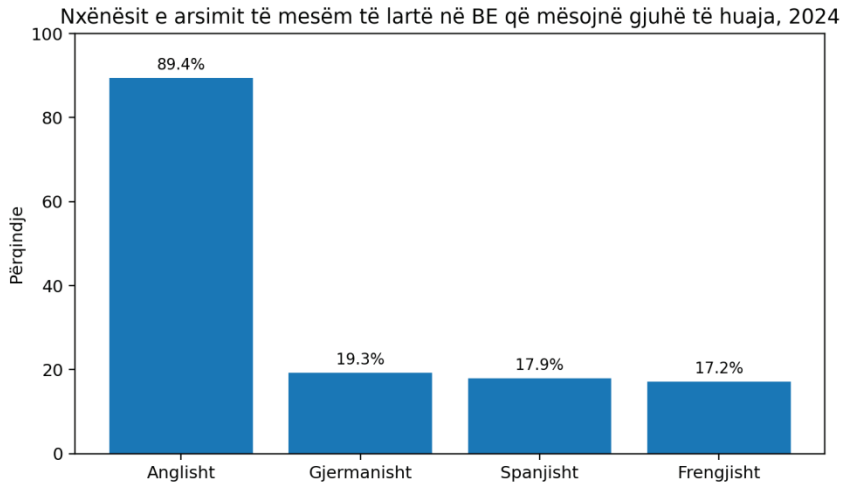
Për një studim më të thelluar empirik, punimi propozon edhe një instrument të thjeshtë pyetësori për nxënës dhe mësues, i cili mund të përdoret në shkollë për të matur përdorimin, qëndrimet dhe nevojat për trajnim.

Instrumenti	Pjesëmarrësit	Çfarë mat?	Shembull pyetjeje
Pyetësor për nxënës	Nxënës të arsimit të mesëm të lartë	Përdorimin e mjeteve të IA dhe qëndrimet ndaj tyre	Sa shpesh përdor IA për detyra në gjuhë të huaj?
Intervistë me mësues	Mësues të gjuhëve të huaja	Përvojën pedagogjike dhe nevojat për trajnim	Cilat detyra janë më të përshtatshme për përdorimin e IA?
Vëzhgim i orës mësimore	Klasë reale	Ndërveprimin, përqendrimin dhe angazhimin	A e përdorin nxënësit IA për mendim apo për kopjim?
Analizë dokumentare	Ligje, strategji, udhëzime	Kuadrin ligjor dhe etik	Çfarë kërkohet për privatësinë dhe mbikëqyrjen njerëzore?

Tabela 4. Metodologjia e propozuar e studimit

5. Të dhëna dhe grafikë krahasues

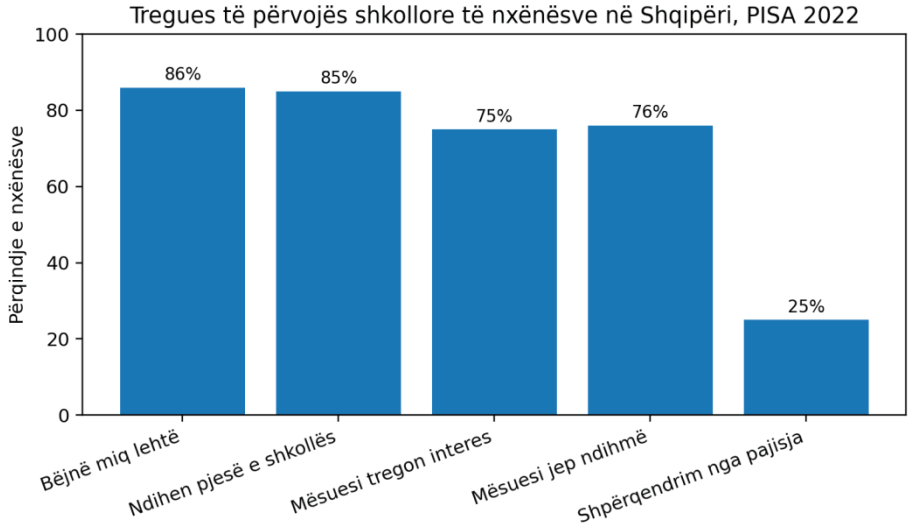
Të dhënat e mëposhtme nuk paraqiten si matje të realizuara në një shkollë të vetme, por si tregues ndërkombëtarë dhe kombëtarë që ndihmojnë në argumentimin e temës. Ato tregojnë rëndësinë e gjuhëve të huaja, nevojën për kompetenca digjitale dhe domosdoshmërinë e menaxhimit pedagogjik të teknologjisë.



Grafiku 1. Nxënësit e arsimit të mesëm të lartë në BE që mësojnë gjuhë të huaja, 2024.

Burimi: Eurostat, 2024.

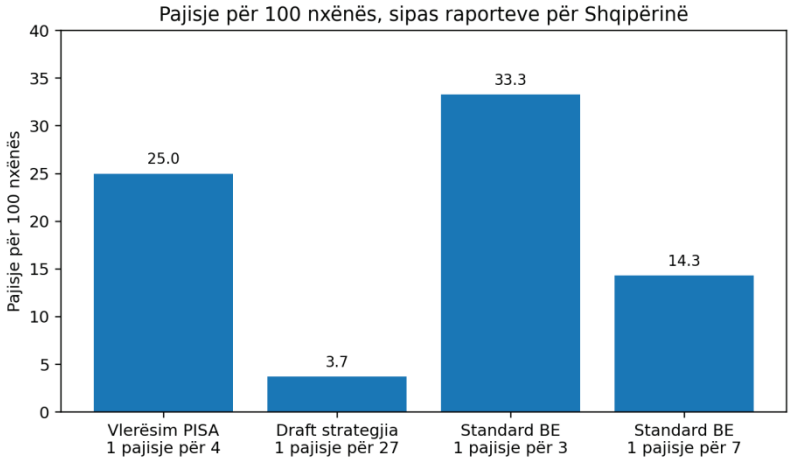
Grafiku tregon dominimin e anglishtes në arsimin e mesëm të lartë në Bashkimin Evropian. Kjo e bën mësimin e anglishtes dhe gjuhëve të tjera një fushë strategjike për përgatitjen e nxënësve për studime, punë dhe komunikim ndërkulturor.



Grafiku 2. Tregues të përvojës shkollore në Shqipëri, PISA 2022.

Burimi: OECD, 2023.

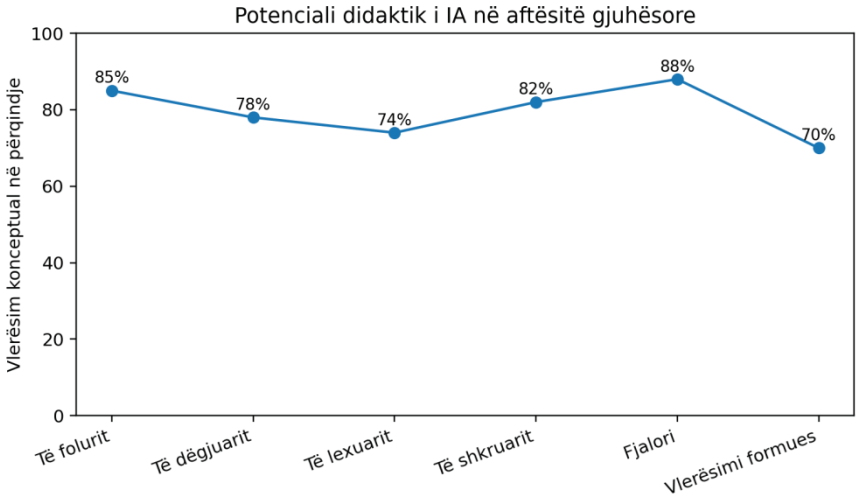
Treguesit e PISA sugjerojnë se marrëdhënia mësues nxënës ka rëndësi të madhe. Edhe në një mjedis digjital, nxënësi ka nevojë për ndihmë, interes, udhëzim dhe klimë pozitive. Kjo mbështet argumentin se inteligjenca artificiale nuk mund ta zëvendësojë rolin njerëzor të mësuesit.



Grafiku 3. Krahasim i aksesit në pajisje në shkolla.

Burimi: ITU dhe UNICEF, Albania Country Brief.

Grafiku evidenton se përdorimi i inteligjencës artificiale në shkollë lidhet drejtpërdrejt me infrastrukturën. Pa pajisje, internet, mirëmbajtje dhe akses të barabartë, IA mund të rrisë pabarazinë midis nxënësve në vend që ta zvogëlojë atë.



Grafiku 4. Vlerësim konceptual i potencialit të inteligjencës artificiale në aftësitë gjuhësore.

Ky grafik është ilustrues dhe shërben për të treguar fushat ku IA mund të japë mbështetje të fortë didaktike. Potenciali më i lartë lidhet me fjalorin, të folurit dhe të shkruarit, ndërsa vlerësimi formues kërkon kujdes të veçantë për shkak të rrezikut të përgjigjeve të pasakta ose të përgjithshme.

6. Analiza dhe diskutimi

6.1 Inteligjenca artificiale dhe të folurit

Të folurit është një nga aftësitë më të vështira për t'u zhvilluar në gjuhë të huaj, sepse kërkon vetëbesim, spontanitet dhe ekspozim të vazhdueshëm. Inteligjenca artificiale mund të krijojë dialogë të simuluar, role play, intervista, situata udhëtimi, biseda profesionale dhe ushtrime shqiptimi. Nxënësi mund të përsërisë pa frikën e gjykimit dhe të marrë sugjerime për shqiptimin, intonacionin dhe rrjedhshmërinë.

Megjithatë, komunikimi me një sistem artificial nuk duhet të zëvendësojë komunikimin mes nxënësve. Qëllimi është përgatitja për komunikim njerëzor. Prandaj, mësuesi mund ta përdorë IA si fazë paraprake dhe më pas të organizojë debat, prezantim ose dialog në çift.

6.2 Inteligjenca artificiale dhe të dëgjuarit

Në të dëgjuar, IA mund të ndihmojë në krijimin e teksteve zanore me nivele të ndryshme vështirësie, në përgatitjen e pyetjeve kuptimore dhe në përshtatjen e materialit sipas temës së mësimit. Nxënësit mund të dëgjojnë dialogë me ritëm të ndryshëm dhe të krahasojnë kuptimin e përgjithshëm me detaje specifike.

Mësuesi duhet të sigurojë që materiali zanor të jetë i përshtatshëm, i saktë dhe i lidhur me kulturën e gjuhës së huaj. Për gjuhët, cilësia e zërit, theksi, variacionet dialektore dhe konteksti kulturor kanë rëndësi të veçantë.

6.3 Inteligjenca artificiale dhe të lexuarit

Në të lexuar, IA mund të përgatisë tekste të shkallëzuara sipas nivelit A1, A2, B1 ose B2, të krijojë pyetje kuptimore, të nxjerrë fjalë kyçe dhe të shpjegojë struktura të vështira. Kjo është veçanërisht e dobishme në klasa heterogjene, ku nxënësit kanë nivele të ndryshme përgatitjeje.

Një përdorim cilësor është krahasimi i dy versioneve të të njëjtit tekst: versioni origjinal dhe versioni i thjeshtuar. Nxënësit mund të analizojnë ndryshimet në fjalor, sintaksë dhe stil. Kështu, IA nuk përdoret për të marrë përgjigje, por për të zhvilluar vetëdije gjuhësore.

6.4 Inteligjenca artificiale dhe të shkruarit

Të shkruarit është fusha ku inteligjenca artificiale mund të jetë shumë e dobishme, por edhe më problematike. Ajo mund të ndihmojë në planifikimin e tekstit, korrigjimin e gabimeve, zgjerimin e fjalorit, riformulimin e fjalive dhe përmirësimin e koherencës. Por e njëjta mundësi mund të kthehet në kopjim, nëse nxënësi dorëzon një tekst të prodhuar plotësisht nga IA.

Zgjidhja pedagogjike është të kërkohet procesi, jo vetëm produkti. Nxënësi mund të dorëzojë planin fillestar, draftin e parë, sugjerimet e marra nga IA, ndryshimet që pranoi ose refuzoi dhe reflektimin përfundimtar. Në këtë mënyrë, mësuesi vlerëson të menduarit dhe zhvillimin e aftësisë, jo vetëm tekstin final.

7. Modele praktike të përdorimit në orën e gjuhës së huaj

Modelet e mëposhtme mund të përshtaten për anglisht, frengjisht, italisht, gjermanisht ose gjuhë të tjera të huaja. Ato janë ndërtuar mbi parimin që IA të përdoret si mbështetje për të nxënit aktiv dhe jo si burim i gatshëm përgjigjesh.

Faza	Veprimtaria	Roli i nxënësit	Roli i IA	Roli i mësuesit
Para orës	Aktivizim i fjalorit për temën	Shkruan fjalë që njeh dhe pyetje që ka	Sugjeron kategori fjalori dhe shembuj	Përzgjedh fjalët e përshtatshme dhe sqaron kuptimet
Gjatë orës	Dialog i drejtuar	Praktikon pyetje dhe përgjigje	Simulon situatë komunikimi	Vëzhgon, ndërhyn dhe nxit bashkëpunimin
Pas orës	Reflektim me shkrim	Shkruan çfarë mësoi dhe ku gaboi	Jep sugjerime për përmirësim	Vlerëson procesin dhe jep feedback njerëzor
Vlerësim	Portofol i të nxënit	Dorëzon draftet dhe reflektimin	Ndihmon në rishikim gjuhësor	Kontrollon autorësinë dhe progresin

Tabela 5. Model i integrimit të IA në orën e gjuhës së huaj

Shembuj kërkesash të sigurta për nxënësit

Qëllimi	Kërkesa që mund të përdorë nxënësi	Pse është e dobishme
Fjalor	Më jep 12 fjalë për temën travel në nivelin B1 dhe përdori në fjali të shkurtra.	Zgjeron fjalorin në kontekst.
Dialog	Krijo një dialog në anglisht midis një turisti dhe një recepsionisti në hotel, niveli A2.	Nxit komunikimin funksional.
Korrigjim	Korrigjo tekstin tim, por shpjego vetëm tre gabimet më të rëndësishme.	Ndihmon të nxënit nga gabimi.
Të folur	Më bëj pesë pyetje për temën environment dhe prit përgjigjen time.	Krijon praktikë të drejtuar.
Mendim kritik	Më jep dy argumente pro dhe dy kundër përdorimit të rrjeteve sociale nga adoleshentët.	Ndihmon organizimin e debatit.

Tabela 6. Shembuj kërkesash për përdorim të kontrolluar të inteligjencës artificiale

Model ore mësimore

Elementi	Përshkrimi	Koha	Vlerësimi
Tema	Writing an opinion paragraph about technology	45 minuta	Vlerësim formues
Objektivi	Nxënësi shkruan një paragraf me opinion, arsye dhe shembull	5 minuta	Kontroll i objektivit
Aktivizim	Stuhi mendimesh për fjalët technology, learning, communication	7 minuta	Pjesëmarrje gojore

Përdorimi i IA	Nxënësi kërkon ide dhe fjalor, jo tekst të gatshëm	8 minuta	Kontroll i kërkesës së përdorur
Shkrim individual	Nxënësi shkruan draftin e parë pa kopjuar përgjigjen e IA	12 minuta	Draft i parë
Rishikim	IA sugjeron korrigjime, nxënësi zgjedh çfarë pranon	8 minuta	Shënime reflektuese
Mbyllje	Dy nxënës lexojnë paragrafët dhe klasa jep feedback	5 minuta	Feedback me rubrikë

Tabela 7. Model ore mësimore me integrim të kontrolluar të IA

8. Sfida, rreziqe dhe masa parandaluese

Përdorimi i inteligjencës artificiale në mësim nuk është pa rreziqe. Sfida e parë është varësia nga zgjidhjet e gatshme. Nëse nxënësi mësohet të marrë tekstin final nga sistemi, ai humbet mundësinë për të gabuar, për të reflektuar dhe për të ndërtuar vetë kompetencën gjuhësore.

Sfida e dytë është integriteti akademik. Mësuesi duhet të dallojë mes përdorimit të lejuar dhe përdorimit të palejuar. Për shembull, kërkimi i ideve, korrigjimi i një drafti ose shpjegimi i një gabimi mund të lejohen, ndërsa dorëzimi i një eseje të prodhuar plotësisht nga IA duhet të konsiderohet shkelje.

Sfida e tretë është mbrojtja e të dhënave personale. Nxënësit nuk duhet të fusin emra, fotografi, dokumente personale, nota, të dhëna familjare ose informacione sensitive në platforma që nuk janë miratuar nga institucioni. Në rastin e të miturve, kujdesi duhet të jetë edhe më i lartë.

Sfida e katërt lidhet me cilësinë dhe saktësinë. Sistemet e IA mund të prodhojnë përgjigje bindëse, por të pasakta. Për këtë arsye, çdo informacion duhet kontrolluar me burime të besueshme dhe me gjykim kritik.

Rreziku	**Shembull në klasë**	**Pasoja**	**Masa parandaluese**
Kopjim	Nxënësi dorëzon tekst të krijuar nga IA	Nuk zhvillohet aftësia e të shkruarit	Kërkohet draft, proces dhe reflektim
Varësi nga përkthimi	Çdo fjali përkthehet automatikisht	Dobësohet fjalori aktiv	Lejohet përkthim vetëm për krahasim dhe analizë
Informacion i pasaktë	IA jep rregull gramatikor të gabuar	Keqkuptim i strukturave	Mësuesi kontrollon dhe kërkon burim
Pabarazi digjitale	Disa nxënës nuk kanë pajisje ose internet	Pjesëmarrje e pabarabartë	Punë në grupe dhe përdorim i laboratorit
Privatësi	Nxënësi vendos të dhëna personale në platformë	Rrezik për sigurinë e të dhënave	Përdorim pa të dhëna identifikuese
Dobësim i mendimit kritik	Nxënësi pranon çdo përgjigje	Mësim pasiv	Kërkohet krahasim, argumentim dhe verifikim

Tabela 8. Rreziqet kryesore dhe masat parandaluese

9. Roli i mësuesit bashkëkohor

Mësuesi bashkëkohor nuk është më vetëm transmetues i informacionit. Në një mjedis ku informacioni gjendet lehtësisht, roli i tij zhvendoset drejt projektimit të përvojave të të nxënit, drejt ndërtimit të mendimit kritik dhe drejt garantimit të përdorimit etik të teknologjisë.

Në orën e gjuhës së huaj, mësuesi është organizues i komunikimit. Ai zgjedh tema të rëndësishme, krijon situata reale, i nxit nxënësit të flasin, të dëgjojnë njëri tjetrin, të bëjnë pyetje dhe të ndërtojnë kuptim. Inteligjenca artificiale mund të japë ushtrime, por nuk mund të krijojë vetë klimën emocionale dhe besimin që krijon mësuesi.

Mësuesi është edhe kurator i burimeve. Ai vendos cilat mjete janë të përshtatshme, cilat janë të sigurta dhe cilat u shërbejnë objektivave të orës. Jo çdo aplikacion është i vlefshëm për çdo moshë, lëndë ose nivel gjuhësor.

Mësuesi është model etik. Ai i mëson nxënësit të deklarojnë përdorimin e IA, të dallojnë ndihmën nga kopjimi, të ruajnë privatësinë dhe të kontrollojnë burimet. Kjo është një kompetencë e rëndësishme për qytetarinë digjitale.

Roli i mësuesit	Çfarë bën konkretisht	Rezultati për nxënësin
Projektues	Ndërton detyra ku IA ndihmon procesin, jo kopjimin	Nxënësi mëson të punojë me hapa
Udhëzues	Jep rregulla të qarta për përdorimin e IA	Nxënësi përdor teknologjinë me përgjegjësi
Kurator	Zgjedh burime dhe mjete të përshtatshme	Nxënësi ekspozohet ndaj materialeve cilësore
Vlerësues	Vlerëson draftin, reflektimin dhe progresin	Nxënësi kupton rëndësinë e procesit
Mbrojtës i etikës	Kujdeset për privatësinë dhe integritetin	Nxënësi zhvillon qytetari digjitale
Nxitës komunikimi	Kthen ushtrimin digjital në bisedë reale	Nxënësi përdor gjuhën në mënyrë aktive

Tabela 9. Profili i mësuesit bashkëkohor në mjedisin e IA

Protokoll i shkurtër për përdorimin e IA në klasë

- Përdorimi i IA duhet të lidhet gjithmonë me objektivin e orës mësimore.
- Nxënësi duhet të deklarojë kur ka përdorur IA dhe për çfarë qëllimi.
- Nuk lejohen të dhëna personale, fotografi, nota ose informacione familjare në platforma të hapura.
- Detyrat me shkrim duhet të përfshijnë draft, rishikim dhe reflektim.
- Mësuesi duhet të kontrollojë informacionin dhe të nxisë verifikimin në burime të besueshme.
- Vlerësimi duhet të fokusohet te procesi, mendimi kritik dhe komunikimi real.

10. Përfundime dhe rekomandime

Inteligjenca artificiale ka potencial të madh për të përmirësuar mësimin e gjuhëve të huaja. Ajo mund të ofrojë praktikë të personalizuar, dialogë të simuluar, feedback të shpejtë, materiale të përshtatura sipas nivelit dhe mundësi për vetëvlerësim. Këto janë veçanërisht të rëndësishme në klasa ku nxënësit kanë nivele të ndryshme dhe ku koha për praktikë individuale është e kufizuar.

Megjithatë, teknologjia nuk e zgjidh vetë problemin e të nxënit. Pa udhëzim pedagogjik, IA mund të kthehet në burim kopjimi, varësie dhe pasiviteti. Për këtë arsye, mësuesi mbetet figura kryesore që i jep kuptim përdorimit të saj.

Punimi arrin në përfundimin se IA duhet të integrohet në mësimin e gjuhëve të huaja sipas parimit: mësuesi udhëheq, nxënësi mendon, teknologjia ndihmon. Ky parim ruan ekuilibrin mes inovacionit dhe përgjegjësisë, mes efikasitetit digjital dhe komunikimit njerëzor.

Rekomandime për mësuesit

Të planifikojnë përdorimin e IA vetëm kur ajo i shërben objektivit mësimor.

Të kërkojnë nga nxënësit reflektim për mënyrën si e përdorën IA.

Të përdorin detyra që vlerësojnë procesin dhe jo vetëm përgjigjen finale.

Të zhvillojnë diskutime për etikën, privatësinë dhe integritetin akademik.

Rekomandime për shkollën

Të hartojë një udhëzim të brendshëm për përdorimin e IA.

Të organizojë trajnime për mësuesit mbi mjetet digjitale dhe sigurinë online.

Të sigurojë akses të barabartë në pajisje dhe internet.

Të përfshijë prindërit në ndërgjegjësimin për përdorimin e teknologjisë.

Rekomandime për nxënësit

Të përdorin IA për të mësuar, jo për të shmangur të menduarit.

Të mos dorëzojnë punë të krijuara plotësisht nga IA si punë personale.

Të kontrollojnë informacionin dhe të kërkojnë shpjegime për gabimet.

Të ruajnë privatësinë dhe të mos publikojnë të dhëna personale.

Gray Tsunami në Epokën Dixhitale!
Rreziqet dhe Mundësitë e Parandalimit!

Shpëtim Cami

Departamenti i Studimeve të Larta Administrative , Kolegji Universitar I Biznesit, Tiranë Shqipëri
shcami@kub.edu.al

Abstrakt

Ky punim analizon situatën demografike në Shqipëri, evidenton rritjen statistikore të numrit të të moshuarëve dhe politikat në funksion të kësaj situate. Numri I lartë I popullsisë së moshuar dhe zhvillimi teknologjik krijon probleme të përdorimit të teknologjisë nga kjo kategori ndaj janë analizuar dhe propozuar mundësitë e zgjidhjes.

Grey Tsunami është një term që po përdoret gjërësisht, sepse rritja e shpejtë e popullsisë së moshuar konsiderohet si një Cunam ndaj të cilit duhet të marrim masa së pari për ta parandaluar dhe së dyti për ta administruar me kujdes atë që nuk parandalojmë dot.

Politikat qeveritare për shtimin e popullsisë, organizatat joqeveritare me focus politikat e moshimit dhe kujdesin ndaj të moshuarëve , shkollat profesionale me programe " Kujdes për të moshuarit" , universitetet me programe për moshën mbi 50 vjeç siç quhen ndryshe "Universitete të moshës së tretë" dhe vetqeverisja vendore rekomandohen si aktorë të mundshëm për të kontribuar në parandalim dhe administrimin e këtij fenomeni.

Konsiderimi i përvojave ndërkombëtare dhe përfshirja e tyre në këtë studim e lehtëson të kuptuarit e këtij fenomeni , pranimin e rekomandimeve dhe angazhimin për kthimin e tyre në politika dhe plane veprimi.

Fjalë kyçe: *Grey Tsunami, Mosha e tretë, politika qeveritare, organizata joqeveritare, universitete, vetqeverisje vendore*

The Impact of Curriculum Change on Primary Education Teachers and Students

Lindita Mehmeti

"Hasan Prishtina" School
Local Office of Pre University Education, Tirana

Abstract

Changes in the primary education curriculum constitute an important reform process that directly affects the quality of teaching and students' learning outcomes. This paper aims to analyze the impact of curriculum change on teachers and students in primary education, focusing on the challenges, benefits, and adaptation to new contemporary methodologies. The implementation of a competency-based curriculum has brought changes in lesson planning, assessment methods, and the active role of students in the learning process. Teachers face the need for continuous professional development, the use of interactive methods, and the integration of technology into teaching. On the other hand, students benefit from a more inclusive and motivating approach, which encourages critical thinking, collaboration, and creativity. The study highlights that curricular changes have a positive impact on improving the quality of education, although they require institutional support, ongoing training, and cooperation among the school, parents, and educational institutions. Ultimately, curriculum reform is considered a key factor in improving the teaching and learning process and in preparing students for the challenges of modern society.

Keywords:*curriculum, primary education, teachers, students, competencies.*

1. Hyrje

Arsimi në Shqipëri po kalon një fazë të rëndësishme reformimi, e cila lidhet ngushtë me zbatimin e kurrikulave të reja në arsimin fillor, duke filluar nga viti shkollor 2026–2027. Këto ndryshime synojnë modernizimin e procesit mësimor, rritjen e cilësisë së arsimit dhe përafrimin e sistemit arsimor shqiptar me standardet evropiane të edukimit bashkëkohor. Në qendër të kurrikulës së re vendoset nxënësi, zhvillimi i kompetencave, mendimi kritik, kreativiteti, bashkëpunimi dhe përdorimi i metodave interaktive në mësimdhënie.

Kurrikula e re përfaqëson një qasje më bashkëkohore ndaj të nxënit, ku rëndësi të veçantë merr jo vetëm përvetësimi i njohurive, por edhe aftësia e nxënësit për t'i zbatuar ato në situata praktike të jetës së përditshme. Siç thekson edhe filozofia e edukimit aktiv e John Dewey, shkolla nuk duhet të formojë vetëm individë që mësojnë, por qytetarë që mendojnë, bashkëpunojnë dhe krijojnë të ardhmen. Në këtë kuptim, reforma kurrikulare synon të ndërtojë një proces mësimor më të gjallë, më gjithëpërfshirës dhe më të lidhur me nevojat reale të nxënësve.

Ndryshimet nga kurrikula ekzistuese përfshijnë mënyrën e planifikimit të orës së mësimit, format e vlerësimit, integrimin e teknologjisë, përfshirjen aktive të nxënësve dhe përdorimin e metodave gjithëpërfshirëse. Roli i mësuesit ndryshon nga transmetues i informacionit në udhëheqës, organizator dhe lehtësues të procesit të të nxënit. Kjo kërkon nga mësuesit përshtatje profesionale, përdorim të metodave të reja pedagogjike dhe një qasje më fleksibël ndaj nevojave të ndryshme të nxënësve.

Ky punim synon të analizojë ndikimin e kurrikulave të reja në arsimin fillor, duke evidentuar ndryshimet kryesore ndërmjet kurrikulës ekzistuese dhe asaj të re. Nëpërmjet këtij trajtimi do

të shqyrtohen sfidat dhe mundësitë që sjell reforma kurrikulare për mësuesit dhe nxënësit, si dhe rëndësia e saj në përmirësimin e cilësisë së procesit mësimor.

2. Rishikimi i literaturës

Kurrikula përbën një nga elementet më të rëndësishme të sistemit arsimor, sepse përcakton jo vetëm përmbajtjen që duhet të mësojnë nxënësit, por edhe mënyrën se si organizohet procesi i mësimdhënies dhe i të nxënit. Në arsimin bashkëkohor, kurrikula nuk shihet më vetëm si një listë lëndësh dhe temash mësimore, por si një dokument orientues që synon zhvillimin e njohurive, aftësive, qëndrimeve dhe kompetencave të nxënësve. Kjo qasje është në përputhje me orientimet ndërkombëtare për arsimin, ku theksohet se shkolla duhet të përgatisë nxënësit për të menduar në mënyrë kritike, për të bashkëpunuar, për të zgjidhur probleme dhe për t'u përshtatur me kërkesat e shoqërisë moderne. OECD thekson se arsimi duhet t'i pajisë të rinjtë me kompetenca, ndjenjë përgjegjësie dhe aftësi për të kontribuar në shoqëri.

Kurrikula me bazë kompetencash ka marrë rëndësi të veçantë në shumë sisteme arsimore. Ajo synon që nxënësi të mos kufizohet vetëm në marrjen e informacionit, por të jetë i aftë ta përdorë atë në situata të ndryshme praktike. Sipas dokumenteve kurrikulare të arsimit parauniversitar në Shqipëri, kompetencat kyçe lidhen me komunikimin, të menduarit, të nxënit gjatë gjithë jetës, qytetarinë, aftësitë personale dhe kompetencën digjitale. Kjo tregon se kurrikula synon formimin e një nxënësi të aftë për të vepruar në mënyrë të pavarur, krijuese dhe të përgjegjshme.

Reformat kurrikulare në Shqipëri lidhen me nevojën për modernizimin e arsimit dhe përafrimin e tij me standardet evropiane. Ministria e Arsimit dhe Sportit ka theksuar se arsimi parauniversitar po orientohet drejt kurrikulave të reja mësimore dhe trajnimit profesional të mësuesve, si pjesë e përmirësimit të cilësisë së arsimit. Sipas këtij burimi, zbatimi i kurrikulave të reja parashikohet të fillojë në vitin shkollor 2026–2027 për disa klasa, duke përfshirë edhe arsimin fillor.

Një aspekt i rëndësishëm i literaturës lidhet me ndryshimin e rolit të mësuesit. Në kurrikulën tradicionale, mësuesi shpesh shihej si burimi kryesor i informacionit, ndërsa nxënësi kishte një rol më pasiv. Në qasjen bashkëkohore, mësuesi bëhet udhëheqës, organizator dhe lehtësues i procesit mësimor. Ai krijon situata të nxëni ku nxënësit përfshihen aktivisht, diskutojnë, bashkëpunojnë dhe ndërtojnë njohuri përmes përvojës. Kjo qasje lidhet edhe me filozofinë pedagogjike të John Dewey, i cili theksonte rëndësinë e edukimit aktiv, përvojës dhe pjesëmarrjes së nxënësit në procesin e të nxënit.

Rishikimi i literaturës tregon gjithashtu se zbatimi i një kurrikule të re kërkon zhvillim të vazhdueshëm profesional të mësuesve. Për të realizuar me sukses mësimdhënien e bazuar në kompetenca, mësuesit duhet të zotërojnë metoda interaktive, teknika të ndryshme vlerësimi, aftësi për menaxhimin e klasës dhe njohuri për përdorimin e teknologjisë në mësimdhënie. UNESCO thekson se në Shqipëri po zhvillohen nisma për aftësimin e mësuesve në përdorimin e mjeteve digjitale në klasë në mënyrë të sigurt, etike dhe efektive.

Integrimi i teknologjisë në arsim është një tjetër element i rëndësishëm i reformave kurrikulare. Përdorimi i mjeteve digjitale ndihmon në rritjen e motivimit të nxënësve, në pasurimin e burimeve mësimore dhe në zhvillimin e aftësive digjitale. Strategjitë e fundit për arsimin në Shqipëri i kushtojnë rëndësi zhvillimit të kompetencave digjitale dhe përdorimit të teknologjisë si pjesë e përgatitjes së nxënësve për të ardhmen.

Nga ana e nxënësve, ndryshimet kurrikulare ndikojnë në rritjen e pjesëmarrjes aktive në mësim, në zhvillimin e mendimit kritik, kreativitetit dhe bashkëpunimit. Nxënësit nuk janë më vetëm dëgjues të informacionit, por bëhen pjesëmarrës aktivë në procesin e të nxënit. Përmes punës në

grup, projekteve, diskutimeve dhe detyrave praktike, ata zhvillojnë aftësi që i ndihmojnë jo vetëm në shkollë, por edhe në jetën e përditshme.

Literatura thekson se zbatimi i reformave kurrikulare nuk është një proces i lehtë. Ai kërkon kohë, përgatitje, mbështetje institucionale, materiale mësimore të përshtatshme dhe bashkëpunim ndërmjet shkollës, familjes dhe institucioneve arsimore. OECD e trajton ndryshimin kurrikular si një proces që përfshin shumë aktorë, si nxënësit, mësuesit, drejtuesit e shkollave, prindërit dhe politikëbërësit.

Ndryshimi i kurrikulës në arsimin fillor është një proces i domosdoshëm për përmirësimin e cilësisë së arsimit. Kurrikulat e reja synojnë të krijojnë një proces mësimor më aktiv, më gjithëpërfshirës dhe më të orientuar drejt zhvillimit të kompetencave. Ato ndikojnë si te mësuesit, të cilët duhet të përshtatin metodat dhe rolin e tyre, ashtu edhe te nxënësit, të cilët përfitojnë nga një mësim më praktik, më motivues dhe më i lidhur me jetën reale.

3. Metodologjia

Ky studim ka karakter teorik, përshkrues dhe analitik. Ai mbështetet në shqyrtimin e literaturës pedagogjike, dokumenteve zyrtare, udhëzuesve kurrikularë dhe studimeve ekzistuese që trajtojnë reformën kurrikulare në arsimin fillor. Duke qenë se në këtë fazë nuk janë përdorur pyetësorë, intervista apo vëzhgime në terren, të dhënat e studimit janë marrë nga burime dytësore.

Qëllimi i metodologjisë është të analizojë ndikimin e pritshëm të kurrikulave të reja në arsimin fillor në Shqipëri gjatë vitit shkollor 2026–2027. Përmes kësaj qasjeje synohet të evidentohen ndryshimet kryesore nga kurrikula ekzistuese, si dhe efektet e mundshme që këto ndryshime mund të kenë tek mësuesit dhe nxënësit.

Për realizimin e studimit është përdorur analiza e literaturës, e cila ka shërbyer për të shqyrtuar koncepte teorike mbi kurrikulën, arsimin me bazë kompetencash, rolin e mësuesit dhe përfshirjen aktive të nxënësit në procesin mësimor. Gjithashtu, është përdorur analiza dokumentare për të shqyrtuar dokumente zyrtare, materiale kurrikulare dhe udhëzues arsimorë që lidhen me reformën në arsimin fillor.

Një metodë tjetër e përdorur është metoda krahasuese, përmes së cilës janë evidentuar ndryshimet ndërmjet kurrikulës ekzistuese dhe kurrikulës së re. Krahasimi është përqendruar në disa aspekte kryesore, si metodat e mësimdhënies, format e vlerësimit, roli i mësuesit, roli i nxënësit, integrimi i teknologjisë dhe qasja gjithëpërfshirëse.

Në kuadër të kësaj metodologjie janë përfshirë edhe pyetjet kërkimore, të cilat shërbejnë për të orientuar analizën teorike të punimit. Pyetjet kërkimore të këtij studimi janë:

1. Cilat janë ndryshimet kryesore ndërmjet kurrikulës ekzistuese dhe kurrikulës së re?
2. Si pritet të ndikojnë këto ndryshime në punën e mësuesve të arsimit fillor?
3. Çfarë ndikimi të mundshëm kanë kurrikulat e reja tek nxënësit dhe procesi i të nxënit?
4. Cilat janë sfidat kryesore që mund të shfaqen gjatë zbatimit të reformës kurrikulare?
5. Sa e rëndësishme është përgatitja profesionale e mësuesve për zbatimin e kurrikulës së re?

Të dhënat e mbledhura janë analizuar në mënyrë përshkruese dhe interpretuese. Kjo ka bërë të mundur shqyrtimin e ndikimeve të pritshme të reformës kurrikulare, sfidave të zbatimit dhe mundësive që ajo krijon për përmirësimin e procesit mësimor në arsimin fillor.

Ky studim ka si kufizim faktin se nuk përfshin të dhëna empirike nga terreni. Përfundimet mbështeten në analizën e materialeve teorike dhe dokumentare, pasi kurrikulat e reja pritet të

zbatohen në vitin shkollor 2026–2027 dhe ndikimi i tyre praktik ende nuk mund të matet plotësisht.

4. Analiza dhe diskutimi

Analiza e ndryshimeve ndërmjet kurrikulës ekzistuese dhe kurrikulës së re tregon se arsimi fillor po orientohet drejt një modeli më bashkëkohor, ku rëndësi nuk ka vetëm përvetësimi i njohurive, por edhe zhvillimi i kompetencave, aftësive praktike, mendimit kritik dhe kreativitetit të nxënësve. Kjo nënkupton se kurrikula e re nuk synon thjesht ndryshimin e përmbajtjeve mësimore, por transformimin e mënyrës se si organizohet dhe zhvillohet procesi i të nxënit.

Kalimi nga fokusi tek përmbajtja drejt fokusit tek kompetencat dhe aftësitë. Në kurrikulën ekzistuese, rëndësi e madhe i është dhënë transmetimit të njohurive dhe përvetësimit të informacionit nga nxënësi. Kjo qasje shpesh ka bërë që nxënësi të mësojë për të riprodhuar atë që i është dhënë nga mësuesi apo teksti shkollor. Ndërsa kurrikula e re kërkon që njohuritë të lidhen me përdorimin praktik të tyre. Nxënësi duhet të jetë në gjendje të analizojë, të krahasojë, të argumentojë, të zgjidhë probleme dhe të përdorë atë që mëson në situata të ndryshme jetësore dhe shkollore. Ky ndryshim është thelbësor, sepse e zhvendos arsimin nga mësimi mekanik drejt të nxënit funksional. Kalimi nga mësuesi në qendër të procesit drejt nxënësit në qendër të procesit. Në modelin tradicional, mësuesi ka qenë figura kryesore që shpjegon, udhëzon dhe kontrollon procesin mësimor, ndërsa nxënësi shpesh ka pasur rol më pasiv. Kurrikula e re kërkon që nxënësi të jetë pjesëmarrës aktiv në mësim. Ai duhet të pyesë, të diskutojë, të reflektojë, të bashkëpunojë me të tjerët dhe të marrë përgjegjësi për të nxënit e tij. Kjo qasje ndihmon në rritjen e vetëbesimit të nxënësve dhe në zhvillimin e pavarësisë së tyre në të menduar. Ndryshimi i metodave të mësimdhënies është një nga aspektet më të dukshme të kurrikulës së re. Kalimi nga metodat tradicionale drejt metodave interaktive dhe bashkëpunuese tregon se procesi mësimor duhet të bëhet më dinamik dhe më i afërt me nevojat e nxënësve. Metodat tradicionale, të bazuara kryesisht në shpjegim, dëgjim dhe riprodhim, nuk janë gjithmonë të mjaftueshme për të zhvilluar aftësitë e shekullit të ri. Për këtë arsye, kurrikula e re i jep rëndësi punës në grup, diskutimeve, projekteve, lojërave mësimore, zgjidhjes së situatave problemore dhe aktiviteteve praktike. Këto metoda e bëjnë nxënësin më aktiv dhe e ndihmojnë të mësojë përmes përvojës.

Një aspekt tjetër me rëndësi është ndryshimi në vlerësim. Në kurrikulën ekzistuese, vlerësimi është lidhur kryesisht me notën dhe me matjen e rezultateve përfundimtare. Ky lloj vlerësimi shpesh e vendos nxënësin nën presion dhe nuk tregon gjithmonë qartë procesin e përparimit të tij. Kurrikula e re i jep rëndësi vlerësimit gjithëpërfshirës dhe formues. Kjo do të thotë se vlerësimi nuk duhet të përdoret vetëm për të vendosur një notë, por edhe për të ndihmuar nxënësin të kuptojë ku ndodhet, çfarë ka arritur dhe çfarë duhet të përmirësojë. Në këtë mënyrë, vlerësimi bëhet pjesë e procesit të të nxënit dhe jo vetëm një kontroll në fund të tij.

Integrimi më i madh i teknologjisë përbën një tjetër element të rëndësishëm të kurrikulës së re. Në kurrikulën ekzistuese, teknologjia shpesh është përdorur në mënyrë të kufizuar ose vetëm si mjet ndihmës. Ndërsa në kurrikulën e re, teknologjia shihet si pjesë e rëndësishme e procesit mësimor. Përdorimi i mjeteve digjitale mund ta bëjë mësimin më tërheqës, më konkret dhe më të kuptueshëm për nxënësit. Megjithatë, ky ndryshim kërkon që mësuesit të jenë të përgatitur për përdorimin e teknologjisë dhe që shkollat të kenë kushtet e nevojshme infrastrukturore. Nëse teknologjia nuk përdoret në mënyrë të qëllimshme dhe të organizuar, ajo mund të mbetet vetëm një element formal dhe jo një mjet real për përmirësimin e të nxënit.

Qasja gjithëpërfshirëse është ndryshim thelbësor. Kurrikula ekzistuese ka qenë më shumë e orientuar drejt një modeli standard për të gjithë nxënësit, duke mos marrë gjithmonë parasysh dallimet individuale, ritmet e ndryshme të të nxënit dhe nevojat specifike të secilit fëmijë.

Kurrikula e re kërkon një qasje më fleksibël, ku mësuesi përshtat metodat, materialet dhe mënyrat e vlerësimit sipas nevojave të nxënësve. Kjo është veçanërisht e rëndësishme në arsimin fillor, sepse në këtë nivel formohen bazat e zhvillimit intelektual, social dhe emocional të fëmijës.

Kalimi nga memorizimi drejt mendimit kritik dhe kreativitetit. Në modelin tradicional, nxënësi shpesh vlerësohej për aftësinë për të mbajtur mend dhe për të përsëritur informacionin. Kurrikula e re kërkon që nxënësi të shkojë përtej memorizimit. Ai duhet të mendojë në mënyrë kritike, të bëjë pyetje, të japë mendime, të kërkojë zgjidhje alternative dhe të shprehë kreativitetin e tij. Ky ndryshim është shumë i rëndësishëm, sepse përgatit nxënësit jo vetëm për shkollën, por edhe për jetën.

Zbatimi i këtyre ndryshimeve nuk është i lehtë. Një nga sfidat kryesore lidhet me përgatitjen profesionale të mësuesve. Kurrikula e re kërkon nga mësuesi jo vetëm të njohë përmbajtjen mësimore, por edhe të përdorë metoda të ndryshme, të organizojë aktivitete ndërvepruese, të vlerësojë në mënyrë formuese dhe të menaxhojë një klasë ku nxënësit janë më aktivë. Kjo kërkon trajnime të vazhdueshme, mbështetje profesionale dhe kohë për përshtatje.

Një tjetër sfidë lidhet me kushtet konkrete në shkolla. Për të zbatuar me sukses kurrikulën e re, nuk mjafton vetëm ndryshimi i dokumenteve. Nevojiten materiale mësimore të përshtatshme, mjete teknologjike, ambiente të përshtatshme për punë në grup dhe një numër i menaxhueshëm nxënësish në klasë. Nëse këto kushte mungojnë, mësuesit mund ta kenë të vështirë ta zbatojnë kurrikulën në mënyrë efektive. Kurrikula e re krijon mundësi të rëndësishme për përmirësimin e cilësisë së arsimit fillor. Ajo e bën mësimin më të lidhur me jetën, më praktik dhe më të orientuar drejt zhvillimit të plotë të fëmijës. Nxënësit kanë më shumë mundësi të shprehen, të bashkëpunojnë, të krijojnë dhe të zhvillojnë aftësi që u nevojiten për të ardhmen. Në të njëjtën kohë, mësuesi merr një rol më të gjerë, jo vetëm si transmetues i njohurive, por si udhëheqës, mbështetës dhe organizues i procesit të të nxënit.

Diskutimi tregon se kurrikula e re përfaqëson një ndryshim të rëndësishëm në arsimin fillor. Ajo synon të kalojë nga një model tradicional, i bazuar tek përmbajtja, nota dhe memorizimi, drejt një modeli më aktiv, gjithëpërfshirës dhe të orientuar drejt kompetencave. Suksesi i saj do të varet nga përgatitja e mësuesve, mbështetja institucionale, kushtet në shkolla dhe mënyra se si këto ndryshime do të zbatohen në praktikën e përditshme mësimore. Tabela më poshtë do të jap informacion të përmbledhur mbi krahasimin e kurrikulës ekzistuese dhe asaj të re që pritet të pilotohet në shtator të vitit 2026.

Tabela 1. Krahasimi ndërmjet kurrikulës ekzistuese dhe kurrikulës së re në arsimin fillor

Kurrikula ekzistuese	**Kurrikula e re**
Fokus kryesisht tek përmbajtja	Fokus tek kompetencat dhe aftësitë
Mësuesi në qendër të procesit	Nxënësi në qendër të procesit
Metoda tradicionale	Metoda interaktive dhe bashkëpunuese
Vlerësim kryesisht me nota	Vlerësim gjithëpërfshirës dhe formues
Përdorim i kufizuar i teknologjisë	Integrim më i madh i teknologjisë
Mësim standard për të gjithë	Qasje gjithëpërfshirëse sipas nevojave të nxënësit
Fokus tek memorizimi	Fokus tek mendimi kritik dhe kreativiteti

Krahasimi ndërmjet kurrikulës ekzistuese dhe kurrikulës së re në arsimin fillor paraqet ndryshimet kryesore në mënyrën e organizimit të procesit mësimor, duke krahasuar modelin tradicional me qasjen e re të orientuar drejt kompetencave. Ajo tregon se kurrikula e re vendos më shumë theks te roli aktiv i nxënësit, metodat bashkëpunuese, vlerësimi formues, përdorimi i teknologjisë dhe zhvillimi i mendimit kritik e kreativ.

Tabela 2. Krahasimi i ndryshimeve kurrikulare sipas fushave, lëndëve dhe praktikave mësimore në arsimin fillor

Fusha / Lënda	Kurrikula ekzistuese	Kurrikula e re	Shembull konkret
Gjuhë Shqipe	Fokus tek memorizimi dhe riprodhimi i njohurive. Ushtrime gramatikore tradicionale dhe pyetje të mbyllura.	Fokus tek komunikimi, mendimi kritik, diskutimi dhe interpretimi. Përdorim i teknologjisë dhe metodave interaktive.	Në programin e vjetër nxënësi riprodhonte tregimin; në kurrikulën e re analizon personazhet dhe krijon fund alternativ.
Matematikë	Zgjidhje mekanike ushtrimesh dhe memorizim formulash. Pak lidhje me jetën reale.	Matematikë funksionale, zgjidhje problemesh praktike, lojëra logjike dhe punë në grup.	Më parë kryheshin vetëm veprime matematikore; sot nxënësi llogarit buxhet familjar ose organizon blerje reale.
Shkencat e Natyrës	Mësim teorik dhe memorizim faktesh. Eksperimentet realizoheshin rrallë.	Mësim përmes eksperimentimit, kërkimit shkencor dhe vëzhgimit praktik.	Në programin e vjetër mësoheshin pjesët e bimës teorikisht; sot nxënësi mbjell dhe vëzhgon zhvillimin e saj.
Shoqëria dhe Mjedisi	Informacion teorik historik dhe gjeografik. Pak aktivitete praktike.	Edukim qytetar aktiv, projekte komunitare dhe ndërgjegjësim mjedisor.	Më parë nxënësi mësonte vetëm institucionet; sot zhvillon debate dhe simulime zgjedhjesh në klasë.
Artet	Aktivitetet realizoheshin sipas modelit të mësuesit. Kreativitet i kufizuar.	Shprehje e lirë artistike dhe projekte krijuese bashkëpunuese.	Më parë kopjohej vizatimi; sot nxënësi krijon posterë, video dhe punime artistike personale.
Edukimi Fizik, Sportet dhe Shëndeti	Fokus vetëm tek ushtrimet fizike dhe sporti.	Përfshirje e edukimit shëndetësor, emocional dhe bashkëpunues.	Përveç sportit, nxënësit diskutojnë për ushqyerjen e shëndetshme dhe mirëqenien emocionale.
Teknologjia dhe TIK	Përdorim i kufizuar i kompjuterit dhe njohuri bazë teknike.	Integrim i teknologjisë në çdo lëndë dhe përdorim i Smart Lab.	Nxënësi realizon prezantime, kuize online dhe projekte multimediale.
Metodologjia e mësimdhënies	Mësuesi transmetues kryesor i informacionit.	Nxënësi në qendër të procesit mësimor.	Punë në grup, diskutime, projekte dhe të nxënë aktiv.
Vlerësimi	Vlerësim kryesisht me teste dhe nota përfundimtare.	Vlerësim i vazhdueshëm sipas kompetencave dhe performancës.	Përdorim portfoliosh, vetëvlerësim dhe vlerësim në grup.
Roli i nxënësit	Nxënës pasiv dhe dëgjues.	Nxënës aktiv, krijues dhe bashkëpunues.	Prezantime, projekte kërkimore dhe aktivitete praktike.
Roli i mësuesit	Autoritet kryesor dhe shpjegues i informacionit.	Orientues ,udhëzues dhe mbështetës i të nxënit.	Organizim aktivitetesh interaktive dhe përdorim metodash bashkëkohore.

Tabela nr 2, paraqet në mënyrë të përmbledhur ndryshimet kryesore që sjell kurrikula e re në raport me kurrikulën ekzistuese. Përmes fushave dhe lëndëve të ndryshme, tabela tregon se procesi mësimor po kalon nga një qasje tradicionale, e bazuar kryesisht në memorizim, riprodhim njohurish dhe ushtrime mekanike, drejt një qasjeje më aktive, praktike, krijuese dhe të orientuar nga kompetencat. Duke u mbështetur në këtë tabelë, mund të thuhet se ndryshimet kryesore ndërmjet kurrikulës ekzistuese dhe kurrikulës së re lidhen me mënyrën se si zhvillohet procesi i të nxënit. Në kurrikulën ekzistuese, nxënësi shpesh ka qenë i përqendruar te memorizimi i informacionit, riprodhimi i njohurive dhe zgjidhja e ushtrimeve sipas modeleve të dhëna nga mësuesi. Ndërsa në kurrikulën e re, rëndësi më e madhe i jepet zhvillimit të kompetencave, mendimit kritik, kreativitetit, komunikimit dhe përdorimit praktik të njohurive. Për shembull, në Gjuhën Shqipe nxënësi nuk kufizohet vetëm në riprodhimin e një tregimi, por nxitet të analizojë personazhet, të interpretojë mesazhin dhe të krijojë një fund alternativ. Në Matematikë, ndryshimi shihet te kalimi nga zgjidhja mekanike e ushtrimeve drejt përdorimit të njohurive matematikore në situata të jetës së përditshme, si llogaritja e një buxheti familjar apo organizimi i blerjeve. Po ashtu, në Shkencat e Natyrës, nxënësi nuk mëson vetëm teorikisht pjesët e bimës, por përfshihet në vëzhgime, eksperimente dhe veprimtari praktike. Këto ndryshime pritet të ndikojnë në mënyrë të drejtpërdrejtë edhe në punën e mësuesve të arsimit fillor. Mësuesi nuk shihet më vetëm si transmetues i informacionit, por si udhëzues, organizues dhe mbështetës i procesit të të nxënit. Ai duhet të krijojë situata mësimore ku nxënësit të marrin pjesë aktivisht, të punojnë në grup, të diskutojnë, të eksperimentojnë dhe të paraqesin idetë e tyre. Kjo kërkon një planifikim më të kujdesshëm të orës mësimore, përdorim të metodave interaktive dhe përshtatje të veprimtarive sipas nevojave të nxënësve. Për shembull, në vend që mësuesi të kërkojë vetëm riprodhimin e një teksti, ai duhet të nxisë analizën, diskutimin dhe krijimtarinë. Në këtë mënyrë, puna e mësuesit bëhet më e pasur dhe më krijuese, por njëkohësisht edhe më kërkuese, sepse kërkon përgatitje profesionale, menaxhim të mirë të klasës dhe përdorim të mjeteve të ndryshme mësimore.Kurrikula e re pritet të ketë ndikim pozitiv edhe tek nxënësit dhe procesi i të nxënit. Duke qenë se nxënësi vendoset në qendër të procesit mësimor, ai nuk mbetet më vetëm dëgjues pasiv, por bëhet pjesëmarrës aktiv në ndërtimin e njohurive. Ai mëson duke diskutuar, duke kërkuar, duke eksperimentuar, duke bashkëpunuar dhe duke krijuar produkte konkrete. Kjo qasje ndihmon në zhvillimin e mendimit kritik, kreativitetit, aftësive komunikuese dhe aftësive praktike. Për shembull, në Shkencat e Natyrës, nxënësi mund të mbjellë një bimë dhe të vëzhgojë zhvillimin e saj, ndërsa në Teknologji dhe TIK mund të realizojë prezantime, kuize online apo projekte multimediale. Në këtë mënyrë, të nxënit bëhet më i kuptueshëm, më tërheqës dhe më i lidhur me jetën reale. Zbatimi i kurrikulës së re mund të shoqërohet edhe me disa sfida. Një nga sfidat kryesore është përgatitja e mësuesve për të përdorur metoda bashkëkohore, vlerësim formues, teknologji dhe qasje gjithëpërfshirëse. Nëse mësuesit nuk trajnohen dhe nuk mbështeten në mënyrë të vazhdueshme, ndryshimet mund të mbeten vetëm në nivel teorik dhe të mos zbatohen plotësisht në praktikë. Një tjetër sfidë lidhet me kushtet materiale dhe teknologjike në shkolla. Përdorimi i Smart Lab, mjeteve digjitale, eksperimenteve dhe projekteve kërkon pajisje, internet, materiale mësimore dhe ambiente të përshtatshme. Gjithashtu, puna në grup dhe vlerësimi i vazhdueshëm kërkojnë më shumë kohë dhe organizim nga ana e mësuesit. Prandaj, suksesi i reformës varet jo vetëm nga përmbajtja e kurrikulës, por edhe nga mundësitë reale që shkollat dhe mësuesit kanë për ta zbatuar atë.

Përgatitja profesionale e mësuesve është një element shumë i rëndësishëm për zbatimin e suksesshëm të kurrikulës së re. Mësuesi është personi që e kthen kurrikulën nga dokument zyrtar në praktikë të përditshme mësimore. Për këtë arsye, ai duhet të jetë i trajnuar për planifikimin sipas kompetencave, përdorimin e metodave interaktive, integrimin e teknologjisë, vlerësimin formues dhe përshtatjen e mësimit sipas nevojave të nxënësve. Një mësues i përgatitur mirë arrin të krijojë një mjedis mësimor më aktiv, më gjithëpërfshirës dhe më motivues për nxënësit. Prandaj, trajnimet e vazhdueshme, bashkëpunimi mes mësuesve,

udhëzimet praktike dhe mbështetja institucionale janë kushte të domosdoshme për të siguruar që kurrikula e re të mos mbetet vetëm një ndryshim formal, por të sjellë përmirësim real në cilësinë e arsimit fillor.

5. Përfundime dhe rekomandime

Nga analiza e ndryshimeve ndërmjet kurrikulës ekzistuese dhe kurrikulës së re në arsimin fillor, del se reforma kurrikulare synon kalimin nga një model tradicional, i bazuar kryesisht në memorizim, riprodhim njohurish dhe vlerësim me nota, drejt një modeli më bashkëkohor, të orientuar nga kompetencat, mendimi kritik, kreativiteti dhe pjesëmarrja aktive e nxënësit. Kurrikula e re e vendos nxënësin në qendër të procesit mësimor dhe kërkon që ai të mësojë përmes diskutimit, bashkëpunimit, eksperimenteve, projekteve dhe lidhjes së njohurive me jetën reale. Kjo qasje pritet të ndikojë pozitivisht në zhvillimin e aftësive praktike, sociale dhe krijuese të nxënësve, duke e bërë procesin e të nxënit më të kuptueshëm dhe më tërheqës. Megjithatë, zbatimi i suksesshëm i kurrikulës së re kërkon përgatitje të vazhdueshme profesionale të mësuesve, mbështetje institucionale dhe kushte më të mira në shkolla. Rekomandohet që mësuesit të trajnohen në mënyrë praktike për përdorimin e metodave interaktive, vlerësimin formues, integrimin e teknologjisë dhe përshtatjen e mësimdhënies sipas nevojave të nxënësve. Gjithashtu, shkollat duhet të pajisen me materiale didaktike, mjete teknologjike dhe ambiente të përshtatshme për punë në grup, projekte dhe veprimtari praktike. Vetëm përmes bashkëpunimit ndërmjet mësuesve, drejtuesve të shkollave, prindërve dhe institucioneve arsimore, kurrikula e re mund të zbatohet me sukses dhe të sjellë përmirësim real në cilësinë e arsimit fillor.

Advances in Vehicle Safety: Active, Passive and Integrated Protection Systems

Aleksander Lulaj[1], Miranda Kullolli[2]

[1]EVU Albania Member
Student of TU Graz – Traffic Accident Research
[2]Higher Professional Studies College, UCB, Tirana, Albania

Abstract

Road traffic accidents remain one of the leading causes of fatalities worldwide, with approximately 1.19 million deaths reported annually. Vehicle safety therefore plays a fundamental role in reducing both the number of accidents and the severity of injuries. This paper presents an overview of modern vehicle safety systems, focusing on active safety, passive safety, occupant protection, vulnerable road user protection, infrastructure safety, and evaluation methods used in contemporary vehicle development. The study explains how active safety systems such as ABS, ESC, lane departure warning, and autonomous emergency braking are designed to prevent or mitigate accidents before impact, while passive safety systems aim to reduce injury severity during and after collisions through energy absorption structures, restraint systems, airbags, and optimized vehicle crash structures. Particular attention is given to vulnerable road users, including pedestrians, cyclists, and motorcyclists, who represent a significant proportion of road fatalities in urban areas. Additionally, the paper discusses modern evaluation methods such as physical crash testing, virtual simulations, and hybrid testing approaches, as well as the role of regulatory and consumer testing programs like Euro NCAP in improving vehicle safety standards. The results demonstrate that integrated safety concepts combining vehicle technology, infrastructure improvements, and advanced driver assistance systems significantly contribute to reducing traffic injuries and fatalities.

Keywords: *Vehicle Safety, Active Safety, Passive Safety, Occupant Protection, Euro NCAP*

Kampuset e gjelbërta, domosdoshmëri në arsimin professional

Aida Murrja

Shkolla e mesme profesionale "Nazmi Rushiti", Peshkopi

Abstrakt

Transformimi i institucioneve të arsimit profesional në kampuse të gjelbra dhe inteligjente përbën një nga prioritetet kryesore të politikave bashkëkohore për zhvillim të qëndrueshëm dhe edukim cilësor. Arsimi profesional luan një rol kyç në përgatitjen e fuqisë punëtore për ekonominë e gjelbër dhe tranzicionin ekologjik global. Në kushtet e zhvillimeve të shpejta teknologjike dhe sfidave globale mjedisore, institucionet e arsimit profesional po përballen me nevojën për të adoptuar modele të qëndrueshme dhe inovative të menaxhimit institucional.

Ky punim synon të analizojë ndikimin e integrimit të teknologjive inteligjente dhe energjisë së rinovueshme në institucionet e arsimit profesional në Shqipëri. Studimi mbështetet në metodën e analizës teorike dhe krahasuese të literaturës shkencore bashkëkohore UNESCO-UNEVOC, OECD dhe literaturës akademike mbi qëndrueshmërinë në arsim, duke u fokusuar në praktikat më të avancuara të kampuseve të gjelbra në vendet evropiane. Në mënyrë të veçantë, analizohen përdorimi i sensorëve inteligjentë, sistemeve të automatizuara për menaxhimin e energjisë, paneleve fotovoltaike dhe teknologjive digjitale që kontribuojnë në reduktimin e konsumit energjetik dhe uljen e ndotjes mjedisore.

Gjetjet e studimit tregojnë se integrimi i praktikave të qëndrueshme në arsimin profesional ndikon pozitivisht jo vetëm në eficiencën ekonomike dhe mbrojtjen e mjedisit, por edhe në zhvillimin e kompetencave profesionale të nxënësve për tregun e gjelbër të punës. Për më tepër, kampuset inteligjente krijojnë mundësi për edukim praktik, inovacion dhe ndërgjegjësim mjedisor brenda komunitetit shkollor.

Në përfundim, punimi rekomandon rritjen e investimeve në infrastrukturë të gjelbër, trajnimin e stafit pedagogjik dhe harmonizimin e politikave arsimore me standardet ndërkombëtare të qëndrueshmërisë.

Fjalë kyçe: *kampus inteligjent i gjelbër, qëndrueshmëri, teknologji inteligjente, energji e rinovueshme, arsimi profesional, inovacion ekologjik.*

1. Hyrje

Transformimi i shpejtë teknologjik, sfidat klimatike dhe kërkesat e tregut modern të punës kanë sjellë nevojën për rikonceptimin e rolit të arsimit profesional në shoqërinë bashkëkohore. Në këtë kontekst, përfshirja e aftësive të gjelbra dhe aftësive digjitale konsiderohet një nga prioritetet kryesore të politikave arsimore në nivel europian dhe global. Organizata ndërkombëtare si UNESCO, OECD dhe Bashkimi Europian theksojnë se arsimi profesional duhet të përgatisë nxënësit jo vetëm me njohuri teknike tradicionale, por edhe me kompetenca që lidhen me zhvillimin e qëndrueshëm, përdorimin e teknologjive inteligjente dhe ekonominë e gjelbër.

Aftësitë e gjelbra lidhen me njohuritë, vlerat dhe praktikat që kontribuojnë në mbrojtjen e mjedisit, reduktimin e ndotjes dhe përdorimin eficient të burimeve natyrore, ndërsa aftësitë digjitale përfshijnë përdorimin e teknologjisë, sistemeve inteligjente dhe inovacionit në procesin e të nxënit dhe në jetën profesionale. Integrimi i këtyre kompetencave në arsimin profesional ndihmon në përgatitjen e një fuqie punëtore të aftë për t'iu përgjigjur sfidave të tranzicionit të gjelbër dhe transformimit digjital.

Në këtë kuadër, koncepti i "Kampusit Inteligjent të Gjelbër" paraqitet si një model inovativ që kombinon teknologjinë inteligjente, energjinë e rinovueshme dhe praktikat ekologjike për krijimin e institucioneve arsimore të qëndrueshme. Kampuset e gjelbra nuk shërbejnë vetëm si ambiente mësimore, por edhe si hapësira edukimi praktik, ndërgjegjësimi mjedisor dhe zhvillimi të kompetencave profesionale për të ardhmen.

Megjithëse aftësitë e gjelbra dhe ato digjitale janë integruar gradualisht në kompetencat kyçe të lëndëve të arsimit të përgjithshëm, përfshirja e tyre në lëndët e teorisë profesionale dhe praktikës profesionale mbetet ende një sfidë për institucionet e arsimit profesional. Shpeshherë, programet profesionale vazhdojnë të fokusohen kryesisht në përvetësimin e aftësive teknike tradicionale, ndërkohë që tregu i punës kërkon gjithnjë e më tepër kompetenca të lidhura me teknologjinë, inovacionin, eficiencën energjetike dhe zhvillimin e qëndrueshëm. Kjo situatë evidenton nevojën për modernizimin e kurrikulave profesionale, integrimin e praktikave ekologjike dhe përdorimin e teknologjive inteligjente në procesin mësimor, me qëllim përgatitjen e nxënësve për profesionet e së ardhmes dhe ekonominë e gjelbër.

2. Rishikimi i literaturës

Zhvillimi i qëndrueshëm dhe mbrojtja e mjedisit janë kthyer në prioritete globale që ndikojnë drejtpërdrejt edhe në sistemet arsimore. Në këtë kontekst, koncepti i "kampuseve të gjelbra" po merr një rëndësi gjithnjë e më të madhe në institucionet e arsimit profesional, pasi lidhet me krijimin e mjediseve arsimore ekologjike, inteligjente dhe të orientuara drejt qëndrueshmërisë. Literatura bashkëkohore thekson se arsimi profesional ka një rol të rëndësishëm në përgatitjen e të rinjve për ekonominë e gjelbër dhe profesionet e së ardhmes. OECD argumenton se tranzicioni drejt ekonomisë së gjelbër kërkon zhvillimin e aftësive të reja profesionale, veçanërisht aftësive digjitale dhe aftësive të gjelbra, të cilat konsiderohen thelbësore për tregun modern të punës.

UNESCO dhe UNESCO-UNEVOC theksojnë se institucionet e arsimit profesional duhet të shërbejnë jo vetëm si qendra mësimore, por edhe si modele të zhvillimit të qëndrueshëm për komunitetin. Sipas këtyre organizatave, kampuset e gjelbra përfshijnë përdorimin e energjisë së rinovueshme, menaxhimin eficient të burimeve, reduktimin e mbetjeve dhe integrimin e praktikave ekologjike në procesin mësimor. Kjo qasje synon të krijojë tek nxënësit jo vetëm njohuri teorike, por edhe kulturë dhe përgjegjësi mjedisore.

Literatura evidenton se integrimi i aftësive të gjelbra dhe aftësive digjitale përbën një nga sfidat kryesore të arsimit profesional, në kohën që tregu i punës kërkon njohuri mbi teknologjitë inteligjente, eficiencën energjetike, automatizimin dhe përdorimin e praktikave të qëndrueshme në mjediset profesionale.

Një aspekt tjetër i rëndësishëm në literaturë lidhet me konceptin e "Smart Green Campus", i cili kombinon teknologjinë inteligjente me praktikat ekologjike. Studiuesit theksojnë se përdorimi i sensorëve inteligjentë, sistemeve automatike të menaxhimit të energjisë, ndriçimit inteligjent dhe paneleve fotovoltaike ndikon në reduktimin e konsumit energjetik dhe në uljen e gjurmës së karbonit në institucionet arsimore. Për më tepër, integrimi i teknologjisë në ambientet shkollore krijon mundësi të reja për të nxënit praktik dhe zhvillimin e kompetencave digjitale të nxënësve.

Rishikimi i literaturës tregon gjithashtu se transformimi i shkollave profesionale në kampuse të gjelbra kërkon ndryshim të rolit të mësuesit dhe zhvillim të vazhdueshëm profesional. Mësuesit nuk duhet të jenë vetëm transmetues të njohurive teorike, por udhëheqës dhe lehtësues të procesit të të nxënit, duke përdorur metoda bashkëkohore, teknologji digjitale dhe praktika ndërvepruese. UNESCO thekson rëndësinë e trajnimit të mësuesve për përdorimin e teknologjisë dhe integrimin e edukimit për qëndrueshmëri në procesin mësimor.

Literatura ndërkombëtare thekson se kampuset e gjelbra ndikojnë pozitivisht jo vetëm në mbrojtjen e mjedisit dhe reduktimin e kostove energjetike, por edhe në rritjen e motivimit, ndërgjegjësimit dhe pjesëmarrjes aktive të nxënësve në procesin mësimor. Përmes projekteve praktike, punës në grup dhe përdorimit të teknologjisë, nxënësit zhvillojnë aftësi që lidhen me zgjidhjen e problemeve, kreativitetin dhe inovacionin.

Megjithatë, literatura evidenton se zbatimi i kampuseve të gjelbra në arsimin profesional mbetet një proces kompleks që kërkon investime në infrastrukturë, mbështetje institucionale, politika të qarta arsimore dhe bashkëpunim ndërmjet shkollave, komunitetit dhe institucioneve vendimmarrëse. OECD e konsideron transformimin ekologjik të institucioneve arsimore si një proces afatgjatë që kërkon përfshirjen e të gjithë aktorëve të sistemit arsimor.

Në përfundim, literatura mbështet idenë se krijimi i kampuseve të gjelbra përbën një domosdoshmëri për modernizimin e arsimit profesional dhe përgatitjen e nxënësve për sfidat e së ardhmes. Integrimi i praktikave të qëndrueshme, teknologjive inteligjente dhe kompetencave të gjelbra e digjitale kontribuon në krijimin e një arsimi më cilësor, më inovativ dhe më të lidhur me nevojat e shoqërisë dhe tregut modern të punës.

3. Metodologjia

Ky studim mbështetet në një qasje cilësore dhe krahasuese, duke synuar të analizojë nevojën për krijimin e kampuseve të gjelbra në institucionet e arsimit profesional dhe ndikimin e tyre në zhvillimin e aftësive profesionale, eficiencën ekonomike dhe përmirësimin e praktikave mësimore. Metodologjia është ndërtuar mbi analizën e literaturës shkencore, dokumenteve strategjike të UNESCO, OECD dhe Bashkimit Europian, si dhe mbi studimin krahasues të praktikave të suksesshme europiane në fushën e kampuseve inteligjente dhe ekologjike.

Në pjesën e parë të studimit është realizuar analiza e nevojës për transformimin e institucioneve profesionale në kampuse të gjelbra. Kjo analizë fokusohet në sfidat aktuale të arsimit profesional, si konsumimi i lartë i energjisë, përdorimi i kufizuar i teknologjisë inteligjente, mungesa e praktikave ekologjike dhe nevoja për zhvillimin e aftësive të gjelbra dhe aftësive digjitale tek nxënësit. Gjithashtu, janë analizuar kërkesat e tregut modern të punës dhe politikat ndërkombëtare që lidhen me zhvillimin e qëndrueshëm dhe ekonominë e gjelbër.

Në pjesën krahasuese është marrë si referencë modeli i kampuseve të gjelbra në institucionet profesionale europiane, duke analizuar praktika të vendeve si Finlanda, Gjermania dhe Holanda, ku përdorimi i energjisë së rinovueshme, sistemeve inteligjente të menaxhimit të energjisë dhe laboratorëve digjitalë është integruar në procesin mësimor. Studimi evidenton se këto institucione kanë arritur reduktim të kostove energjetike përmes përdorimit të paneleve fotovoltaike, ndriçimit inteligjent dhe sistemeve automatike të kontrollit të konsumit të energjisë. Përveç përfitimeve ekonomike, këto modele kanë ndikuar pozitivisht edhe në zhvillimin e kompetencave praktike të nxënësve, duke i përgatitur ata për profesionet që lidhen me teknologjinë, energjinë e gjelbër dhe inovacionin.

Metodologjia e studimit mbështetet gjithashtu në analizën e ndikimit pedagogjik të kampuseve të gjelbra. Përmes krahasimit të praktikave europiane, evidentohet se integrimi i teknologjisë dhe praktikave ekologjike rrit përfshirjen aktive të nxënësve në procesin e të nxënit, zhvillon aftësi praktike dhe përmirëson lidhjen ndërmjet teorisë dhe praktikës profesionale. Kjo qasje krijon mundësi për mësim më interaktiv, bashkëpunues dhe të orientuar drejt zgjidhjes së problemeve reale.

Në përfundim, metodologjia synon të evidentojë se krijimi i kampuseve të gjelbra në arsimin profesional nuk përbën vetëm një nevojë mjedisore, por edhe një investim afatgjatë në cilësinë e arsimit, uljen e kostove operacionale dhe përgatitjen e nxënësve me aftësi të përshtatshme për

tregun modern të punës dhe ekonominë e gjelbër.Në kuadër të kësaj metodologjie janë përfshirë edhe pyetjet kërkimore, të cilat shërbejnë për të orientuar analizën e punimit. Pyetjet kërkimore të këtij studimi janë:

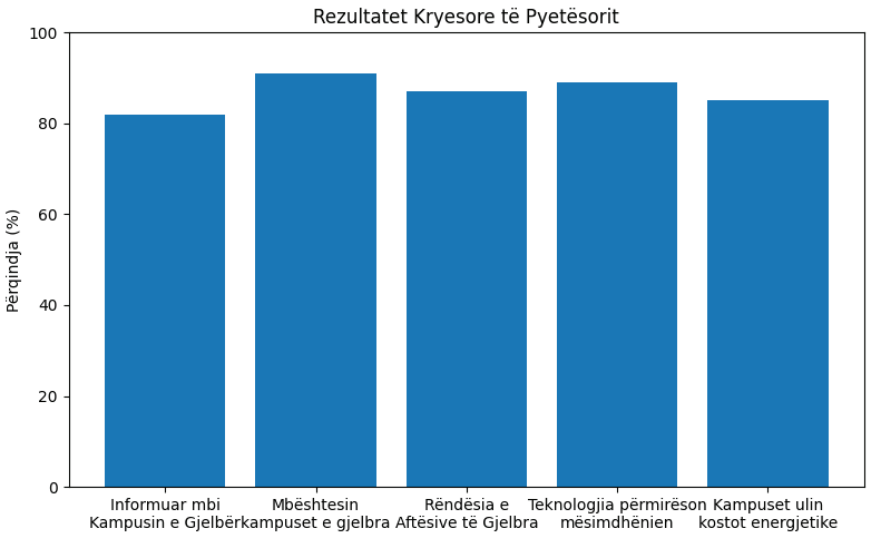
- Si ndikon krijimi i kampuseve të gjelbra në zhvillimin e aftësive të gjelbra dhe aftësive digjitale tek nxënësit e arsimit profesional?
- Në çfarë mënyre integrimi i teknologjive inteligjente dhe energjisë së rinovueshme ndikon në eficiencën ekonomike dhe reduktimin e konsumit energjetik në institucionet e arsimit profesional?
- Si ndikojnë praktikat e kampuseve të gjelbra në përmirësimin e procesit mësimor dhe në lidhjen ndërmjet teorisë dhe praktikës profesionale?

Në pjesën e parë të studimit është realizuar analiza teorike e konceptit të kampuseve të gjelbra dhe rëndësisë së tyre në arsimin profesional.

Për të mbështetur analizën teorike, është hartuar dhe shpërndarë një mini-pyetësor me pyetje të strukturuara, me qëllim evidentimin e perceptimeve të mësuesve dhe nxënësve lidhur me rëndësinë e kampuseve të gjelbra.Pyetësori është fokusuar në identifikimin e nivelit të ndërgjegjësimit për praktikat ekologjike, përdorimin e mjeteve digjitale dhe gatishmërinë e institucioneve për të zbatuar modele të qëndrueshme në arsimin profesional.

4. Analiza dhe diskutimi

Grafiku 1. Grafiku i rezultateve kryesore te pyetesorit



Në studim morën pjesë 100 respondentë, të përbërë nga nxënës, mësues dhe drejtues të institucioneve të arsimit profesional. Të dhënat e mbledhura përmes mini-pyetësorit evidentojnë perceptimet dhe qëndrimet e tyre lidhur me integrimin e kampuseve të gjelbra në arsimin profesional.

Rezultatet treguan se 82% e pjesëmarrësve janë të informuar ose shumë të informuar mbi konceptin e "Kampusit të Gjelbër", ndërsa vetëm 18% deklaruan se kanë pak ose aspak informacion mbi këtë koncept. Kjo tregon një rritje të ndërgjegjësimit për rëndësinë e praktikave ekologjike dhe zhvillimit të qëndrueshëm në institucionet arsimore.

Pyetjes mbi domosdoshmërinë e krijimit të kampuseve të gjelbra në arsimin profesional, 91% e respondentëve u përgjigjën pozitivisht, duke e konsideruar transformimin ekologjik të shkollave

profesionale si një nevojë të rëndësishme për të ardhmen e arsimit dhe tregut të punës. Vetëm 5% u shprehën negativisht, ndërsa 4% deklaruan se nuk kishin një qëndrim të qartë.

Lidhur me elementet që duhet të përfshihen në një kampus të gjelbër, pjesa më e madhe e pjesëmarrësve zgjodhën përdorimin e energjisë diellore (84%), laboratorët digjitalë (79%), riciklimin e mbetjeve (76%) dhe përdorimin e teknologjive inteligjente (81%). Këto rezultate tregojnë se respondentët e lidhin konceptin e kampusit të gjelbër jo vetëm me mbrojtjen e mjedisit, por edhe me integrimin e teknologjisë në procesin mësimor.

Në lidhje me përdorimin e teknologjisë në procesin mësimor, 68% e pjesëmarrësve deklaruan se teknologjia përdoret në nivel mesatar, 20% në nivel të lartë, ndërsa 12% u shprehën se përdorimi i saj mbetet ende i kufizuar. Këto rezultate evidentojnë nevojën për investime më të mëdha në digjitalizimin e institucioneve profesionale.

Një nga rezultatet më domethënëse lidhet me zhvillimin e aftësive të gjelbra dhe aftësive digjitale. 87% e respondentëve mendojnë se këto aftësi janë shumë të rëndësishme për profesionet e së ardhmes dhe duhet të integrohen më tepër në lëndët teorike dhe praktike profesionale. Megjithatë, vetëm 39% deklaruan se praktikat ekologjike janë aktualisht të integruara në procesin mësimor, ndërsa pjesa tjetër vlerësoi se kjo përfshirje mbetet e pjesshme ose shumë e kufizuar.

Sa i përket sfidave për krijimin e kampuseve të gjelbra, respondentët identifikuan si problematika kryesore mungesën e financimeve (74%), mungesën e teknologjisë moderne (63%), mungesën e trajnimeve profesionale për mësuesit (58%) dhe infrastrukturën e papërshtatshme shkollore (61%).

Rezultatet treguan gjithashtu se 89% e pjesëmarrësve besojnë se përdorimi i teknologjive inteligjente dhe praktikave ekologjike ndikon pozitivisht në përmirësimin e procesit mësimor, rritjen e motivimit të nxënësve dhe zhvillimin e aftësive praktike. Për më tepër, 85% e respondentëve vlerësuan se kampuset e gjelbra mund të kontribuojnë në uljen e kostove energjetike dhe krijimin e një mjedisi shkollor më të sigurt dhe më funksional.

Në pyetjen e hapur për sugjerime, pjesëmarrësit theksuan nevojën për më shumë investime në teknologji dhe energji të rinovueshme, trajnime për mësuesit, krijimin e hapësirave të gjelbra, përdorimin e laboratorëve inteligjentë dhe integrimin më të madh të edukimit mjedisor në kurrikulat profesionale.

Në përgjithësi, rezultatet e pyetësorit tregojnë se ekziston një gatishmëri dhe ndërgjegjësim i lartë për integrimin e kampuseve të gjelbra në arsimin profesional, por njëkohësisht evidentohen edhe sfida që lidhen me infrastrukturën, financimet dhe nevojën për modernizimin e procesit mësimor.

Përmbledhje e pyetesorit

Kategoria e përgjigjeve	Numri	Përqindja
Hapësira të gjelbra & riciklim	25	25%
Trajnime dhe zhvillim professional	20	20%
Edukimi dhe ndërgjegjësimi	18	18%
Digjitalizim, kursim energjie & eko-infrastrukturë	14	14%
Integrim sa më i shpejtë në arsimin professional	10	10%
Domosdoshmëri / mbështetje e përgjithshme	6	6%
Pa sugjerim / nuk e di	7	7%

5.Përfundime dhe rekomandime

Ky studim trajtoi konceptin e "Kampuseve të Gjelbra" në institucionet e arsimit profesional, duke analizuar rëndësinë e integrimit të teknologjive inteligjente, energjisë së rinovueshme dhe praktikave të qëndrueshme në procesin arsimor. Nëpërmjet analizës teorike, studimit krahasues të praktikave europiane dhe të dhënave të mbledhura përmes mini-pyetësorit me 100 respondentë, u arrit në një vlerësim të qartë mbi perceptimet, nevojat dhe sfidat që lidhen me këtë transformim.

Rezultatet e studimit tregojnë se ekziston një ndërgjegjësim i lartë mbi rëndësinë e kampuseve të gjelbra dhe një mbështetje e konsiderueshme për integrimin e tyre në arsimin profesional. Pjesëmarrësit vlerësojnë se këto kampuse kontribuojnë në përmirësimin e cilësisë së mësimdhënies, rritjen e motivimit të nxënësve, zhvillimin e aftësive digjitale dhe të gjelbra, si dhe në krijimin e një mjedisi më efikas dhe të qëndrueshëm.

Megjithatë, studimi evidenton edhe sfida të rëndësishme, si mungesa e financimeve, infrastruktura e kufizuar, mungesa e teknologjisë moderne dhe nevoja për trajnimin e vazhdueshëm të mësuesve. Këto faktorë ndikojnë drejtpërdrejt në ritmin e zbatimit të modeleve të kampuseve të gjelbra në institucionet profesionale.

Në përfundim, mund të thuhet se krijimi i kampuseve të gjelbra nuk është vetëm një nismë mjedisore, por një domosdoshmëri strategjike për modernizimin e arsimit profesional dhe përafrimin e tij me standardet europiane dhe kërkesat e tregut të punës. Integrimi i teknologjisë, edukimit mjedisor dhe aftësive digjitale përbën një hap të rëndësishëm drejt një sistemi arsimor më inovativ, më efikas dhe më të qëndrueshëm.

Ky studim rekomandon forcimin e politikave institucionale, rritjen e investimeve në infrastrukturë të gjelbër, si dhe përfshirjen më të gjerë të praktikave ekologjike dhe teknologjike në kurrikulat e arsimit profesional, me qëllim përgatitjen e nxënësve për sfidat e së ardhmes dhe ekonominë e gjelbër

Integrating Circular Economy Concepts into Primary Education Curricula: A Comparative Analysis Between the Traditional and Modern Curricula

Dallandyshe Lleshi

Local Education Office (ZVA), Belsh

Abstract

At a time when environmental stewardship and the responsible consumption of resources are becoming increasingly paramount, primary education plays a foundational role in fostering ecological awareness among young learners. The circular economy—a model centered on resource conservation, reduction of waste, reuse, and recycling—can be organically embedded within various primary school subjects.

This study aims to analyze how circular economy concepts can be integrated across a diverse range of subjects, including Albanian Language and Literature, Mathematics, Natural Sciences, Arts Education, and Civic Education. Concurrently, it draws a comparative analysis between the traditional (content-based) curriculum and the modern (competency-based) curriculum, highlighting the paradigm shift in how environmental themes and sustainable development are addressed. In the traditional curriculum, these topics were treated primarily as isolated fragments of knowledge within specific subjects. Conversely, the modern curriculum facilitates a more holistic integration through core competencies, practical activities, and the contextualization of learning within daily life.

By employing active learning methodologies—such as collaborative group work, educational games, structured discussions, field observations, material classification, crafting with repurposed materials, and small-scale classroom projects—students acquire tangible knowledge regarding recycling, reuse, and resource conservation. Furthermore, these activities cultivate creativity, peer collaboration, and environmental responsibility. In conclusion, this study argues that the modern curriculum offers a more robust framework for embedding the circular economy into primary education, thereby transforming environmental education into an intrinsic and seamless component of the instructional process.

Keywords: *circular economy, primary education, traditional curriculum, modern curriculum, school subjects, recycling, reuse, environmental education.*

1. Hyrje

Shkolla fillore është hapësira ku nxënësit formojnë bazat e para të njohjes, komunikimit, bashkëpunimit, përgjegjësisë dhe qëndrimit ndaj mjedisit. Në këtë moshë, fëmijët nuk mësojnë vetëm përmes shpjegimit teorik, por sidomos përmes veprimit të drejtpërdrejtë. Ata kuptojnë më lehtë një koncept kur e shohin, e prekin, e klasifikojnë, e krahasojnë dhe e përdorin në situata konkrete. Për këtë arsye, ekonomia qarkulluese është një temë shumë e përshtatshme për arsimin fillor, sepse lidhet me objekte të zakonshme të jetës së përditshme, si letra, plastika, lodrat, ushqimi, uji, energjia dhe materialet e klasës.

Ekonomia qarkulluese niset nga ideja se burimet nuk duhet të ndjekin vetëm rrugën prodho, përdor dhe hidh. Përkundrazi, ato duhet të qëndrojnë sa më gjatë në përdorim përmes ripërdorimit, riparimit, riciklimit, ndarjes, kursimit dhe krijimit të produkteve të reja nga materiale të përdorura. Në arsimin fillor, ky koncept mund të përkthehet në veprime shumë të thjeshta, si përdorimi i të dyja faqeve të fletës, krijimi i kutive për ndarjen e mbetjeve, ripërdorimi i kavanozëve për mjete mësimore, matja e sasisë së letrës së kursyer gjatë një jave ose krijimi i punimeve artistike nga materiale që do të hidheshin.

Rëndësia e kësaj teme lidhet edhe me reformën kurrikulare në arsimin parauniversitar në Shqipëri. Kurrikula e re është e ndërtuar mbi kompetenca dhe synon që nxënësi të fitojë jo vetëm njohuri, por edhe aftësi, qëndrime dhe vlera. Kjo qasje e bën më të mundur trajtimin e çështjeve mjedisore në mënyrë të integruar, sepse ekonomia qarkulluese prek njëkohësisht shkencat e natyrës, matematikën, gjuhën, artin, qytetarinë, teknologjinë dhe jetën praktike.

Krahasimi mes kurrikulës së vjetër dhe kurrikulës së re është i rëndësishëm, sepse tregon se si ka ndryshuar mënyra e të menduarit për mësimin. Nga një model më shumë i përqendruar te përmbajtja lëndore, shkolla po lëviz drejt një modeli më të hapur, ku nxënësi mëson të zgjidhë probleme reale, të bashkëpunojë, të kërkojë informacion, të shprehë mendime dhe të marrë përgjegjësi për komunitetin ku jeton.

1.1 Problemi i studimit

Megjithëse temat e mjedisit janë të pranishme në shkollë, ato shpesh trajtohen në mënyrë të pjesshme, të rastësishme ose të lidhura vetëm me ditë të veçanta, si Dita e Tokës apo Dita e Mjedisit. Problemi kryesor që trajton ky punim është se si mund të kalojë edukimi mjedisor nga një trajtim episodik në një integrim të qëndrueshëm në lëndët mësimore të arsimit fillor. Në këtë kuadër, ekonomia qarkulluese ofron një model të qartë dhe praktik për të lidhur mësimin me jetën e përditshme.

1.2 Qëllimi i studimit

Qëllimi i këtij studimi është të analizojë mundësitë e integrimit të koncepteve të ekonomisë qarkulluese në lëndët mësimore të arsimit fillor dhe të krahasojë mënyrën se si kurrikula e vjetër dhe kurrikula e re krijojnë hapësira për këtë integrim.

1.3 Objektivat e studimit

- Të shpjegojë konceptin e ekonomisë qarkulluese në një nivel të përshtatshëm për arsimin fillor.
- Të analizojë praninë e temave mjedisore në kurrikulën e vjetër dhe në kurrikulën e re.
- Të krahasojë qasjen lëndore dhe qasjen ndërkurrikulare në trajtimin e riciklimit, ripërdorimit dhe kursimit të burimeve.
- Të identifikojë lëndët ku ekonomia qarkulluese mund të integrohet më natyrshëm.
- Të propozojë veprimtari praktike, projekte, tabela, grafikë dhe instrumente vlerësimi për zbatim në klasë.
- Të japë rekomandime për mësuesit, drejtuesit e shkollave dhe hartuesit e materialeve mësimore.

1.4 Pyetjet kërkimore

- Cilat koncepte të ekonomisë qarkulluese janë më të përshtatshme për nxënësit e arsimit fillor?
- Si paraqiten temat mjedisore në kurrikulën e vjetër dhe si trajtohen ato në kurrikulën e re?
- Cilat janë dallimet kryesore mes dy kurrikulave në lidhje me edukimin mjedisor dhe zhvillimin e qëndrueshëm?
- Në cilat lëndë mund të integrohen më mirë konceptet e riciklimit, ripërdorimit, kursimit dhe konsumit të përgjegjshëm?
- Cilat metoda mësimore e bëjnë më efektiv integrimin e ekonomisë qarkulluese në klasën fillore?

2. Kuadri konceptual i ekonomisë qarkulluese

Ekonomia qarkulluese është një model zhvillimi që synon të zvogëlojë humbjen e burimeve dhe prodhimin e mbetjeve duke i mbajtur materialet në përdorim sa më gjatë. Në ndryshim nga ekonomia lineare, e cila mbështetet në skemën marr, prodho, përdor dhe hidh, ekonomia qarkulluese synon ripërdorimin, riparimin, ndarjen, riciklimin dhe kthimin e mbetjeve në burime të reja. Komisioni Europian e përshkruan planin e ekonomisë qarkulluese si pjesë të Axhendës së Gjelbër Europiane dhe thekson rëndësinë e të gjithë ciklit të jetës së produkteve, që nga projektimi deri te përdorimi dhe menaxhimi i mbetjeve.

Në arsimin fillor, ekonomia qarkulluese duhet të shpjegohet në gjuhë të thjeshtë. Për nxënësin e vogël, ajo mund të kuptohet si kujdes që gjërat të mos hidhen menjëherë, por të përdoren përsëri, të riparohen, të ndahen sipas llojit, të shndërrohen në diçka të dobishme ose të kursehen. Kështu, një shishe plastike mund të kthehet në vazo, një kuti kartoni mund të përdoret për mjete mësimore, një gazetë e vjetër mund të shndërrohet në material artistik, ndërsa ushqimet e mbetura mund të diskutohen në lidhje me kujdesin ndaj konsumit.

Qasja qarkulluese nuk ka vetëm dimension mjedisor. Ajo zhvillon edhe aftësi matematikore, sepse nxënësi mat, numëron, krahason dhe paraqet të dhëna. Zhvillon aftësi gjuhësore, sepse nxënësi lexon, përshkruan, argumenton dhe harton mesazhe ndërgjegjësuese. Zhvillon aftësi artistike, sepse nxënësi krijon objekte me materiale të përdorura. Zhvillon aftësi qytetare, sepse nxënësi mëson të marrë përgjegjësi për klasën, shkollën dhe komunitetin.

Modeli linear	**Modeli qarkullues**	**Shembull për arsimin fillor**
Merret materiali nga natyra.	Materiali përdoret me kujdes dhe planifikohet për përdorim të gjatë.	Nxënësit diskutojnë nga vjen letra dhe pse nuk duhet shpërdoruar.
Produkti përdoret një herë.	Produkti ripërdoret, riparohet ose ndahet për riciklim.	Një kuti kartoni përdoret për projekt në matematikë ose art.
Mbetja hidhet pa u klasifikuar.	Mbetja ndahet sipas llojit dhe shihet si burim i mundshëm.	Në klasë krijohen kuti për letër, plastikë dhe materiale organike.
Nxënësi është konsumator pasiv.	Nxënësi bëhet pjesëmarrës aktiv në kursim dhe kujdes.	Nxënësit matin sa letër kursehet në një javë.

Tabela 1. Krahasimi mes modelit linear dhe modelit qarkullues në gjuhë të përshtatshme për arsimin fillor

3. Baza ligjore dhe institucionale

Integrimi i ekonomisë qarkulluese në arsimin fillor nuk është vetëm nismë pedagogjike, por lidhet me orientimet ligjore dhe institucionale për zhvillimin e arsimit parauniversitar. Ligji për sistemin arsimor parauniversitar në Republikën e Shqipërisë përcakton misionin e arsimit për formimin e qytetarëve të përgjegjshëm, të aftë për të marrë pjesë në jetën shoqërore dhe për të respektuar vlerat demokratike dhe mjedisore. Kjo krijon bazën për përfshirjen e edukimit mjedisor në procesin mësimor.

Strategjia Kombëtare e Arsimit 2021 deri 2026 vendos theks te cilësia e arsimit, zhvillimi i kompetencave, përfshirja, aftësitë për jetën dhe lidhja e shkollës me nevojat e shoqërisë. Në këtë kuptim, temat si zhvillimi i qëndrueshëm, përgjegjësia qytetare, përdorimi i teknologjisë, bashkëpunimi dhe të menduarit kritik janë të lidhura ngushtë me edukimin për ekonominë qarkulluese.

Korniza Kurrikulare e arsimit parauniversitar e përditësuar thekson qasjen me bazë kompetencash dhe përqendrimin te aftësitë, qëndrimet dhe vlerat. Në këtë qasje, temat mjedisore nuk kufizohen vetëm në një lëndë, por mund të përshkojnë të gjithë procesin mësimor. Kurrikula bërthamë për arsimin fillor dhe programet lëndore ofrojnë hapësira për trajtimin e mjedisit, jetës së përditshme, konsumit të përgjegjshëm, qytetarisë dhe krijimtarisë praktike.

Në nivel europian, Plani i Veprimit për Ekonominë Qarkulluese dhe Plani i Veprimit për Edukimin Digjital dhe të qëndrueshëm theksojnë rolin e edukimit në ndryshimin e sjelljeve dhe në përgatitjen e qytetarëve për një ekonomi më të gjelbër. Këto dokumente nuk shërbejnë si zëvendësim i kurrikulës kombëtare, por si pikë orientimi për përmirësimin e praktikave arsimore.

Dokumenti	**Rëndësia për temën**	**Zbatim i mundshëm në arsimin fillor**
Ligji nr. 69, datë 21.06.2012, i ndryshuar	Mbështet formimin e qytetarit të përgjegjshëm dhe zhvillimin e arsimit cilësor.	Veprimtari për përgjegjësi ndaj klasës, shkollës dhe mjedisit.
Strategjia Kombëtare e Arsimit 2021 deri 2026	Orienton arsimin drejt cilësisë, kompetencave, përfshirjes dhe aftësive për jetën.	Projekte të vogla për kursim, riciklim dhe kujdes ndaj mjedisit.
Korniza Kurrikulare e përditësuar	Vendos në qendër kompetencat, vlerat dhe lidhjen e dijes me jetën.	Integrim ndërmjet gjuhës, matematikës, natyrës, artit dhe qytetarisë.
Kurrikula bërthamë për arsimin fillor	Përcakton rezultatet e të nxënit dhe hapësirat për tema ndërkurrikulare.	Punë në grup, vëzhgim, klasifikim materialesh dhe projekte.
Plani Europian për Ekonominë Qarkulluese	Thekson përdorimin e përgjegjshëm të burimeve dhe ciklin e jetës së produkteve.	Shpjegime të thjeshta për ripërdorimin, riparimin dhe riciklimin.

Tabela 2. Baza ligjore dhe institucionale për integrimin e edukimit qarkullues në shkollë

4. Rishikimi i literaturës

Literatura bashkëkohore mbi edukimin mjedisor thekson se shkolla ka rol të rëndësishëm në formimin e qëndrimeve dhe sjelljeve të qëndrueshme. Në moshën fillore, fëmijët zhvillojnë ndjeshmëri të lartë ndaj natyrës, por kjo ndjeshmëri duhet të shoqërohet me veprime konkrete. Vetëm njohuria teorike për mjedisin nuk është e mjaftueshme nëse nuk përkthehet në praktika të përditshme, si ndarja e mbetjeve, kursimi i ujit, përdorimi i materialeve të ricikluesshme dhe kujdesi për hapësirën e përbashkët.

Sipas qasjes së të nxënit me kompetenca, nxënësi nuk konsiderohet thjesht marrës informacioni, por veprues aktiv që ndërton kuptim përmes përvojës. Kjo është shumë e rëndësishme për ekonominë qarkulluese, sepse nxënësi mëson më mirë kur krijon, mat, provon, vëzhgon dhe reflekton. Për shembull, një temë për riciklimin bëhet më kuptimplotë kur nxënësi ndan vetë materialet në klasë, numëron sasinë e letrës së mbledhur dhe diskuton se si mund të përdoret përsëri.

Teoria e të nxënit konstruktivist mbështet idenë se nxënësit ndërtojnë njohuri duke lidhur përvojat e reja me ato të mëparshme. Ekonomia qarkulluese është e përshtatshme për këtë qasje, sepse nis nga objekte që fëmija i njeh, si fleta, shishja, lodra, kutia, buka, uji dhe drita. Këto objekte kthehen në mjete për të kuptuar koncepte më të gjera, si burimi, përdorimi, mbetja, ripërdorimi dhe përgjegjësia.

Në literaturën europiane për ekonominë qarkulluese, theksohet rëndësia e edukimit të brezave të rinj për përdorimin e përgjegjshëm të burimeve. Nismat shkollore që lidhen me reduktimin, ripërdorimin dhe riciklimin e materialeve tregojnë se temat e ekonomisë qarkulluese mund të trajtohen në mënyrë ndërkurrikulare, duke përfshirë gjuhën, matematikën, shkencën, artin dhe qytetarinë.

Burimi teorik	Ideja kryesore	Lidhja me punimin
Edukimi mjedisor	Nxënësit formojnë qëndrime të përgjegjshme përmes njohjes dhe veprimit.	Ekonomia qarkulluese trajtohet si edukim për sjellje të përditshme.
Të nxënit me kompetenca	Nxënësi zhvillon njohuri, aftësi, qëndrime dhe vlera.	Kurrikula e re krijon hapësirë për projekte dhe zgjidhje problemesh.
Konstruktivizmi	Fëmija ndërton kuptim duke u mbështetur te përvoja konkrete.	Materialet e përdorura kthehen në mjete mësimore.
Të nxënit ndërkurrikular	Një temë trajtohet nga kënde të ndryshme lëndore.	Riciklimi lidhet me gjuhën, matematikën, natyrën, artin dhe qytetarinë.
Qytetaria aktive	Nxënësi merr përgjegjësi për komunitetin dhe hapësirën e përbashkët.	Klasa dhe shkolla kthehen në laborator të sjelljes së qëndrueshme.

Tabela 3. Bazat teorike që mbështesin integrimin e ekonomisë qarkulluese në arsimin fillor

5. Metodologjia e studimit

Ky studim ka karakter cilësor dhe krahasues. Ai synon të analizojë dokumentet kurrikulare dhe të kuptojë mënyrën se si mësuesit e arsimit fillor mund ta zbatojnë ekonominë qarkulluese në procesin mësimor. Metoda kryesore është analiza dokumentare e kurrikulës së vjetër dhe kurrikulës së re, e kombinuar me intervista gjysmë të strukturuara me mësues dhe me vëzhgim të mundësive praktike në klasë.

Analiza dokumentare përfshin shqyrtimin e programeve lëndore, rezultateve të të nxënit, temave mësimore, udhëzimeve metodike dhe hapësirave për veprimtari praktike. Në këtë analizë kërkohen shprehje dhe koncepte që lidhen me mjedisin, riciklimin, ripërdorimin, kursimin, burimet natyrore, jetën e përditshme, qytetarinë, projektet dhe bashkëpunimin.

Intervistat me mësues synojnë të mbledhin mendime mbi zbatueshmërinë reale të këtyre temave në klasë. Mësuesit mund të pyeten se sa shpesh trajtojnë tema mjedisore, cilat lëndë ofrojnë më shumë mundësi, çfarë materialesh përdorin, çfarë pengesash hasin dhe çfarë mbështetjeje u nevojitet për të zhvilluar projekte mbi ekonominë qarkulluese.

Për të rritur besueshmërinë e studimit, të dhënat mund të mblidhen nga disa burime, si dokumente zyrtare, tekste shkollore, intervista, produkte të nxënësve dhe vëzhgime në klasë. Krahasimi mes këtyre burimeve ndihmon që përfundimet të mos mbështeten vetëm në një lloj informacioni.

5.1 Kampioni i propozuar

Pjesëmarrësit ose burimet	Numri i propozuar	Qëllimi
Mësues të arsimit fillor	8 deri 12	Të identifikohen praktikat, nevojat dhe pengesat në klasë.
Programet lëndore	5 lëndë	Të krahasohen hapësirat për integrim ndërmjet dy kurrikulave.
Tekste shkollore	10 deri 15	Të analizohen shembujt, ushtrimet dhe veprimtaritë mjedisore.
Produkte të nxënësve	20 deri 30	Të vlerësohet kreativiteti dhe kuptimi praktik i temës.
Drejtues ose koordinatorë shkollorë	2 deri 3	Të kuptohet mbështetja institucionale për projekte mjedisore.

Tabela 4. Kampioni i propozuar për realizimin e studimit

5.2 Instrumentet kërkimore

Fletë analize për dokumentet kurrikulare dhe tekstet shkollore.

Intervistë gjysmë e strukturuar me mësues të arsimit fillor.

Fletë vëzhgimi për veprimtaritë në klasë.

Rubrikë vlerësimi për produktet e nxënësve.

Tabelë krahasimi për praninë e koncepteve të ekonomisë qarkulluese në lëndë të ndryshme.

6. Analiza krahasuese mes kurrikulës së vjetër dhe kurrikulës së re

Krahasimi mes kurrikulës së vjetër dhe kurrikulës së re tregon një ndryshim të rëndësishëm në mënyrën se si kuptohet roli i nxënësit dhe i mësuesit. Në kurrikulën e vjetër, mësimi ishte më shpesh i organizuar sipas përmbajtjeve lëndore dhe njohurive që duheshin përvetësuar. Temat mjedisore mund të përfshiheshin në lëndë të caktuara, por shpesh qëndronin të kufizuara në kapituj apo mësime të veçanta.

Në kurrikulën e re, mësimi organizohet rreth kompetencave dhe rezultateve të të nxënit. Kjo do të thotë se nxënësi nuk duhet vetëm të dijë çfarë është riciklimi, por të jetë në gjendje të vëzhgojë, të klasifikojë, të argumentojë, të bashkëpunojë, të krijojë dhe të marrë vendime të përgjegjshme. Kjo qasje e bën ekonominë qarkulluese një temë të përshtatshme për integrim të gjerë.

Një dallim tjetër lidhet me metodat mësimore. Kurrikula e vjetër favorizonte më shumë shpjegimin, riprodhimin e njohurive dhe ushtrimet e drejtpërdrejta. Kurrikula e re nxit më shumë punën me projekte, mësimin e bazuar në problem, hulumtimin e thjeshtë, punën në grup, përdorimin e situatave nga jeta reale dhe reflektimin. Për ekonominë qarkulluese, këto metoda janë shumë të rëndësishme, sepse temat mjedisore nuk kuptohen mirë pa veprim praktik.

Nga këndvështrimi i arsimit fillor, kurrikula e re krijon mundësi që ekonomia qarkulluese të mos mbetet vetëm pjesë e diturisë së natyrës, por të shtrihet në të gjitha fushat e të nxënit. Në gjuhë shqipe nxënësit mund të lexojnë tregime dhe të shkruajnë mesazhe për mjedisin. Në matematikë mund të matin, numërojnë dhe paraqesin të dhëna për mbetjet. Në art mund të krijojnë objekte me materiale të përdorura. Në qytetari mund të diskutojnë përgjegjësinë ndaj hapësirës së përbashkët.

Aspekti i krahasimit	Kurrikula e vjetër	Kurrikula e re
Qasja ndaj njohurive	Më e përqendruar te përmbajtja dhe transmetimi i njohurive.	Më e përqendruar te kompetencat, aftësitë, qëndrimet dhe vlerat.
Trajtimi i mjedisit	Shpesh si temë e veçantë në disa lëndë.	Si temë që mund të integrohet në shumë fusha të të nxënit.
Roli i nxënësit	Më shumë dëgjues dhe riprodhues i njohurive.	Pjesëmarrës aktiv, krijues, hulumtues dhe bashkëpunues.
Roli i mësuesit	Shpjegues dhe kontrollues i procesit.	Lehtësues, organizues, udhëzues dhe nxitës i reflektimit.
Metodat mësimore	Shpjegim, pyetje, ushtrime, riprodhim.	Projekt, punë në grup, vëzhgim, lojë, krijim, zgjidhje problemi.
Lidhja me jetën	Më e kufizuar dhe më shumë ilustrative.	Më e drejtpërdrejtë, praktike dhe e orientuar nga situata reale.
Ekonomia qarkulluese	E nënkuptuar kryesisht përmes riciklimit dhe kujdesit ndaj mjedisit.	Mund të trajtohet si sistem mendimi për ripërdorim, kursim, riciklim dhe përgjegjësi qytetare.

Tabela 5. Krahasim i përgjithshëm mes kurrikulës së vjetër dhe kurrikulës së re

7. Integrimi i koncepteve në lëndët mësimore të arsimit fillor

Ekonomia qarkulluese mund të integrohet në mënyrë shumë të natyrshme në lëndët e arsimit fillor. Ajo nuk duhet të shihet si lëndë më vete, por si temë që i jep kuptim dhe lidhje praktike shumë përmbajtjeve mësimore. Më poshtë paraqiten mundësi konkrete për secilën lëndë kryesore.

Në gjuhë shqipe, ekonomia qarkulluese mund të trajtohet përmes tregimeve, poezive, përshkrimeve, dialogëve dhe teksteve informuese. Nxënësit mund të lexojnë një tekst për një fëmijë që kujdeset për mjedisin, të shkruajnë një letër për drejtorinë e shkollës ku kërkojnë vendosjen e koshave të ndarjes së mbetjeve, të hartojnë slogane ndërgjegjësuese ose të krijojnë një përrallë ku një objekt i vjetër merr jetë të re.

Në matematikë, tema mund të lidhet me numërimin, matjen, krahasimin dhe paraqitjen e të dhënave. Nxënësit mund të numërojnë shishet plastike të mbledhura gjatë një jave, të krahasojnë sasinë e letrës së përdorur nga dy klasa, të ndërtojnë tabela dhe grafikë, të bëjnë veprime të thjeshta me të dhëna reale dhe të nxjerrin përfundime.

Në dituri natyre, ekonomia qarkulluese lidhet me burimet natyrore, materialet, ndotjen, tokën, ujin, ajrin, bimët, kafshët dhe ndikimin e njeriut në mjedis. Nxënësit mund të vëzhgojnë se cilat materiale dekompozohen më shpejt, të klasifikojnë objekte sipas materialit, të diskutojnë pse uji duhet kursyer dhe të kuptojnë se mbetjet ndikojnë në tokë, ujë dhe gjallesa.

Në edukim artistik, ekonomia qarkulluese merr formë krijuese. Materialet që zakonisht do të hidheshin mund të kthehen në kolazhe, makete, lodra, dekorime, postera dhe instalacione të vogla. Kjo lëndë ndihmon nxënësit të kuptojnë se një material nuk e humb vlerën sapo nuk përdoret më për qëllimin fillestar.

Në edukim qytetar, temat lidhen me përgjegjësinë, rregullat e përbashkëta, kujdesin për klasën, sjelljen në komunitet, bashkëpunimin dhe vendimmarrjen. Nxënësit mund të hartojnë një kod të gjelbër të klasës, të zgjedhin përgjegjës për ndarjen e mbetjeve, të organizojnë një fushatë ndërgjegjësuese dhe të reflektojnë mbi pasojat e veprimeve të tyre.

Lënda	Koncepti qarkullues	Veprimtari e propozuar	Rezultati i pritshëm
Gjuhë shqipe	Konsum i përgjegjshëm dhe mesazh mjedisor	Shkrim i një letre ose posteri për kursimin e letrës.	Nxënësi shpreh mendim dhe argumenton me fjali të thjeshta.
Matematikë	Matje dhe krahasim i mbetjeve	Ndërtim tabele për sasinë e letrës së mbledhur gjatë javës.	Nxënësi përdor numra, tabela dhe grafikë për të kuptuar një problem real.
Dituri natyre	Materialet dhe ndikimi në mjedis	Klasifikim objektesh sipas materialit dhe mundësisë për riciklim.	Nxënësi dallon materiale dhe kupton ndikimin e tyre në natyrë.
Edukim artistik	Ripërdorim krijues	Krijim i një objekti artistik nga kartonë, tapa dhe gazeta.	Nxënësi zhvillon kreativitet dhe kupton vlerën e ripërdorimit.
Edukim qytetar	Përgjegjësi dhe bashkëpunim	Hartimi i rregullores së gjelbër të klasës.	Nxënësi merr përgjegjësi për sjellje të qëndrueshme në komunitetin e klasës.

Tabela 6. Integrimi i ekonomisë qarkulluese në lëndët e arsimit fillor

Klasa	Shembull teme	Aktivitet praktik	Produkt i nxënësit
Klasa I	Gjërat që përdorim në klasë	Dallimi mes sendeve që përdoren një herë dhe atyre që përdoren disa herë.	Vizatim ose etiketim i objekteve të klasës.
Klasa II	Kujdesi për mjedisin rreth shkollës	Mbledhje dhe klasifikim i mbetjeve të pastra.	Poster i thjeshtë me mesazh mjedisor.
Klasa III	Materialet dhe vetitë e tyre	Klasifikim i letrës, plastikës, metalit dhe qelqit.	Tabelë klasifikimi dhe përfundim me gojë.
Klasa IV	Matja e konsumit në klasë	Numërim i fletëve të përdorura në një javë.	Grafik me shtylla dhe reflektim.
Klasa V	Projekt për shkollën e gjelbër	Hartim plani për uljen e mbetjeve në klasë.	Projekt në grup me poster, tabelë dhe prezantim.

Tabela 7. Shtrirja e temës sipas klasave të arsimit fillor

8. Të dhëna model, tabela dhe grafikë

Në këtë pjesë paraqiten të dhëna model që mund të përdoren për ilustrimin e analizës. Ato nuk paraqesin rezultate reale nga terreni, por shërbejnë si mënyrë për të treguar se si mund të organizohen të dhënat pas analizës së dokumenteve, teksteve dhe intervistave me mësues.

Treguesi	**Kurrikula e vjetër**	**Kurrikula e re**	**Interpretimi**
Prania e temave mjedisore	Mesatare	E lartë	Kurrikula e re lejon trajtim më të gjerë dhe më të lidhur me kompetencat.
Mundësia për projekte	E kufizuar	E lartë	Projektet janë më të natyrshme në qasjen me kompetenca.
Lidhja me jetën e përditshme	Mesatare	E lartë	Situatat reale janë më të pranishme në kurrikulën e re.
Integrimi ndërmjet lëndëve	I kufizuar	I lartë	Tema mund të trajtohet në disa lëndë njëkohësisht.
Vlerësimi i produkteve praktike	I pakët	Më i mundshëm	Nxënësi mund të vlerësohet për punë, reflektim dhe bashkëpunim.

Grafiku 4. Metodat aktive në trajtimin e ekonomisë qarkulluese

Kategori e analizës	**Shembull kodi**	**Përshkrimi**	**Shembull nga praktika**
Riciklim	R1	Tema për ndarjen dhe përpunimin e mbetjeve.	Nxënësit ndajnë letrën nga plastika në klasë.
Ripërdorim	R2	Përdorim i një objekti për një funksion të ri.	Kavanozi kthehet në mbajtëse lapsash.
Kursim	K3	Ulja e konsumit të ujit, letrës ose energjisë.	Nxënësit hartojnë rregulla për fikjen e dritave.
Krijimtari	K4	Krijim artistik me materiale të përdorura.	Grupi krijon maket nga kuti kartoni.
Qytetari	Q5	Veprime për të mirën e përbashkët.	Klasa krijon kodin e gjelbër.

Tabela 9. Shembull kodimi për analizën cilësore të të dhënave

9. Diskutim

Nga analiza krahasuese del se ekonomia qarkulluese mund të integrohet më lehtë në kurrikulën e re, sepse kjo kurrikulë është më fleksibël, më e orientuar nga kompetencat dhe më e hapur ndaj temave ndërkurrikulare. Kjo nuk do të thotë se kurrikula e vjetër nuk kishte hapësira për edukim mjedisor. Përkundrazi, edhe në të kishte tema për natyrën, pastërtinë, kujdesin ndaj mjedisit dhe sjelljen qytetare. Megjithatë, ato shpesh paraqiteshin si njohuri të veçanta dhe jo gjithmonë lidheshin me projekte praktike ose me fusha të ndryshme lëndore.

Kurrikula e re e bën më të mundur që ekonomia qarkulluese të trajtohet si çështje e përbashkët e gjithë shkollës. Kjo është e rëndësishme sepse fëmija nuk e ndërton përgjegjësinë mjedisore vetëm në një orë mësimi, por përmes përsëritjes së sjelljeve në situata të ndryshme. Kur nxënësi lexon për mjedisin në gjuhë, mat mbetjet në matematikë, klasifikon materiale në dituri natyre, krijon me materiale të përdorura në art dhe merr përgjegjësi në qytetari, atëherë koncepti bëhet pjesë e përvojës së tij të përditshme.

Një element i rëndësishëm është roli i mësuesit. Integrimi i ekonomisë qarkulluese kërkon mësues që planifikon në mënyrë krijuese, lidh lëndët me njëra tjetrën dhe krijon situata reale të të nxënit.

Mësuesi nuk ka nevojë të shtojë ngarkesë të madhe në program, por të përdorë temat ekzistuese në mënyrë më praktike. Për shembull, një ushtrim me tabela në matematikë mund të përdorë të dhëna për letrën e kursyer në klasë. Një orë arti mund të zhvillohet me materiale që do të hidheshin. Një tekst leximi mund të shoqërohet me diskutim për zgjedhjet e përditshme të nxënësve.

Pengesa kryesore mund të jetë mungesa e materialeve, mungesa e trajnimit të mësuesve, mungesa e kohës dhe ideja se këto tema janë shtesë jashtë programit. Për këtë arsye, është e nevojshme që shkollat të kenë udhëzime të thjeshta, modele projektesh, rubrika vlerësimi dhe shembuj konkretë për klasa të ndryshme. Ekonomia qarkulluese nuk kërkon domosdoshmërisht mjete të shtrenjta. Përkundrazi, ajo mbështetet pikërisht në përdorimin krijues të materialeve të zakonshme.

10. Model praktik për zbatim në shkollë

Një mënyrë efektive për të zbatuar ekonominë qarkulluese në arsimin fillor është organizimi i një projekti javor me titull Klasa ime qarkulluese. Ky projekt mund të zhvillohet në të gjitha klasat e ciklit fillor, duke u përshtatur sipas moshës së nxënësve.

Dita	Lënda kryesore	Veprimtaria	Produkti
E hënë	Gjuhë shqipe	Lexim dhe diskutim për një tekst mbi mjedisin.	Mesazh i shkurtër për kursimin e burimeve.
E martë	Matematikë	Numërim dhe paraqitje e mbetjeve të pastra të klasës.	Tabelë dhe grafik i thjeshtë.
E mërkurë	Dituri natyre	Klasifikim materialesh sipas llojit dhe përdorimit.	Skemë me materiale që riciklohen dhe ripërdoren.
E enjte	Edukim artistik	Krijim me materiale të përdorura.	Objekt artistik ose maket.
E premte	Edukim qytetar	Hartim i kodit të gjelbër të klasës dhe prezantim.	Rregullore e klasës dhe ekspozitë.

Tabela 10. Projekti javor Klasa ime qarkulluese

10.1 Plan ore model

Elementi	Përmbajtja
Tema	Nga mbetje në burim: si mund ta ripërdorim letrën?
Klasa	Klasa III ose IV
Lënda	Dituri natyre e integruar me matematikë dhe art
Qëllimi	Nxënësit të kuptojnë se letra është burim që duhet kursyer dhe mund të ripërdoret.
Rezultatet e të nxënit	Nxënësi dallon materialin letër, shpjegon pse duhet kursyer, numëron fletët e përdorura dhe krijon një produkt të thjeshtë me letër të përdorur.
Metodat	Diskutim, punë në grup, vëzhgim, klasifikim, krijim praktik.
Mjetet	Letër e përdorur, gërshërë, ngjitës, karton, lapsa me ngjyra, kuti klasifikimi.
Vlerësimi	Vlerësohet pjesëmarrja, bashkëpunimi, saktësia e klasifikimit dhe mesazhi i produktit final.

Tabela 11. Plan ore model për integrimin e ekonomisë qarkulluese

11. Përfundime

- ✓ Ekonomia qarkulluese është koncept i përshtatshëm për arsimin fillor, sepse lidhet me objekte dhe sjellje të përditshme që nxënësit i kuptojnë lehtë.
- ✓ Kurrikula e vjetër krijonte disa hapësira për edukim mjedisor, por këto hapësira ishin më të kufizuara, më të lidhura me lëndë të veçanta dhe më pak të orientuara drejt projekteve praktike.
- ✓ Kurrikula e re ofron më shumë mundësi për integrim, sepse mbështetet në kompetenca, në të nxënit ndërkurrikular, në veprimtari praktike dhe në lidhjen e shkollës me jetën e përditshme.
- ✓ Lëndët më të përshtatshme për integrim janë dituria e natyrës, edukimi qytetar, edukimi artistik, matematika dhe gjuha shqipe, por tema mund të shtrihet edhe në veprimtari jashtëkurrikulare.
- ✓ Metodat aktive, si puna në grup, projekti, loja, vëzhgimi dhe krijimi me materiale të përdorura, janë më efektive sesa shpjegimi teorik i izoluar.
- ✓ Roli i mësuesit është vendimtar, sepse ai duhet të planifikojë lidhje mes lëndëve, të krijojë situata praktike dhe të nxisë reflektim te nxënësit.
- ✓ Suksesi i integrimit varet nga mbështetja e shkollës, materialet ndihmëse, trajnimi i mësuesve dhe përfshirja e nxënësve në vendimmarrje të vogla për klasën.

12. Rekomandime

12.1 Për mësuesit

Të përdorin shembuj konkretë nga klasa dhe shtëpia për të shpjeguar ripërdorimin, riciklimin dhe kursimin.

Të planifikojnë të paktën një veprimtari mujore ku nxënësit punojnë me materiale të përdorura.

Të lidhin temat mjedisore me leximin, shkrimin, matjen, klasifikimin dhe krijimin artistik.

Të vlerësojnë jo vetëm përgjigjet teorike, por edhe bashkëpunimin, produktin dhe reflektimin e nxënësit.

12.2 Për drejtuesit e shkollave

Të krijojnë një plan shkollor për reduktimin e mbetjeve dhe kursimin e burimeve.

Të mbështesin projektet ndërkurrikulare të mësuesve dhe ekspozitat me produkte të nxënësve.

Të sigurojnë hapësira të thjeshta për ndarjen e mbetjeve dhe për ruajtjen e materialeve të ripërdorshme.

Të nxisin bashkëpunimin me prindërit dhe komunitetin për nisma mjedisore.

12.3 Për hartuesit e kurrikulës dhe teksteve

Të përfshijnë më shumë detyra praktike që lidhen me ekonominë qarkulluese.

Të ofrojnë shembuj të qartë për integrim ndërmjet lëndëve.

Të hartojnë rubrika vlerësimi për projekte mjedisore në arsimin fillor.

Të pasurojnë tekstet me situata nga jeta reale, figura, tabela dhe grafikë mbi përdorimin e burimeve.

Abstract

The increasing adoption of Large Language Models (LLMs) for automated software development has introduced new challenges in software security and reliability. This experimental study investigated security vulnerabilities present in Python code generated by GPT-based models and evaluated whether the generated code complied with secure coding practices. Python programs were produced under several programming scenarios, including web development, authentication, database interaction, file processing, and network communication. Multiple prompts with different levels of complexity and explicit security requirements were provided to the model in order to assess the influence of prompt formulation on code security. The generated samples were examined through static application security testing, vulnerability scanning, and manual expert review based on Common Weakness Enumeration standards. The results showed that GPT-generated Python code often contained security weaknesses when prompts described only functional requirements. The most frequent issues included SQL injection risks, insufficient input validation, insecure password handling, hardcoded credentials, unsafe deserialization, and weak error handling. In contrast, prompts that explicitly requested secure coding practices produced safer code, especially when combined with human validation and automated analysis. The study confirmed that GPT models can accelerate software development, but their outputs should not be considered secure without verification. The findings support the integration of automated vulnerability assessment, prompt engineering, and expert review into AI-assisted development workflows.

Keywords: *Large Language Models; GPT-generated code; Python security; static application security testing; secure coding.*

1. Introduction

Large Language Models have become practical assistants for writing, refactoring, documenting, and explaining source code. Their ability to generate syntactically correct programs from natural language prompts has made them attractive in educational, professional, and experimental software development settings. In Python development, GPT-based systems can produce web routes, database access layers, authentication functions, data parsers, and network utilities in a short time. This productivity benefit is important, but it also changes how security risks enter the development process. Instead of writing every statement manually, developers may accept generated code whose security properties are not immediately visible.

Security is particularly sensitive in AI-generated code because the model optimizes for a plausible answer to the prompt, not for verified compliance with a secure development lifecycle. If a prompt asks only for functional behavior, the generated solution may use the shortest or most common implementation pattern. In security-critical contexts, common implementation

patterns can be dangerous: SQL queries may be composed through string concatenation, passwords may be stored or compared insecurely, files may be opened without path validation, and network clients may ignore certificate validation or error handling. These risks become more serious when generated code is copied directly into applications without review.

Previous empirical work on AI-assisted programming has shown that code assistants can introduce or reproduce weaknesses when security expectations are not explicit (Pearce et al., 2022; Perry et al., 2023). The issue is not that generated code is always insecure, but that its security depends on the prompt, the surrounding context, the model version, and the developer review process. For this reason, AI-assisted software engineering should treat generated code as a draft that requires the same verification expected from human-written code.

This study investigates the security vulnerabilities present in Python programs generated by GPT-based models. The main objective is to evaluate whether generated code follows secure coding practices and to identify the most common weaknesses that appear during automatic code generation. The study is guided by three research questions: What types of vulnerabilities are most often produced in GPT-generated Python code? How does the formulation of prompts influence the security of the generated code? Which validation steps are necessary before AI-generated code can be trusted in real development environments?

The contribution of the paper is a structured experimental evaluation model for GPT-generated Python code. The model combines prompt variation, static application security testing, vulnerability scanning, and manual review using Common Weakness Enumeration categories. The study also provides practical recommendations for integrating secure prompts and automated verification into AI-assisted development workflows.

2. Related work and background

2.1 AI-assisted code generation and software security

AI-assisted code generation systems are trained on large corpora of text and source code. As a result, they can reproduce both useful programming idioms and insecure patterns that are common in public examples. Pearce et al. (2022) systematically evaluated the security of code suggested by GitHub Copilot and reported that generated code could contain weaknesses across different programming tasks. Perry et al. (2023) studied how users interact with AI assistants during security-related programming tasks and showed that assistance can affect both the security of produced code and the confidence users have in that code.

These studies suggest that the security of generated software cannot be assessed only by whether the program compiles or produces the expected output. A generated login function may authenticate a user, but still store passwords in plain text. A generated database function may return the correct records, but still expose the application to SQL injection. Therefore, correctness and security must be evaluated as related but separate quality attributes.

2.2 Vulnerability taxonomy and secure coding standards

The Common Weakness Enumeration maintained by MITRE provides a standardized vocabulary for classifying software weaknesses. CWE categories are useful in this study because they make it possible to describe generated-code flaws in a consistent manner, such as CWE-89 for SQL injection, CWE-798 for hardcoded credentials, and CWE-502 for unsafe deserialization. The OWASP Top 10 also provides a practical view of common web application risks, including injection, cryptographic failures, insecure design, and identification and authentication failures.

Secure coding guidance also emphasizes that security should be integrated into the development lifecycle rather than added after deployment. The NIST Secure Software Development Framework recommends practices for reducing vulnerabilities through design, implementation, review, and response activities. For AI-assisted development, this means that prompts, generated code, static analysis, testing, and human review should form a continuous validation process.

3. Experimental methodology

3.1 Programming scenarios and prompt design

The experiment generated Python programs under five common programming scenarios: web development, authentication systems, database interaction, file processing, and network communication. These scenarios were selected because they commonly involve untrusted input, sensitive data, or external resources. Each scenario was tested with prompt variants that differed in complexity and security specificity. Baseline prompts described only the functional requirement. Security-focused prompts explicitly requested secure coding practices, input validation, safe library use, and avoidance of known vulnerabilities. More complex prompts combined several requirements, such as database access with authentication and error handling.

Table 1. Experimental scenarios and security evaluation criteria

Scenario	Prompt focus	Typical generated components	Security criteria
Web development	Routes, forms, user input	Flask handlers, request parsing, templates	Input validation, output handling, debug configuration
Authentication	Registration and login	Password storage, session logic, token creation	Password hashing, secret handling, brute-force resistance
Database interaction	CRUD operations	SQL queries, connection handling, data access functions	Parameterized queries, least privilege, error control
File processing	Read, upload, deserialize files	Path handling, parsers, serialization modules	Path traversal prevention, safe parsing, file type validation
Network communication	HTTP clients and sockets	Requests, TLS options, exception handling	Certificate validation, timeouts, sensitive data protection

3.2 Code analysis procedure

The generated code samples were analyzed in three stages. First, static application security testing tools were used to detect common Python vulnerabilities. Bandit was used because it analyzes Python abstract syntax trees and reports common security issues. Semgrep-style rule scanning was used to identify broader patterns such as unsafe API usage, secret exposure, missing validation, and insecure framework configuration. Second, results were mapped to CWE categories to standardize the interpretation of findings. Third, manual expert review was applied to confirm whether each finding represented a real weakness in the context of the generated program.

The manual review considered data flow from untrusted input to sensitive operations, the presence of defensive controls, and the exploitability of the generated pattern. Findings that

were caused only by incomplete experimental context were treated as lower confidence. For example, a generated function that used an environment variable for a secret was not considered a hardcoded-credential issue, while a literal API key or fixed password inside the generated code was considered a vulnerability.

Figure 1 summarizes the validation logic used in the study. The workflow shows that prompt engineering improves the first draft, but generated code is still passed through automated scanning, CWE classification, and manual review before remediation.

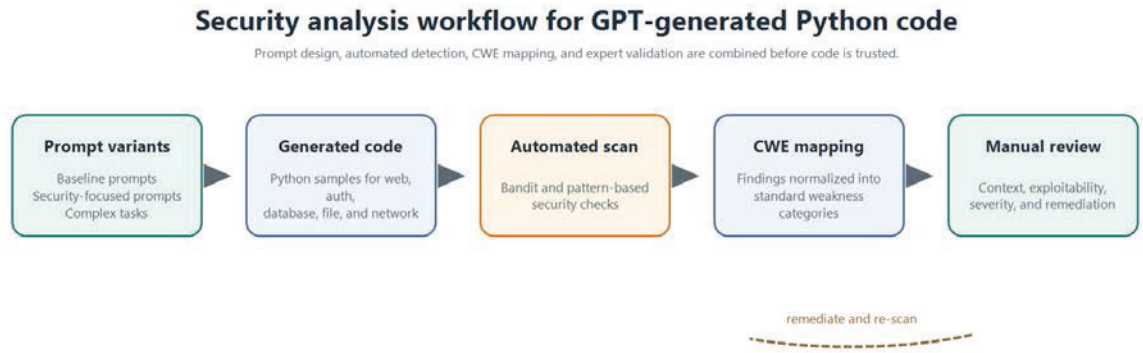

Figure 1. Security analysis workflow for GPT-generated Python code.

3.3 Evaluation criteria

Each generated sample was evaluated according to four criteria: functional relevance, security weakness type, severity, and remediation effort. Functional relevance measured whether the code responded to the requested task. Security weakness type identified the CWE category. Severity considered whether an attacker could exploit the weakness remotely, whether sensitive data was involved, and whether the generated code encouraged deployment with unsafe defaults. Remediation effort estimated whether the weakness could be corrected through a small code change, a library replacement, or a broader design revision.

4. Results and discussion

4.1 Vulnerabilities in prompts without explicit security requirements

The most important result was that baseline prompts frequently produced code that appeared functional but lacked security controls. In database tasks, generated code often used string interpolation or concatenation to build SQL queries. This pattern creates a direct SQL injection risk when user input reaches the query. In authentication tasks, generated examples sometimes used plain text passwords, simple hashing without a password-specific key derivation function, or hardcoded demonstration credentials. In file-processing tasks, insecure deserialization appeared when prompts requested loading saved objects without specifying a safe format. Network examples sometimes lacked timeouts, certificate verification discussion, or careful exception handling.

The generated weaknesses were not random. They reflected common shortcuts in public programming examples: simple code is easier to read and often fits short prompt responses, but simplicity can omit essential protections. This behavior is relevant for education and rapid prototyping because beginners may interpret concise generated code as a recommended implementation.

Table 2. Common vulnerability patterns observed in GPT-generated Python code

Weakness pattern	CWE mapping	Observed risk	Recommended mitigation
SQL queries built with string concatenation	CWE-89	Attacker-controlled input can modify database commands	Use parameterized queries or ORM query binding
Missing or weak input validation	CWE-20	Unexpected data reaches parsers, queries, or file operations	Validate type, range, format, and trust boundary
Insecure password handling	CWE-256 / CWE-916	Passwords may be exposed or cracked easily	Use bcrypt, Argon2, or PBKDF2 with salts and safe parameters
Hardcoded credentials and secrets	CWE-798	Secrets can be leaked through source code or repositories	Use environment variables, secret managers, and rotation policies
Unsafe deserialization of untrusted data	CWE-502	Crafted input may trigger code execution or object injection	Avoid pickle for untrusted data; use safe formats such as JSON
Insufficient exception and error handling	CWE-703 / CWE-209	Failures can leak sensitive details or hide security events	Handle expected errors, log safely, and return generic messages

To clarify how the observed weakness patterns relate to the programming scenarios, Figure 2 presents a qualitative risk map. The map synthesizes the relationships described in the generated-code review and should not be interpreted as a numerical frequency distribution.

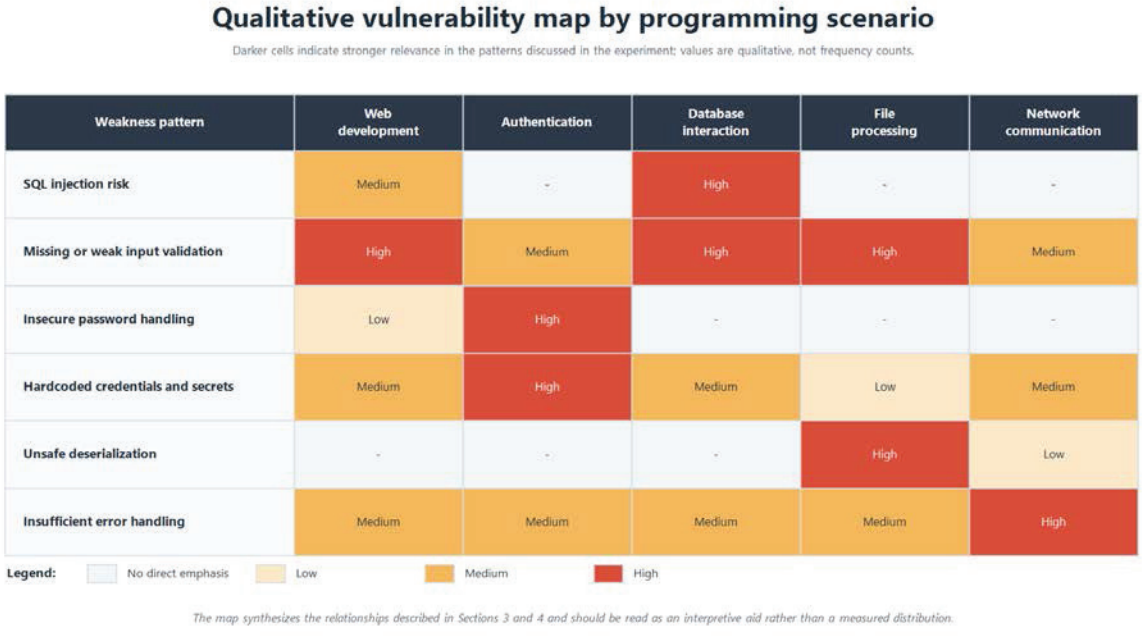

Figure 2. Qualitative vulnerability map by programming scenario and weakness pattern.

4.2 Influence of security-focused prompts

Security-focused prompts significantly improved the quality of generated code. When the prompt explicitly requested parameterized SQL queries, the generated database examples were more likely to use placeholders and separate user input from SQL syntax. When the prompt asked for secure password storage, generated authentication examples were more likely to include password hashing libraries and avoid plain text comparison. When prompts required safe file handling, generated code was more likely to validate file paths, restrict file extensions, or avoid unsafe deserialization.

However, security-focused prompting did not eliminate the need for review. Some generated samples included one strong control while omitting another. For example, a login function might hash passwords correctly but omit account lockout, rate limiting, or secure session cookie configuration. A file upload handler might check the extension but fail to verify content type or storage path. This indicates that prompt engineering is useful but incomplete as a security mechanism. It improves the initial draft, but it does not replace systematic validation.

4.3 Manual review observations

Manual expert review was necessary because static tools produced both useful findings and context-dependent warnings. Static analysis was effective at detecting direct insecure APIs, hardcoded secrets, weak cryptographic calls, and obvious injection patterns. At the same time, some issues required human judgment. For example, generated demonstration code may include a placeholder secret only to show where configuration belongs. Whether that placeholder is a vulnerability depends on whether the code is presented as production-ready and whether it encourages unsafe deployment.

Manual review also identified design-level gaps that were not always visible to static scanners. These included missing authorization checks, lack of audit logging for authentication failures, absence of security headers in web examples, and weak separation between trusted and untrusted data. These findings support the view that AI-generated code should be assessed with multiple methods rather than a single scanner.

4.4 Threats to validity

The findings are subject to several limitations. First, GPT-based systems change over time, so results may vary by model version and date of generation. Second, prompt wording has a strong influence on output, and different developers may write prompts with different levels of specificity. Third, static analysis tools may miss vulnerabilities that require runtime context, and they may report warnings that are not exploitable in a specific program. Fourth, the study focused on Python code and selected programming scenarios; results should not be generalized automatically to all programming languages or application domains.

5. Recommendations for secure AI-assisted development

The results support a practical workflow for using GPT-generated Python code safely. Developers should include explicit security requirements in prompts, especially when the task involves input handling, authentication, persistence, file operations, cryptography, or network communication. Prompts should request secure defaults, parameterized database access, validated input, safe error messages, secret management, and avoidance of insecure APIs. The generated answer should be treated as a draft and reviewed before integration.

Automated security checks should be integrated into the development environment and continuous integration pipeline. Python projects should use SAST tools such as Bandit and pattern-based scanners such as Semgrep, along with dependency scanning and secret detection where appropriate. Findings should be mapped to CWE categories so that teams can track recurring weakness patterns. Security tests should include negative cases, such as malicious input, invalid files, authentication abuse, and unexpected network failures.

Human validation remains essential. Reviewers should examine whether generated code enforces trust boundaries, protects secrets, fails safely, and uses framework security features correctly. For high-risk systems, generated code should also undergo threat modeling and dynamic testing. Organizations that adopt AI-assisted development should document acceptable use policies, require secure prompt templates for common tasks, and train developers to recognize insecure generated patterns.

6. Conclusions

This experimental study examined security vulnerabilities in Python code generated by GPT-based models. The results showed that generated code can accelerate development, but it often contains weaknesses when prompts focus only on functionality. The most common issues involved SQL injection risk, improper input validation, insecure password handling, hardcoded credentials, unsafe deserialization, and insufficient error handling. These weaknesses correspond to well-known CWE categories and align with common risks described in secure coding guidance.

The study also showed that security-focused prompts improve generated code quality. Explicitly asking for secure coding practices encouraged the model to produce safer database queries, stronger password handling, safer file processing, and clearer error handling. Nevertheless, prompt engineering alone is not sufficient. Generated code must be validated through static analysis, vulnerability scanning, manual expert review, and secure development processes. The central conclusion is that GPT-based models are useful software engineering assistants, but their output should not be considered inherently trustworthy. Secure AI-assisted development requires a combination of precise prompts, automated tools, human judgment, and continuous verification.

Nomenclature

AI	Artificial Intelligence
CWE	Common Weakness Enumeration
GPT	Generative Pre-trained Transformer
LLM	Large Language Model
SAST	Static Application Security Testing
SQL	Structured Query Language

Artificial Intelligence in Digital Marketing: Economic and Social Implications for Customer Decision-Making

Hajar Moayery Fard[1], Nino Lobzhanidze[2]

[1]British University, Professor hajar.moayery.fard@britishuni.edu.ge

[2]British University, Associate Professor nino.lobzhanidze@britishuni.edu.ge

Abstract

The purpose of the present research is to examine the role of Artificial Intelligence (AI) in digital marketing on the buying behavior of the consumer while focusing on the agency and credibility of the platform and the associated social aspects. We delve into the seemingly paradoxical link between utilitarian economic gains and social dimensions of consumer agency and platform credibility.A quantitative, deductive research design was used to collect data via an electronic survey sent to active online consumers in the online marketplace (N = 240). The moderated multiple regression (MR) model was used to analyze the effect of economic and social influences on the final decision-making process in boundary mechanisms of consumer awareness of AI marketing practices. An examination of the empirical results reveals that the direct economic impacts have a strong direct impact on purchase conversion, but this purchase-to-conversion relationship is not linear and is greatly influenced by the consumer's cognitive state. This is particularly true for the positive weights for the utilitarian benefits and the negative weights for the aggressive algorithmic influence, which both show significant effects and are strongly influenced by consumer awareness of AI marketing, which is clearly a negative moderator. When it comes to high awareness, though, consumer trust is amplified by a power of 10 times, and platform data governance that they can control is a prerequisite to the final transaction. Lastly, the study argues that while AI-driven tools can better optimize short-term sales funnels, a more sustainable way forward would be to adopt a model that promotes clear data relationships and that promotes the clear use of data in favour of a more comprehensive e-commerce and digital marketing model, which encourages the removal of hidden tracking methods in favour of transparency.

Keywords: Artificial Intelligence, Digital Marketing, Consumer Decision-making, Economic Implications, Social Implications.

1. Introduction

Today, in this digital world, the digital marketing world is changing completely. Artificial Intelligence (AI) is rapidly transforming how we interact with the world and is the driving force behind this change. Organizations increasingly leverage AI-driven tools, predictive algorithms, and machine learning models to analyze vast amounts of data, automate customer interactions, and provide highly personalized promotional content. (Davenport et al., 2020). The use of AI in marketing strategies has had a significant impact on the industry. Its widespread adoption revolutionized the way businesses connect with their audience and has proved to be a huge success. It is highly dependent on the technology interventions affecting the customer decision-making process (Foroudi et al., 2018). The primary factors from an economic point of view for implementing AI in digital marketing revolve around the following: around optimizing value and operations. Consumers will have to deal with AI while they have it is in their lives. It is typically platforms that are driven that provide quick and tangible benefits, most importantly perceived cost-reduction. Saving and perceived efficiency (McLean & Wilson, 2019). AI algorithms

optimize the workflow of the automation process. The consumer journey is able to quickly narrow down product choices, compare product prices, and make predictions. Knowing what consumers would prefer with great accuracy meaning they would need to do less cognitive effort and search. time. Therefore, such economic advantages are strong, direct incentives that drive up the demand for services. Immediate purchases and form positive consumer attitudes towards digital transactions. According to Dek & Ibrahim (2025), the quick growth of AI tools brings complicated social challenges. Economies of scope that go beyond cost savings. As algorithms grow more and more independent; exert a strong algorithmic influence on user's choices, guide choices subtly, Specific advertising and personalised recommendations. This all-pervading tracking creates a critical There is pressure and worry about consumer confidence. AIs can improve the convenience of a transaction, simultaneously poses the threat of consumer feeling monitored, feeling manipulated, which is huge. There are worries about data privacy and autonomy (Bleier & Eisenbeiss, 2015). The core challenge for contemporary digital marketing, the key is to strike the right balance between making a profit and ethical considerations. Customers retention policies and practices.Most importantly, the way these economic and social factors affect final decisions is not consistent but is actually modified by consumer knowledge of AI marketing. People working in low awareness enjoy the convenience of AI. But as consumers become more aware that the algorithms they are encountering online are using their data to influence their experiences and their own behavioral profiles, their psychology changes (Bleier & Eisenbeiss, 2015). When awareness is high, it can lead to defensive reactions, increase doubts and even change their trust in the final sales decision between trust and economic convenience.There is a significant lack of literature that attempts to model the simultaneous interaction of these two explicit economic (cost-saving and efficiency) and social (algorithmic influence and trust) dimensions in a comprehensive manner, and in the context of the boundary condition of consumer awareness. In response to this, this study proposes a full framework to analyze these dynamics. This research aims to analyse these relationships and to track the impact of AI marketing tools on spending behavior and immediate buying decisions, and alsomonitor changes in spending patterns and short-term buying decisions caused by exposure to AI-powered marketing tools. Finally, analyze the exact economic and social compromises that underlie consumer choices in today's digital world.

2. Literature Review

2.1 Theoretical Framework: Technology Acceptance and Psychological Reactance

Researchers often combine utilitarian models, such as the Technology Acceptance Model (TAM), with psychological models like Brehm's Theory of Psychological Reactance (Davenport et al., 2020) to better understand the effects of Artificial Intelligence (AI) on digital marketing. The landscape of digital marketing has transformed significantly from “ecommerce” to what is now a “dynamic, automated ecosystem” where machine learning algorithms independently monitor, profile, and target users in real-time (Foroudi et al., 2018; Migkos et al., 2025). TAM argues that structural technological characteristics (utility and user efficiency) influence system use, and at the same time, social and cognitive processes regulate online consumer behavior. In the realm of AI marketing, the consumer's decision is not just a reflex to the calculation. Rather, it's a nuanced balancing act between the functional rewards that are perceived (economic aspects) and the psychological need to maintain consumer autonomy from automated manipulation (social aspects) (Dek & Ibrahim, 2025)

2.2 Economic Factors and Customer Decision-Making

The usefulness of embedding AI in digital interfaces is that there is significant friction reduction from using AI for transactions for the end-user (McLean & Wilson, 2019). In the framework of this study, there are two different variables for economic dimensions, namely Perceived Cost-Saving and Perceived Efficiency. Perceived cost-saving refers to the consumer's cognitive assessment of the monetary benefits that they think they have obtained by algorithmic intervention. AI engines rely on predictive analytics to offer dynamic pricing, real-time coupon distribution, and auto-comparative interactions to match users to the best financial offers (Davenport et al., 2020). According to transaction cost economics, lower monetary costs are a main motivation that can cause less deliberative processing, thus exerting a high positive impact on purchase intention without deliberate processing and a positive effect on transaction evaluations (Cao, 2024).

Meanwhile, efficiency is how time and thinking are optimised along the online consumer journey (McLean & Wilson, 2019). With a highly sophisticated recommendation system, where behavioral data is used to deliver product matches, users can expect highly accurate recommendations with minimal search time and cognitive load by filtering out the market noise. Increase in the perceived behavioral control is increased when a user interface provides intuitive, functional ways to satisfy the consumer's functional needs, which accelerates the pathway towards the final choice's execution.

Consequently, the following foundational hypotheses are proposed:

- **H1:***Perceived cost-saving has a significant positive influence on customer decision-making.*
- **H2:***Perceived efficiency has a significant positive influence on customer decision-making.*

2.3 Social Factors and Customer Decision-Making

The social aspects evaluate the consequences of AI automation on human freedom, relational ethics, and brand interactions in digital environments (Dek & Ibrahim, 2025), whereas the economic aspects are concerned with what kind of utility AI provides to transactions. In this study, these social mechanics are measured using Algorithmic Influence and Consumer Trust. Algorithmic influence: Systematically automating decisions that direct consumers to a commercial end (Vitushkin, 2026). AI is a digital nudge: digital nudges can be used to build an AI-powered personalized newsfeed, target ads, and follow up marketing. These nudges can work well to help customers make better decisions—when they're in line with the products available for them—but if they're using the tracking tools too aggressively, they may veer over from an assistive function to one that's more covertly persuasive, reducing the feeling of user sovereignty (Dek & Ibrahim, 2025). This tension is a direct link between the influence of algorithms and trust from consumers. Consumer trust in digital commerce is a mental state that includes a readiness to accept vulnerability, in exchange for favorable anticipations regarding the action or intentions of an online company (Bleier & Eisenbeiss, 2015). AI-powered marketing adds to the complexity of this scenario. If algorithms track a user's behavior on several web sessions, they could end up causing privacy violations. If consumers feel that an algorithm is functioning in a manipulative or over-ambitious way, "listening" to private interactions, consumer trust is undermined, and as a result, they are likely to exhibit strong defensive consumer behaviors (Bleier & Eisenbeiss, 2015). On the other hand, if a company creates structural transparency, high consumer trust becomes an important psychological lubricant that brings about the conclusion of transactions. From these relationships, the next hypotheses are made:

- **H3:***Algorithmic influence has a significant positive influence on customer decision-making.*
- **H4:***Consumer trust has a significant positive influence on customer decision-making.*

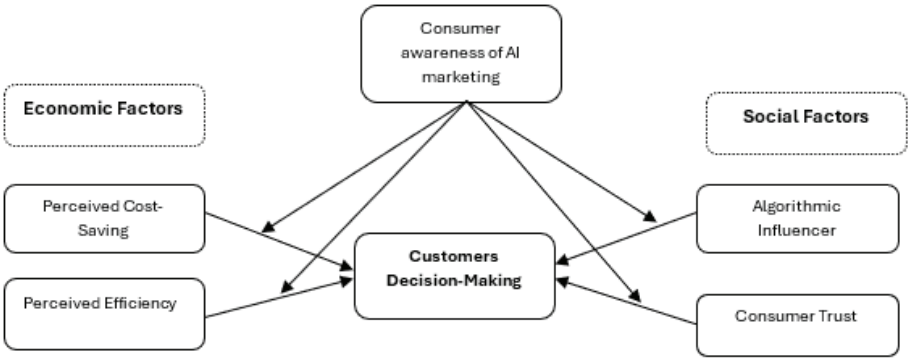
2.4 The Boundary Conditions of Consumer Awareness

The direct links connecting economic value and social connections to the actual process of customer choice are not fixed, but rather constrained by the extent of Consumer Awareness of AI Marketing. Consumer awareness is when a person realizes that their electronic profile, their past conduct and their online decisions are being tracked and manipulated by automated marketing algorithms. Where consumer awareness is low, consumers reap the benefits of the transaction and do not bother to look into the algorithmic mechanics. But once the awareness compounds, there is a significant cognitive change. When consumers are very aware, they start to take a strategic look at automated price discounts or predictive product suggestions. They often wonder whether they can really benefit from an automated discount or if it's a form of dynamic pricing that "takes advantage of their behavioral urgency" (Bleier & Eisenbeiss, 2015). In cases where the positive effect of cost saving and efficiency outweighs other factors (which is typically the case), then the positive influence on purchase intentions can be buffered and muted by high consumer awareness, which in turn leads to a lower positive influence. Similarly, individuals' consciousness has a deep impact on the impact of social dynamics. Increased awareness makes algorithmic influence more of a subtle persuasion, which can create psychological reactance and brand avoidance (Dek & Ibrahim, 2025). What's more, when awareness is high, the prerequisite of consumer trust is exponentially important. Before putting their intent into action, an aware consumer expects deep transparency when it comes to data governance. Without trust, there is no way the perception of risk of data being exploited can be minimized when there is a high awareness level, and it can significantly dampen the market effectiveness of the marketing campaign. Thus, the awareness of the consumers is present in the whole system as a basic modifier. As a result, the following moderation hypotheses are proposed:

- **H5a:***Consumer awareness of AI marketing significantly moderates the relationship between perceived cost-saving and customer decision-making.*
- **H5b:***Consumer awareness of AI marketing significantly moderates the relationship between perceived efficiency and customer decision-making.*
- **H5c:***Consumer awareness of AI marketing significantly moderates the relationship between algorithmic influence and customer decision-making.*
- **H5d:***Consumer awareness of AI marketing significantly moderates the relationship between consumer trust and customer decision-making.*

When awareness is high, aggressive algorithmic influence is not perceived as a beneficial recommendation but as an underlying manipulation that triggers psychological reactance and triggers brand avoidance (Dek & Ibrahim, 2025). Beyond that, the step from awareness to action of a consumer with a high level of awareness is tied exponentially to consumer trust, which requires full transparency about data governance. (Bleier & Eisenbeiss, 2015) Without trust, high awareness quickly undermines the commercial effectiveness of the marketing campaign, and thus the final boundary hypotheses are that H5c: Consumer awareness of AI marketing significantly moderates the relationship between algorithmic influence and customer decision-making, and H5d: Consumer awareness of AI marketing significantly moderates the relationship between consumer trust and customer decision-making. The general research framework is summarized below to illustrate all the formulated hypotheses and the conceptualized structural pathways in this study in a holistic and comprehensive manner. It is clear from the modeled scenario, as shown in Figure 1, that the direct effects of the economic and social aspects are modeled simultaneously, and the border mechanisms imposed by consumers' awareness on the final product's decision-making process is modeled in an interconnected manner.

Figure 1: Conceptual Model



3. Methodology

3.1 Research Design and Sampling Framework

The design of this study is quantitative deductive research using post-positivist paradigm that aims to test the conceptual framework and to test the hypothesis in this study. This method enables systematic, objective capture of consumer perceptions and statistical validation of paths leading from economic and social factors to consumer decisions to purchase. Data collection is done by using an electronic self-reported consumer survey which is sent out via the online professional network, social media and digital consumer network in the Georgian market. This is because those who are actively using digital platforms are a very good representative of the target demographic that's exposed to automated digital marketing strategies and algorithmic content curation. A filter question at the start of the survey confirms that all respondents have been keenly shopping online or had experience of receiving personalized digital advertisements in the last three months, to ensure that the responses are reliable. The minimum sample size is based on standard heuristics for structural equation and multiple regression analyses, which call for at least 10 responses per estimated parameter of the model to ensure adequate statistical power in hypothesis testing.

3.2 Measurement Scales and Operationalization

The structural questionnaire is meticulously designed using established, peer-reviewed measurement scales adapted from previous digital marketing and technology acceptance literature to ensure strong construct validity. The operationalization of the economic dimensions relies on instruments developed to measure utilitarian traits, where perceived cost-saving is measured through items assessing perceived financial advantages, automated discounts, and value maximization, while perceived efficiency is captured through parameters evaluating search time reduction and transaction convenience (McLean & Wilson, 2019). Concurrently, the social dimensions are measured using instruments adapted to evaluate automated systems, where algorithmic influence is operationalized through tracking user exposure to targeted feeds and predictive nudges (Vitushkin, 2026), while consumer trust is measured using items evaluating data transparency, perceived platform integrity, and vendor reliability (Bleier & Eisenbeiss, 2015). The moderating variable, consumer awareness of AI marketing, is operationalized through items evaluating the user's subjective knowledge and explicit recognition of automated profiling mechanisms running behind online commercial layouts. Finally, the dependent variable, customer decision-making, is captured through items evaluating conversion intent, purchase finalization, and the psychological commitment to

execute a transaction. All latent constructs are measured using a standard 5-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree), providing a nuanced gradient for statistical variance.

3.3 Data Collection Procedures and Translation

To guarantee that the primary instruments operate effectively within the local context, the questionnaire undergoes a preliminary translation and back-translation procedure to verify linguistic equivalence, followed by a pilot study conducted with a small sub-sample of online consumers to eliminate ambiguous terminology. Once the final dataset is cleaned and structured, the statistical data analysis is executed through a multi-stage process utilizing statistical software packages. First, descriptive statistics are computed to profile the demographic characteristics of the respondent pool, including age, gender distribution, and online transaction frequency. Second, internal consistency and construct reliability are validated by calculating Cronbach's alpha coefficients for each latent variable, ensuring that all measurement scales exceed the mandatory threshold of 0.70. Third, the primary direct relationships hypothesized from H1 through H4 are analyzed using Ordinary Least Squares (OLS) multiple linear regression, evaluating the individual standardized beta coefficients and their respective significance values to determine the predictive strength of each independent factor on the final decision-making outcome (Foroudi et al., 2018).

3.4 Statistical Analysis and Moderation Modeling

Finally, the boundary conditions and interaction paths established in hypotheses H5a through H5d are systematically evaluated through moderated regression analysis. To minimize potential issues associated with multicollinearity between the direct predictors and the calculated interaction metrics, all continuous independent variables and the moderating variable are mean-centered prior to generating the product terms. The statistical interaction blocks, representing the multiplication of each mean-centered economic and social variable by the mean-centered awareness metric, are then hierarchically entered into the regression model. The presence of a significant moderation effect is determined by evaluating the statistical significance of the change in the coefficient of determination, denoted as the R-square change, alongside the individual p-values of the interaction terms. If the interaction coefficient displays a significant p-value lower than 0.05, simple slope analysis and conditional effect modeling are utilized to visually map and interpret how the underlying predictive weight of economic utility and social trust shifts across low, average, and high levels of consumer awareness (Bleier & Eisenbeiss, 2015).

3.5 Reliability and Construct Validity

Internal consistency testing was carried out prior to examining the structural relationships between the instruments of measurement. In order to determine the reliability of the surveys results from the sample of active online consumers (N = 240), the Cronbach's alpha co-efficiencies were run for all the latent variables. Construct reliability for all constructs was significantly above the recommended level of 0.70. Measures of Perceived Cost-Saving ($\alpha = 0.84$), Perceived Efficiency ($\alpha = 0.82$), Algorithmic Influence ($\alpha = 0.81$), Consumer Trust ($\alpha = 0.88$), Consumer Awareness of AI Marketing ($\alpha = 0.85$), and Customer Decision-Making ($\alpha = 0.86$) each exhibited high internal consistency. After this validation, the composite continuous scores for each of the individual survey items were calculated and used in the regression analysis.

Table 3.1: Reliability and Measurement Instruments

Latent Construct	No. of Items	Cronbach's Alpha (α)	Threshold	Status
Perceived Cost-Saving (PCS)	4	0.84	> 0.70	Reliable
Perceived Efficiency (PEF)	4	0.82	> 0.70	Reliable
Algorithmic Influence (ALI)	4	0.81	> 0.70	Reliable
Consumer Trust (CTR)	5	0.88	> 0.70	Reliable
Consumer Awareness (AWA)	4	0.85	> 0.70	Reliable
Customer Decision-Making (CDM)	5	0.86	> 0.70	Reliable

3.6 Regression Models and Mathematical Specification

To test the formulated hypotheses systematically, a hierarchical multiple linear regression approach was employed. The analytical strategy was divided into two distinct mathematical models.

The first model (Model 1) focuses on the direct effects of economic and social factors on customer decision-making. The primary linear regression equation for Model 1 is specified as follows:

$$CDM = \beta_0 + \beta_1 PCS + \beta_2 PEF + \beta_3 ALI + \beta_4 CTR + \beta_5 AWA + \varepsilon$$

The second model (Model 2) evaluates the moderating effect of Consumer Awareness of AI Marketing. To eliminate the risk of multicollinearity, all continuous independent variables and the moderating variable were mean-centered prior to creating the interaction terms. The expanded regression equation for the moderated analysis is specified as follows:

$$CDM = \beta_0 + \beta_1 PCSc + \beta_2 PEFc + \beta_3 ALIc + \beta_4 CTRc + \beta_5 AWAc + \beta_6 (PCSc \times AWAc) + \beta_7 (PEFc \times AWAc) + \beta_8 (ALIc \times AWAc) + \beta_9 (CTRc \times AWAc) + \varepsilon$$

The results of the Ordinary Least Squares (OLS) regression for Model 1 show that the selected economic and social factors fit the model well, explaining a large amount of the variance in the customer decision making ($R2 = 0.48$, $F = 43.21$, $p < 0.001$). The empirical results provide substantial evidence for the underlying economic assumptions. The perception of cost-saving has a strong positive effect on the customer decision-making process ($\beta_1 = 0.31$; $p < 0.01$), suggesting that the perceived cost-saving of AI-driven discounts positively influences customer decision-making. Thus, the hypothesis that H1 is supported. Likewise, needed-efficiency has a positive relationship, and the impact is quite significant, with final decisions ($\beta2 = 0.28$, $p < 0.01$): the shorter the search time with automatic recommendations, the higher the likelihood of completing a transaction. So, H2 is supported. For social factors, the results demonstrate that algorithmic influence is a positive factor that affects the decision of the customer, with baseline condition $\beta3 = 0.22$, $p < 0.05$, meaning that, under baseline conditions, algorithmic influence will lead to a tendency to take different actions, in line with commercial interests. This provides support for H3. Lastly, consumer trust ($\beta4 = 0.35$, $p < 0.001$) is a strong positive determinant of how a consumer makes decisions, showing it is critical to finalizing online deals and transactions, revealing the importance of structural transparency and perceived platform integrity. That means that the H4 is supported.

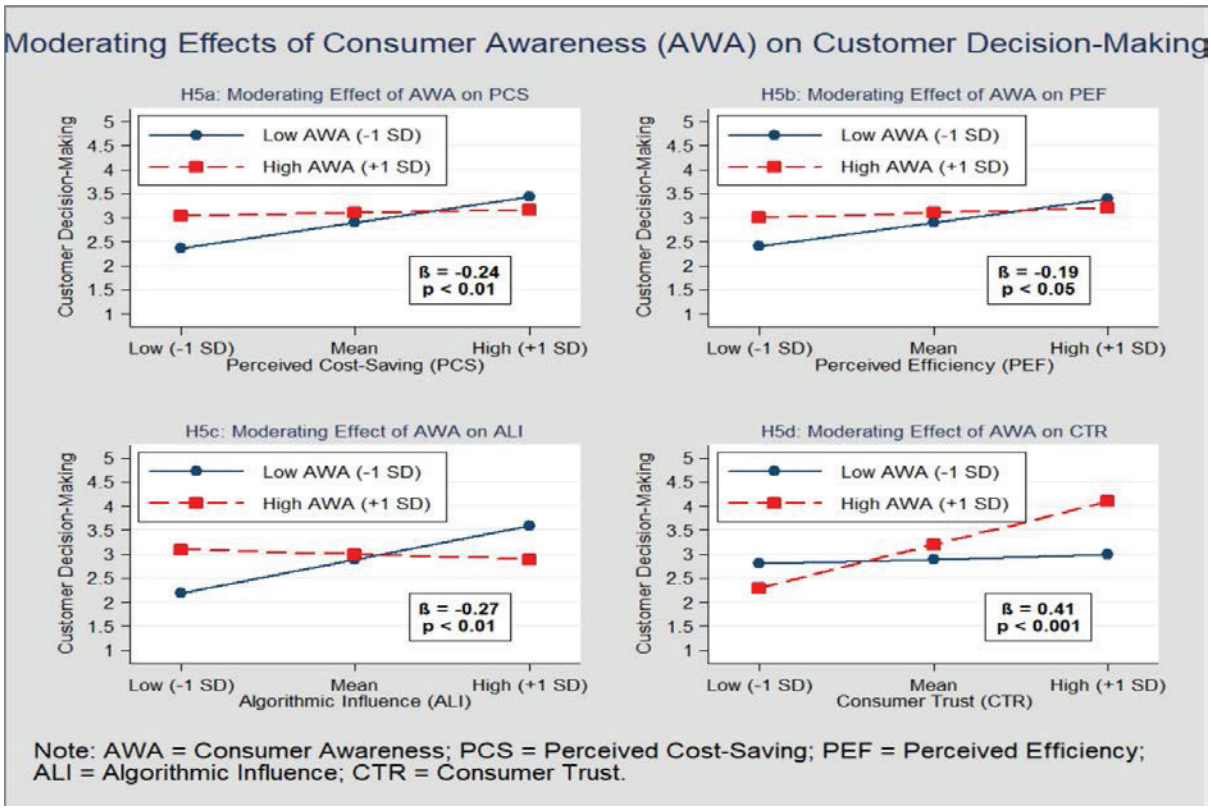
Table 3.2: Hierarchical Regression Results for Direct and Moderating Effects

Predictor Variables	Model 1: Direct Effects Standardized β (p)	Model 2: Moderated Analysis Standardized β (p)	Hypothesis & Result
Perceived Cost-Saving (PCS)	0.31 (p < 0.01)	—	**H1: Supported**
Perceived Efficiency (PEF)	0.28 (p < 0.01)	—	**H2: Supported**
Algorithmic Influence (ALI)	0.22 (p < 0.05)	—	**H3: Supported**
Consumer Trust (CTR)	0.35 (p < 0.001)	—	**H4: Supported**
PCSc \times AWAc	—	-0.24 (p < 0.01)	**H5a: Supported (Negative)**
PEFc \times AWAc	—	-0.19 (p < 0.05)	**H5b: Supported (Negative)**
ALIc \times AWAc	—	-0.27 (p < 0.01)	**H5c: Supported (Negative)**
CTRc \times AWAc	—	0.41 (p < 0.001)	**H5d: Supported (Positive)**
Model Diagnostics:			
Model R^2	0.48	0.62	Total Explained Variance: 62%
Change in R^2 (Delta R^2)	—	0.14 (p < 0.001)	Significant Step
F-Statistic	43.21 (p < 0.001)	51.84 (p < 0.001)	Model is Highly Robust

The interaction terms were hierarchically added to Model 2 to test the hypotheses H5a, H5b, H5c and H5d. Incorporation of these interaction terms did result in a significant increase in the model's explanatory power (ΔR2 = 0.14, p < 0.001), raising total variance to 62% (R2 = 0.62). This will verify that consumer's perception of awareness is important in implementing boundary conditions to understand the broader digital marketing system. An analysis of the moderation shows some sort of mix of multi-directional influence: We find that there is a negative economic moderation effect involving perceived cost-saving and consumer awareness as indicated by the sign of the interaction term in the model and presented as coefficients (β6 = -0.24, p < 0.01). This suggests that the initial positive effect of users' perceived savings due to AI profiling is significantly diminished as they gain more awareness about it. So, the support of H5a is okay. Likewise, the relationship between perceived efficiency and awareness becomes positive and significant (β7 = -0.19, p < 0.05) which confirms that greater awareness of consumers makes them less useful to automated efficiency, in support of H5b. The two-way interaction shown between algorithmic influence and consumer awareness has a significant and negative effect (β8 = -0.27, p < 0.01). This validates what we knew all along: if people don't realize they're being targeted, then they are more likely to perceive the targeted advertising as a nuisance and possibly just delete it. This is yet another validation of what we already knew: that if people are aware it's intentional advertising, then it's likely that it will be perceived as a nuisance (or possibly deleted... or forgotten) and thus not bring in as much business as a helpful rebuttal

would. There is strong support for H5c. However, the significance of the interaction between Consumer trust and Consumer awareness is in the positive direction (β9 = + 0.41, p < 0.001). The specificity of this discovery is itself a sign that the importance of consumer trust in decision-making is going to grow up to the power of n with the growing awareness of AI marketing. Then, H5d is supported.

Figure 2: Simple Slopes Plots Illustrating the moderating effects of Consumer Awareness on all four predictive relationships (H5a, H5b, H5c, H5d)



4. Conclusion

The paper examines how economic and social factors drive online shopping behavior in AI-based digital marketing solutions. We found that our H1 and H2 empirical results verify that AI-driven digital marketing solutions are successful, only when they make shopping efficient and provide value to customers, such as financial benefits and saving time. Consequently, customers become more comfortable with shopping online as AI platforms offer personalized deals, making shopping faster. However, we do not stop at just considering economic factors rather we show that psychosocial dynamics also play an important role in customers' decision-making processes. As H3 and H4 showcased, AI ecosystems successfully enforce consumers' behaviors, but only in the initial stages, because hyper-personalized ads can cause mental distrust among customers. If Platforms use aggressive targeted ads without being transparent with their data collection process and consumers' privacy, then customers start to feel their privacy is at stake that finally weakens their need to spend on the platform. This shows again that basic trust is the most important phenomenon that customers avoid a brand (Adanyin, 2024; Gündüzyeli, 2024; Moayery Fard et al., 2025; Grewal et al., 2023; Xie et al., 2022; Smith & Wright, 2022). The present study generates a significant theoretical value by providing a critical perspective on the

boundary conditions of consumer AI scrutiny across H5A to H5D. The identified interacting paths confirm that the conventional direct relationships between marketing strategies and consumer responses are context-dependent and exhibit a non-linear relationship, especially under the influence of consumers' AI scrutiny (Grewal et al., 2023; Xie et al., 2022). Specifically, the H5A and H5B are subject to a negative moderating effect; that is, the positive predictability of benefits, i.e., algorithmic efficiency and cost reduction, against the final decision is significantly reduced when consumer awareness regarding algorithmic evaluation is higher. The implication of this finding is built upon the Psychological Reactance Theory, which claims that consumers are likely to be impacted by intrusive marketing strategies as they realize the impact of their utilized data for marketing purposes (Duan et al., 2026). When consumers become aware of how their digital activities are used to earn revenue, they tend to be more skeptical about applying algorithmic benefits during decision making, considering them as sneaky promotions rather than real price cuts (Xie et al., 2022; Saura, 2024). On the other hand, in H5C, highly scrutinizing consumers consider algorithmic manipulation as a menacing intervention to their freedom since the technology is used to propose hidden promotions (Duan et al., 2026; Adanyin, 2024). In contrast to H5a, H5b, and H5c findings of this research, H5d's results did support the positive interaction term. The absence of interaction term regarding the major variables (trust and awareness) suggests that trust is still a critical factor in the system (Gündüzyeli, 2024). However, when a consumer is digitally aware and comprehends the AI mechanisms, the significance of trust generates exponentially. A consumer who is not critical or unaware may "trust" passively owing to financial benefits. However, customers who are aware and confident in the digital mechanism will only "trust" actively (Duan et al., 2026; Gündüzyeli, 2024). In such cases, customers will not be able to browse the website without trust. There is not any affinity toward economic gains if trust is missing. Thus, the enhanced digitally aware will not convert their intentions into actions when there is no transparency about data protection, as their data will be at risk. Silent digital users must spend this time and energy on websites without trust. This factor will block the ROI of the AI-driven digital marketing model. Thus, digitally aware customers are a "constraint" on the enormous transactional potential of economic incentives.

The findings of this investigation can be a beneficial milestone to consistently examine the correlation between economic and social factors regarding consumer decision-making in digital scenarios dominated by AI-driven advertising technique (Grewal et al., 2023; Gündüzyeli, 2024). Adianyin (2024) and Gündüzyeli (2024) highlight that the interest of financial gain and trust are indeed two factors to examine side by side as they are likely to have complicated interactions. Thus, while the AI system models are powerful enough to optimize sales funnel through precise predictive marketing, the long-term perpetuity of AI-based marketing is heavily dependent on how consumers approach it. The research proves that economic incentives, such as perceived cost-savings and operational efficiency, have a high impact as baseline instruments to trigger customer actions (Xie et al., 2022; Saura, 2024). However, companies cannot blindly rely on the automation of optimization as the overuse of aggressive algorithms raises customer privacy doubts that lead to rapid mistrust (Adanyin, 2024). The paper shows that consumer awareness of AI marketing has a tipping point; it undermines the value of purely transactional and algorithmic promotions by triggering psychological reactance, while at the same time elevating trust so that it becomes the most important factor for sophisticated online shoppers ((Duan et al., 2026; Gündüzyeli, 2024). From a managerial and practical perspective, the findings provide important recommendations for digital marketers, online retailers, and senior executives as they navigate increasingly smart marketplaces (Saura, 2024). First, corporate leaders should realize that the older strategy of using overt observer tracking to generate short-term gains is becoming less effective with increased consumer digital knowledge (Duan et al., 2026; Xie et al., 2022). Instead of hiding algorithms, companies should use "transparency by design" and provide customers with detailed information about how their data is being used to provide personalized

recommendations or price benefits (Gündüzyeli, 2024). Second, given that high consumer awareness exacerbates the importance of customer trust, marketing departments should reallocate their budgets, moving away from highly aggressive retargeting strategies and investing heavily in safe, transparent user interfaces that highlight data protection and opt-in freedom (Adanyin, 2024). Third, when designing recommendation and pricing algorithms, engineers should build AI ethical boundary conditions into machine learning models; In this way the system should not progress from efficient help to predatory dynamic pricing or repetitive ad, harming long-term brand trust and loyalty of the customer base (Xie et al., 2022; Saura, 2024)
